MEDICAL AND SOCIAL PROBLEMS OF POPULATION—TRENDS AND IMPLICATIONS

CHAIRMAN'S ADDRESS

Walter Lincoln Palmer, M.D., Chicago

The purpose of this paper is to call attention to some f the broader aspects of medicine, particularly those asociated with changes in the size and age structure of the opulation in different areas of the world. These probms vary widely. In the United States, the total population is aging and is still increasing in size, although a ownward trend is probable within the foreseeable fue; Asia struggles with difficulties arising out of multides she cannot easily support; Western Europe is faced ith long-time trends threatening a decline in population. he social scientists have studied these conditions carelly; responsibility for action in an enlightened society es with the individual members and groups.

As man has progressed from the dawn of civilization, is primary concern has always been survival: survival f the individual and survival of the group. This has also een medicine's primary function; life, health and relief f suffering represent the goals of medical science and ractice. Moreover, a very fair measure of success has een achieved. Modern medicine, sanitation, and techology have dramatically reduced the number of deaths rom infectious diseases and have increased the life exectancy in Western society. These and other changes esulting from man's increasing knowledge have created ome of the problems that now so urgently demand soluion.

The modern era in Western civilization should probably be dated from the intellectual, agricultural, commercial, and industrial revolution arising in Western Europe in the 17th and 18th centuries and progressing rapidly in the 19th. Today, at the middle of the 20th cenury, Western Europe and North America are far advanced in the phase of industrial and technological development; Africa and Asia are just beginning to enter this stage; other areas, such as Russia and South America, are in a transitional stage. A close correlation has been demonstrated between these stages of industrial development and three phases of population growth.[1] These are sketched diagrammatically in Chart 1.[1a] First is the phase of preindustrial "high-growth potential" in which the birth and death rates are both high, as in the Orient. The second stage, appearing with the introduction of technological advances, sanitation, and medicine, is a period of "transitional growth" characterized by a declining death rate while the birth rate remains high, thus producing a phenomenal growth in population. The third phase, following the other two, is one of "incipient decline," in which the birth rate falls progressively, producing a trend toward declining total population growth. Western Europe is in this phase. The United States has passed through the first two phases with a rapid population growth (Chart 2); this has been due to a high birth rate, a rapidly decreasing death rate, and heavy immigration.[2] We are approaching the end of this era, as is evident from a study of long-term trends in birth and death rates.

INCREASED LIFE EXPECTANCY IN WESTERN SOCIETY

An interesting estimate (Chart 3) has been constructed of life expectancy in ancient Greece, imperial Rome, medieval England and the United States of today.[3] The estimated average age at death in the time of Pericles was approximately 18 years; in the ensuing 2,000 years it slowly rose to perhaps 33 years, but in the past half century in the United States it has zoomed to almost 70 years. The change has been largely due to the great decrease in deaths from infectious diseases. Decreases in deaths from diphtheria, scarlet fever, whooping cough

and typhoid in New York City in the period from 1868 to 1921 are shown in Chart 4.[4] The lives saved were primarily those in the younger age group. However, progress has been made in the older age group as well, as is clearly shown in Chart 5, with the marked reduction in the death rates from pneumonia and influenza in persons aged 65 years and resulting from the introduction of antibiotic and chemotherapeutic drugs. The principle causes of death have shifted from the infectious to the degenerative and neoplastic diseases (Chart 6). It is not likely that the life expectancy can be extended far beyond 70 years within the near future.

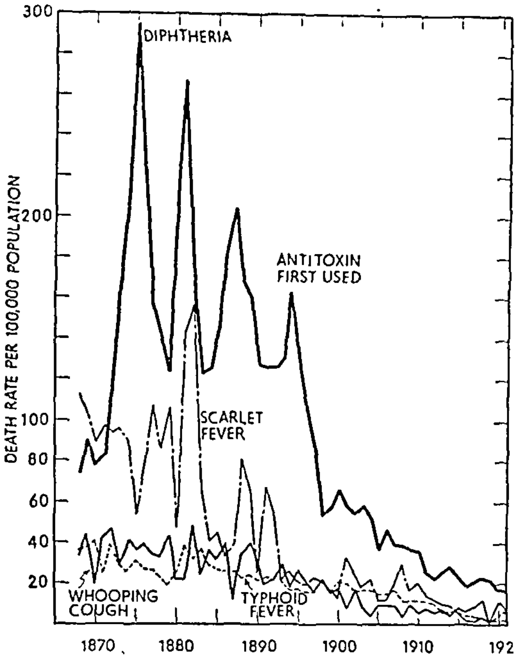

Chart 4.—Death rates per 100,000 population from typhoid, whooping cough, scarlet fever and diphtheria, in New York City, from 1868 to 1921.[4]

THE PROBLEMS OF AN AGING POPULATION

As the proportion and number of older people increases, the associated problems increase. Of these, the foremost is the greater incidence of chronic diseases not causing immediate death, for the percentage of impaired and disabled individuals increases directly with age (Chart 7).[3] Moreover, in addition to physical disability, there are the serious emotional disturbances of old age; senescence is often characterized by frustration, bitterness, and other manifestations of physiological and social maladjustment. Our hope is that we may delay senility rather than prolong it.[5] Ideally, old people should be kept physically well, mentally alert, energetic, and vigorous.

Another aspect of an aging population is the constantly-increasing burden placed upon the wage earners by the growing proportion of aged (Chart 8). Only 8% of our population are now over 65 years of age, but this figure will increase to an estimated 13% in the next half century. It is more difficult to provide care for the aged than it is to provide care for the young because of the higher incidence of physical and mental disability. Our state institutions, already overcrowded, are reserved for the actually incompetent. There is a great need for homes —private, semiprivate, or state—in which elderly groups may live together without being a burden to their families and receive therein such care as may be required.

DECLINING BIRTH RATES

The change in the age-structure of our population has resulted from a decrease in our birth rate even more than from the decrease in the death rate. It is perhaps not sufficiently realized that in most of Western Europe and North America the birth rate has been declining more or less steadily since the latter part of the nineteenth century.[6] The falling birth rate has been well documented in Sweden for the past 70 years (Chart 9); the death rate likewise has fallen; considerable emigration has occurred, and although the total population thus far has not actually decreased, it has a different composition in two important respects: 1. It has a higher percentage of old people; 2. The birth rate is so low that, as the aged die they are not potentially replaced by persons in younger age groups. The net reproduction rate in Sweden is now less than 75% of that required to maintain a population which reproduces itself.[6a] The same situation in general exists or is developing in France, England, Italy and other countries of Western Europe; a similar long-term trend is present in the United States, as may be seen from Chart 10, showing the estimated number of births per 1,000 women of childbearing age.[2]

The question may well be asked as to what measures may be taken to maintain the net reproduction rate at a desired level. It is estimated that in Sweden those married women able to bear children should each have a family of four in order to offset the unmarried and childless women.[6a] The number of childless marriages may be decreased by medical advances, but the effect will probably not be statistically significant. Social pressures may be brought to bear; Germany and Italy under Hitler and Mussolini attempted to increase the birth rates through pronatal policies such as propaganda to remove the stigma attached to the unmarried mother, allowances for maternal and child care, payments of bounties for each child, and other governmental measures. The results of similar programs in democracies, such as Sweden and France, are at present inconclusive.[6a,b] The steps already taken in this country toward maternal and child welfare may be looked upon as indicative of such trends, although for the most part they have been aimed

at the solution of other problems and only indirectly bear on population growth. Furthermore, factors associated with economic prosperity and war increase the birth rate, as was clearly evident in the United States in both World Wars and is still apparent. It is difficult to predict how long the present upsurge will last; in all probability it will spend itself here as in Western Europe in a relatively short time; the downward trend will be resumed, and early in the next century the population is likely to become stationary or may actually begin to decline. If this prediction is fulfilled, our nation will be faced with three possible solutions: stimulation of reproduction, lowering of immigration barriers, or acceptance of gradual decline in population.

PLANNED AND UNPLANNED POPULATION CONTROL IN WEST AND EAST

The population problems of those countries now in the preindustrial or transitional stages are in many ways entirely different from those of Western Europe and North America. The people of the West have learned to restrict population, feed themselves better, house themselves more adequately, and to an increasing degree realize the benefits of leisure and culture. There can be no doubt that the progressive and continued decline in the birth rate has been due in large measure to the voluntary control of conception. The motivation to control the number of births is linked with the rise of industrialization. In a sense, comfort, luxury, security, and leisure have taken precedence over reproduction; this may be regarded as the result of the ascendancy of philosophies emphasizing the welfare of the individual, and the growth of "urbanism as a way of life." [7]

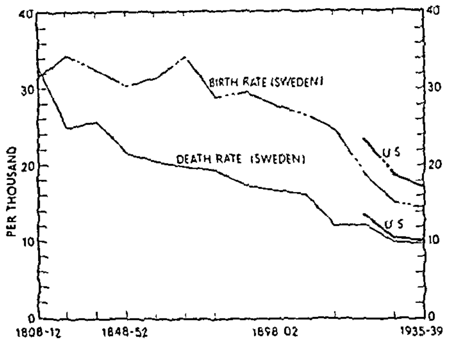

Chart 9.—Crude birth and death rates of Sweden and the United States, 1808 to 1939, based on data from Thompson,[6b] pp. 152 and 217.

From earliest times mankind has resorted to various measures to control the size of the family. Infanticide is perhaps the oldest method; it is still in existence in certain areas. In Western society, it is illegal, and the taboo against it is so strong that reports of its occurrence rarely appear. Abortion, on the other hand, although illegal except for medical indications, is widely used; it is estimated that there are at least one million criminal abortions performed each year in the United States.[8] Obviously, abortion does not carry the same taboo as infanticide, but, nevertheless, the feeling against it is so strong that there is little likelihood that it will ever become a legal or accepted method of birth control. Ultimately, population control must depend on methods of preventing conception. Continence, rhythm, and coitus interruptus may be effective, but the general dissatisfaction with these methods in the United States is evident from the popularity of contraceptive devices. Surgical sterilization by means of castration, tubal ligation, hysterectomy or vasectomy is not popular for obvious reasons.

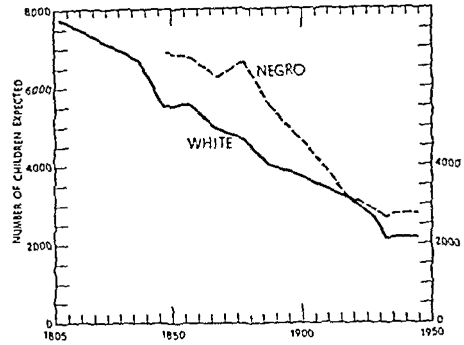

Chart 10.—Number of births expected per 1,000 women living through the childbearing ages at estimated birth rates for successive periods, 1810-1950. From the United States National Resources Committee.[2]

OVERPOPULATION

As the countries of Western society came under the influence of modern industrialization there was a long lag between the drop in the death rate and the subsequent decline in the birth rate; during this phase the population increased rapidly. This will doubtless occur also in the areas now entering industrialization; most of them are already densely overpopulated. Japan is an illustration. Her birth rate has begun to fall significantly; in fact her birth and death rates are similar to those of Britain and Wales a half century ago (Chart 11). Japan's population doubled itself between 1870 and 1920 and increased 31% between 1920 and 1940. A deceleration in the rate of growth became apparent in Japan around 1935, but the population may be expected to continue to increase

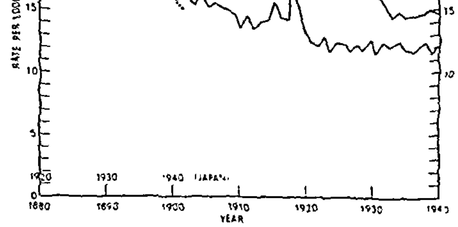

Chart 11.—Birth and death rates for Japan, 1921-1941 (represented by broad line) and for England and Wales, 1881-1939 (represented by narrow line), as found in Notestein,[1] p. 47.

for some time—this in a country already more heavily populated per acre of arable land than any other in the world.[9]

India, in the early phases of industrialization, already has a dense population, and it is increasing rapidly; in the decade from 1931 to 1940 the growth is estimated at 50 million, an increase in a 10-year period as large as the total population of Great Britain.[10] This increase may continue for an indefinite number of years as industrialization progresses, the death rate decreases, and the life span increases. Recently, Nehru has officially advocated birth control for India. The speed with which it can be introduced and adopted by the people is of vital importance.[10]

In other areas just entering the phase of early industrialization the situation is also critical. China's birth and death rates are very high; industrialization will surely decrease the death rate before it influences the birth rate; the population pressure, already intense, is certain to increase. Egypt, one of the most overpopulated and poverty-stricken countries, at present rates of growth, will probably double its population in the next 40 years.[11] Latin America, with a population now equal to that of the United States and Canada, will also double its population in the next 40 years.[11] Puerto Rico is already so crowded that its inhabitants have emigrated by the thousands to New York in the past decade; yet the population is increasing at a rate which is likely to double itself in approximately 30 years.[12]

The magnitude of the crises developing in these areas cannot be exaggerated. Man must learn to control his numbers, to correlate population with the supply of food and other conditions of well-being; if this is not done, the inevitable controls will be the "natural" limiting factors of population as described by Malthus: poverty, famine, disease and war.

Famine has been the scourge of Asia throughout recorded history. India and China are not able to feed themselves now. It may be alleged that they would be able to do so if adequate facilities for transportation were provided and modern methods of agriculture were introduced. The geographers and agriculturists who have studied this question are not in agreement.[13] Certainly more people could be fed than are now being fed, but there is no reason to hope that the increased production and distribution of food can keep pace with the present rate of increase in the population. It is estimated that two-thirds of mankind are chronically undernourished. Even if the population of the world were to remain stable, food would remain a principal concern of the majority of the human race for as many years as can be foreseen. But if present trends continue, as they will unless prompt world-wide action is taken, the population will not remain stable; it will increase rapidly; the bitter struggle for survival will become even more desperate.

In former ages, pestilence was a potent factor in the control of population. Modern medicine, sanitation, housing and technology have so changed the situation in Western society that deaths from epidemic diseases are becoming almost negligible. As these changes are introduced into the Orient, as dysentery, pneumonia, typhus and typhoid, cholera, malaria, and other scourges are brought under control, food will become an ever greater problem.

The influence of war on population has been variable. In earlier epochs, tribes were wiped out and nations submerged by conquering armies. The two World Wars, however, did not produce any serious depopulation; in fact, in all countries concerned, the birth rates rose and remained high for several years thereafter. In general, the effects of unusual economic and political situations, including wars and depressions, on total population growth are relatively transitory.

SUMMARY

In this paper I have endeavored to focus attention upon the relationships between population, the industrial revolution and modern medicine. The population problems of the world today can be divided into those of overpopulation in countries such as China and India, and those of a potentially declining population and aging in Western Europe and North America. The role of rational preventive medicine is clearly defined. In overpopulated areas, crises can be averted or ameliorated only through rationally planned conception. On the other hand, in those areas in which modern sanitation and medicine have resulted in lower death rates and greater longevity, the period of rapid population growth now seems to be nearing an end. Here, control of the degenerative diseases, of cancer, and of the social difficulties of old age are most prominent.[14]

The rational control of population depends on the attitudes of adults toward parenthood and on the availability of technical information; it is a personal and a social educational process. In it, the physician must bear his share of the responsibility of leadership.

Treatment of Narcotic Addicts.—The general practitioner should realize that it is almost impossible to treat addicts outside of institutions. Generally, addicts who present themselves to practitioners and request treatment are actually attempting to obtain supplies of drugs to maintain their addictions, and very frequently are obtaining drugs from a number of physicians. The general practitioner should therefore not attempt withdrawal of opiates or barbiturates in either the home or in general hospitals. The patient should be advised, and if possible persuaded, to enter some institution which specializes in treatment of addicts. . . .

The general practitioner can contribute most to the treatment of addiction after the patient has returned to his home following a period of institutional treatment. These individuals are in need of sympathetic understanding; they should not be regarded as criminals and every effort should be made to help them adjust to the various stresses of living without resorting to drugs.—Harris Isbell, M.D., What to Know About Drug Addiction, *GP*, Sept., 1951.

IMPORTANT CLINICAL DIVIDENDS FROM X-RAY EXAMINATION OF THE COLON

Fred J. Hodges, M.D.
and
Howard C. MacMillan, M.D., Ann Arbor, Mich.

A thorough, well-conducted radiologic examination of the large intestine represents a major diagnostic procedure in terms of technical and professional effort. If the considerable blocks of productive time which a radiologist must set aside for this one form of activity, as well as the time of technical assistants and the tying up of apparatus for considerable periods, are to be considered justifiable, it follows that the end-results of the procedure must constitute diagnostic assistance of great magnitude. From time to time it is necessary for the radiologist to reassure himself that the large expenditures of time and effort are truly worth while. A review of activities in the diagnostic division of the department of roentgenology at the University of Michigan for the five-year period July 1, 1944, to June 30, 1949, provides an opportunity to scrutinize in retrospect the clinical end-results of a considerable expenditure of effort in examinations of the colon. During that period over 200,000 patient-visits were made to the diagnostic division of the department, and of these, 7.2%, or 15,350, represented colon examinations. The proportion of this type of examination in relation to all other procedures varies less than one percentage point over the years.

With almost negligible fluctuation from year to year, 71.7% of all such examinations yielded findings considered to be entirely within the range of normal. It is fallacious to assume that this relatively high rate of normal findings represents unnecessary investigation and wasted effort. To be able to report with a high degree of accuracy that no serious abnormality exists represents a very considerable aid to the referring physician whose help and advice has been sought by patients presenting symptoms which suggest colonic disease. "Negative" findings which serve to narrow the field of possibilities in difficult and often obscure problems of differential diagnosis are truly valuable.

Six per cent of the total number of colon investigations represented repeat examinations in situations where diagnostic problems were particularly difficult. In 338 patients the presence of organic colonic disease was discovered although the exact nature could not be determined on the basis of x-ray findings. In this particularly difficult group the reexamination rate reached 42%, whereas in the preponderant normal group reexamination was utilized in only 3%.

ABNORMALITIES OF THE LARGE INTESTINE

Radiologically demonstrable abnormalities of the large intestine were found in 4,291 patients. The largest group within this category, 1,663 patients, presented one or more abnormalities among a large list of miscellaneous situations, no one of which occurred with sufficient frequency to be considered separately. Within this category of miscellaneous findings are to be found various postoperative alterations of the colon, fistulous tracts involving the large bowel at some point, megacolon, developmental anomaly, displacement by some unusual abdominal mass, hernia involving the colon, volvulus of colonic loops, and others. The ability to scrutinize segments of colon, permanently or temporarily abandoned by sidetracking operations, is frequently the source of highly important information for the surgeon in charge of the patient's welfare. By this means the subsidence of inflammatory lesions which earlier produced alarming obstructive symptoms can be detected. Decisions regarding the reestablishment of colonic continuity following temporary colostomy are often based largely on x-ray findings. The relationship of the large intestine to readily recognizable intra-abdominal masses of extra-alimentary nature is often helpful in the ultimate identification of such masses. This is particularly true in the case of primary tumors arising in retroperitoneal tissues. Occasional instances of endometriosis involving the colon come to light, explaining obscure lower intestinal tract bleeding or colonic obstruction. Unsuspected intraluminal foreign bodies can often lead to great diagnostic confusion until they are recognized on the occasion of x-ray examination. Hernias involving the diaphragm, anterior abdominal wall, or the inguinal canal may be shown to contain colonic loops. Herniation of the greater omentum almost invariably produces characteristic displacement and derangement of the colon, not infrequently providing totally unexpected clinical information for the diagnostician. The existence of megacolon, whether true Hirschsprung's disease or the expression of some obscure form of intestinal tract neuropathy, is easily verified by means of roentgenologic examination, and volvulus of the cecum, or more commonly the sigmoid, announces its presence in startling fashion. The same is true for intussusception.

Considered as a group, demonstrable miscellaneous abnormalities, involving the colon directly or indirectly, were encountered in the ratio of one to every six and one-half patients shown to be normal on radiologic investigation of the colon. Some of the abnormalities so grouped were of little clinical import although in some instances they were potentially significant in terms of future abdominal surgical procedures. Some of the miscellaneous findings, on the other hand, were of outstanding importance to the patient. The radiologist should

expect to derive much gratification from the factual information he is able to turn up in the category of miscellaneous abnormalities.

PATHOLOGICAL ENTITIES

Diverticulosis.—The largest single pathological entity to be encountered in the course of examinations by means of the barium sulfate enema is diverticulosis with or without associated inflammatory disease of the gut wall. One thousand four hundred seventy-seven patients, or one for every 7.2 individuals found to be normal, were shown to have demonstrable diverticula of the colon. The majority of these were localized to the middle and proximal portions of the sigmoid, although in several instances similar outpouchings were observed throughout the descending colon and even across the abdomen in the ascending limb. The presence of multiple diverticula is so commonplace in middle-aged and older patients that their importance tends to be minimized in the minds of radiologists, internists, and surgeons. The realization that they represent potential sources of perforation and subsequent peritonitis with abscess formation is offset by the universal experience that this complication occurs with relative infrequency. Nevertheless, associated inflammatory disease can and does occur, a fact which endows the discovery of diverticula with considerable importance because it encourages serious consideration of the possibility by the referring physician in the event of subsequent acute abdominal situations.

Colitis.—The presence of colitis, whether it be of unknown or specific etiology, can be determined with great accuracy by direct proctoscopic or sigmoidoscopic means if and when the process involves the lowermost segments of the large intestine. Fortunately this is often the case. Even when so discovered, it immediately becomes a matter of great interest to determine the full anatomical distribution of the disease. In certain types, particularly those of tuberculous or amebic origin, it is common to find the disease restricted to the cecum and the right colon, where it is totally inaccessible to direct external investigation. The response of nonspecific ulcerative colitis to treatment can be determined with considerable accuracy on the basis of repeated x-ray examination. The differentiation between primary neoplasm in the right colon and inflammatory lesions involving this same portion of the gut is often an extremely difficult problem without x-ray assistance. In the five-year period under discussion, conclusive evidence of ulcerative colitis, including all forms, was encountered in 238 patients, or in the proportion of one to every 45 patients found to have perfectly normal colons.

Primary Colonic Neoplasm.—Without doubt, the suspicion or fear of primary colonic neoplasm represents the commonest reason for requested examination by x-ray means. In this series, primary neoplasm of the large intestine was reported in the case of 575 patients, representing the finding of one such lesion for every 18½ patients in whom no colonic abnormality of any sort could be detected. The average of 115 patients per year in a patient population representing some 3,000 per year would seem at first glance to be a small return for so large a diagnostic effort in terms of this important lesion. As a matter of fact, however, the certainty of ultimate lethal outcome, in the absence of early apprehension and adequate surgical removal, endows the arduous search for primary colonic neoplasms with a sustained and deeply rooted earnestness. To a very considerable extent the degree of success with which x-ray examination of the colon is practiced can be gauged by the resultant yield of identified primary new growths.

During one year, July 1, 1947, to June 30, 1948, of the five-year period reviewed, the x-ray finding of primary neoplasm of the large intestine was reported in 131 persons. Twenty-nine of these persons were set aside from further detailed analysis for the following reasons:

Sought treatment elsewhere	9
Lesions ultimately shown to be inflammatory disease	7
Colonic lesion proved as extension from other organ	6
Polyps proved to be benign	5
Endometriosis	1
Error in cataloguing	1

The remaining 102 patients were in every instance verified as having primary malignant tumors involving some segment of the large bowel. All recorded clinical and laboratory findings were carefully reviewed, and symptomatology, details of treatment, and deaths which occurred within the year following the period of investigation were studied in detail. The average age of the group was 59.7 years, with male patients predominating (64%).

Symptoms: Of the initial symptoms recalled by the patients, change in bowel habit (48%), observed blood in stool (43%), and abdominal pain (20%) occurring singly or in combination were the most frequently recorded. The appearance of earliest symptoms prior to hospital admission averaged seven and one-half months with 68% of the group reporting over-all duration of six months or less. On the average, patients waited three months after observing initial symptoms before first consulting a physician.

At the time of admission to the hospital or clinic, visible blood in stools was the commonest single symptom of the underlying disease (75%), closely followed by weight loss of 5 lb. (2.7 kg.) pounds or more (65%), and abdominal pain (53%). Closely grouped thereafter came diarrhea (36%), anorexia (34%), and constipation (33%), to be followed by a lengthy list of specific symptoms occurring with low individual frequency. Ribbon stools were described in but 14%.

Physical Signs: The leading physical signs of the underlying neoplastic disease were the following:

Positive sigmoidoscopic findings	69%
Palpable mass on rectal examination	58%
Hemoglobin below 80%	46%
Demonstrable hemorrhoids	34%
Externally palpable abdominal mass	21%
Evidence of distant metastasis	15%

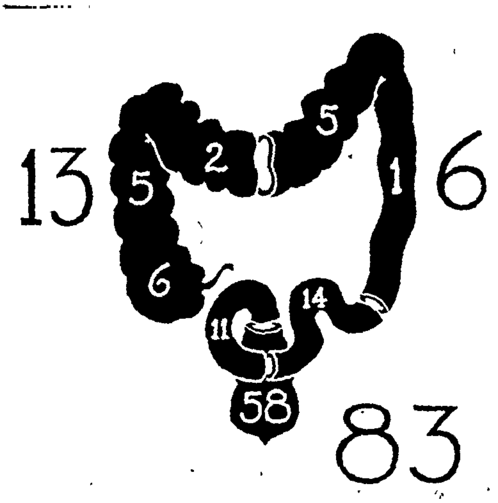
The most outstandingly effective methods of physical examination proved to be sigmoidoscopic examination, positive in 68.6% of the total group though employed in but 88 instances, and rectal examination, which successfully detected the lesion in 58% of the total group. Anemia, as expressed by hemoglobin determination below 80% of normal, was observed in 46% of the group. Hemorrhoids were detected in 34%, externally palpable mass in 21%, and evidence of distant metastasis in 15%.

With the exception of blood in the stool, the earliest symptoms associated with subsequently proved malignant colonic neoplasm are vague, and patients are wont to disregard them for considerable periods of time. The startling symptom of visible blood becomes a reliable index of the underlying disease in three-quarters of the patients before the tumor is ultimately apprehended. In over half of the patients abdominal pain suggests the wisdom of directed search for the presence of malignant neoplasm. Radiologists will be the first to agree that direct knowledge of the lesion obtainable by inspection and palpation is to be preferred over the indirect methods of roentgenology. It is easy for these same radiologists to overlook the fact that as many as 68.6% of a sizable group of patients with primary malignant colonic tumor can be accurately given a diagnosis on the basis of sigmoidoscopic examination without benefit of x-ray. The long-established wisdom of routine digital examination of the rectum is well substantiated by the fact that by this means 58% of all colonic malignancies can be directly apprehended.

X-Ray Diagnosis: Of the 102 patients under scrutiny, all of whom were shown by one method or another to have primary malignant lesions of the large intestine, and all of whom were subjected to searching x-ray examination of the colon, the lesion though present was missed on roentgen examination in one instance. On subsequent review of film evidence a short, annular deformity of the transverse colon very close to the splenic flexure was discernible though almost completely hidden by superimposition on the descending colon. This constitutes an inexcusable diagnostic error because examination should not have been considered complete and satisfactory until all segments of the gut lumen had been adequately scrutinized, and obviously this was not the case. The lesion was detected 85% of the time on the basis of initial routine fluoroscopic and standard film examination. In 14% of the patients reexamination by various specialized methods was needed to establish the diagnosis. The predominance of the rectum and the sigmoid as sites of malignant large bowel lesions was once more proved, with 56.8% in the rectum, and 24.5% in the sigmoid (a total of 81.3%). Dividing the sigmoid lesions into those which occurred in the proximal half and those which occurred in the distal half, the distribution was found to be 13.7% and 10.8%, respectively (figure). Granting that the x-ray method of approach cannot be considered essential in detecting rectal lesions or those which involve the lower reaches of the sigmoid, since digital examination and the use of the sigmoidoscope are here completely efficient, lesions which fall just beyond the reach of the sigmoidoscope, within the upper part of the sigmoid, occur in considerable numbers, and it remains for the radiologist to provide an accurate means of detection. Although the occurrence of primary malignant tumors above the junction of descending colon and sigmoid is far less frequent, diagnosis except in the case of very advanced lesions cannot be accomplished with acuracy by any other method in wide usage today. The radiologist is justified in taking full credit for the apprehension of the one-third of primary colonic neoplasms.

Air contrast technique was employed in 75% of this patient group, a much higher incidence than its over-all use in all patients subjected to colon examination. The reasons for this are obvious, of course. The detection or the suspicion of abnormality on fluoroscopy is logically followed with more elaborate filming methods than are required when screen examination is obviously normal. Another factor in the wide use of air contrast is the fact that many patients complain of rectal bleeding, which might mean the presence of polypoid lesions.

As observed roentgenologically, the tumors in this group ranged from 1 to 12 cm. in length, with an average of 5 cm. The extremes were recorded in very few instances. Seventy-five per cent of the lesions were described as annular in character, 23% were polypoid in appearance. Evidence of dilatation of gut lumen proximal to the lesion was recorded in 24% as compared with signs of retrograde obstruction to the introduction of barium in 40%, complete in 10%. On initial examination 5% of all patients showed incidental evidence of wide metastasis.



Location of 102 malignant colonic tumors.

Microscopic Examination: In all but 3% of the patient group the diagnosis was confirmed microscopically, with adenocarcinoma being reported in all but six individuals. On a scale of four, 63 of 73 patients were shown to have tumors of Grade 2 anaplasia or differentiation. In 90 patients from whom gross specimens were available, the tumor had penetrated all coats of the gut wall in two-thirds. In 74 patients from whom tissue was available, extension to lymph nodes occurred with an incidence of 60%; extensive involvement of many nodes was reported in 31%.

It is discouraging to learn that 60% of the entire patient group were known to be dead 24 months after the close of the period under study. On the other side of the ledger, survival of 40% from this unselected group of all proved large bowel neoplasms is better than might be expected from many another type of malignant tumor. The statistical records from this institution show that of 303 patients with carcinoma of the rectum and 170 with carcinoma of other segments of the colon, followed sufficiently long to determine five year survival, 24.4% of the former and 28.8% of the latter were alive at the end of five years after the discovery of the lesion. Here again the figures are raw, including all patients regardless of stage of advancement of the lesion.

The bulk of the patients in this group received no direct treatment of their tumors before admission to this institution. Two per cent had undergone segmental resection operations; 9% had been irradiated.

Therapy and Prognosis: Diagnosis having been established in this group of 102 patients, surgical removal was attempted in the case of 76, with 47 abdominal-peroneal, 25 segmental, and 4 local resections. Palliative treatment in the form of colostomy for the relief of obstruction was carried out in 14, while in 12 no treatment whatever was attempted. At operation peritoneal implants of the tumor and frank metastasis to other organs were observed in 28 patients, while direct invasion of neighboring structures was seen in 20, and the suspicion of lymph node involvement was recorded in an additional 13. Thus, in the case of 61 patients the lesions could be considered to have attained far-advanced stage at the time of surgical intervention. This means that, of 90 patients subjected to surgical procedures, successful handling could be expected only in 29.

In the light of subsequent developments the detection of a palpable mass on external abdominal examination is grounds for a gloomy prognosis. In this entire group of patients, a frankly or equivocally palpable mass was reported in physical examination in 21 instances. In these the lesion was found to have involved all coats of the gut in 17. At the end of two years following the study, 16 patients were known to be dead. Signs of invasion or metastasis to other organs were observed on operation in 13 and multiple node involvement was demonstrated in 9.

Location of Lesion: The patient's admission of "change in bowel habits" was found to be entirely unrelated to the anatomical location of the tumor, whereas ribbon stools reported by patients in 14 instances were related to lesions of the rectum and sigmoid in 13.

Of 70 tumors observed on sigmoidoscopic examination, 57 were located in the rectum, 9 in the lower half of the sigmoid, and 4 above midsigmoid. Tumors detectable on digital examination were within the rectum in 51, in the lower sigmoid in 7, and in a single remarkable instance above the midsigmoid. Profuse bleeding through the rectum was associated with sigmoid and rectal lesion in 67 of 70 patients. In 32 of 35 patients with ribbon stools the location of the tumor was in the rectum and sigmoid, while 9 out of 10 times when the symptom of alternating constipation and diarrhea was reported the disease was confined to the lowermost segments of the large intestine.

COMMENT

The important clinical dividends of x-ray examination of the large intestine are numerous, not the least of which are the reliable appearances of normalcy in patients who for one reason or another are suspected of harboring significant colonic disease. Approximately 25% of all patients subjected to x-ray examination of the colon may be expected to show some recognizable deviation from the allowable normal. Findings in this category cover a wide range of situations, the most numerous single entity being diverticulosis, commonly restricted to the upper reaches of the sigmoid. Although diverticulosis is usually considered to be a bland and a relatively insignificant deviation from normal, documentary proof of its existence is of value in outlining the care of the patient, and is of particular importance when it is associated with inflammatory disease of the neighboring gut wall. In matters of initial diagnosis, evaluation, and subsequent treatment, x-ray investigation is invaluable in the case of ulcerative colitis. Fortunately, the diseases properly grouped in this category occur with relative infrequence although the symptoms ordinarily associated with the situation are by no means uncommon.

Roentgenologic methods of examination play a very important part in the discovery, the localization, and the determination of individual characteristics and the extent of primary malignant tumors of the large intestine. In no wise to be considered a competitor of the more direct procedures of digital examination and sigmoidoscopic exploration, roentgenologic methods should be employed as an adjunct, even in the case of rectal tumors which are readily accessible from the exterior, in order that the status of the colon at higher levels may be determined prior to treatment. Above the midsigmoid level, where digital examination is no longer serviceable and where sigmoidioscopic approach has only limited value, it remains for x-ray methods to bear the main burden of detection and correct diagnosis. The more reliable symptoms and physical signs are to be found in those instances where direct examination through the rectum is most effective, and one reliable physical finding, externally palpable abdominal mass, is almost always an ominous indication of advancement of the disease to the hopeless stage.

A Great Physiologist.—Starling, teaming up with Bayliss, corroborated Pavlov's finding that the movements of the intestine were controlled by the autonomic nervous system. They then turned to the question of the secretion of juices by the pancreas. Were these secretions also controlled by nerves? Pavlov's work suggested that they were, and Bayliss and Starling set out to try to prove this hypothesis. But they made a completely unexpected discovery, in a historic experiment, which had shown, and Starling had instantly realized, that the body possessed a chemical means of communication—a blood-borne chemical signal which, like a nervous impulse, could trigger an organ into action. Starling and Bayliss soon identified this chemical and gave it the name secretin. They found that it came from the wall of the intestine. When acid from the stomach enters the intestine, it causes the wall to liberate secretin. The substance then travels in the blood stream and stimulates the pancreas to pour out the pancreatic juices that aid in the digestion of food. Secretin was not the first internal secretion to be discovered; physicians were already acquainted with adrenalin, thyroid extract and some of the other powerful substances produced by the glands. But Starling was the first to grasp the master role that these substances played in the communications and regulation of the body, and it was he who gave them the general name of hormones—a word suggested by one of his fellow workers.—Ralph Colp Jr., Ernest Starling, *Scientific American*, October, 1951.

POSTPHLEBITIC AND VARICOSE VENOUS STASIS

CLINICAL RESULTS OF TREATMENT BY PULSATILE AIR-PRESSURE PRINCIPLE

W. J. Merle Scott, M.D., Rochester, N. Y.

A disturbance in the return of venous blood and lymph from the subcutaneous region of the lower part of the legs is one of the commonest pathological conditions found in man. This expresses itself usually in one of two ways, namely, varicose veins or postphlebitic lymphedema. It is difficult to obtain precise figures for the incidence of these conditions, but any physician who treats adult patients knows the extreme frequency of their occurrence. In a survey of 1,000 young industrial employees, it was found that 10% had definite varicose veins. In an older group of department store employees, all over 40, the incidence had risen to 40% among the men and 70% among the women.[1] The corresponding figures for postphlebitic lymphedema cannot be cited, but this is an extremely prevalent condition.

VARICOSE VEINS

In the development of varicose veins the superficial veins enlarge because of the incompetence of their valves. Thus, in the erect position these veins support a column of blood from the heart to the lower part of the leg. The enlargement of the veins is relatively unimportant, but the increased orthostatic pressure and stasis in them slows the normal capillary circulation and greatly increases the pressure within the capillaries. As a result of these two factors capillary function is seriously interfered with. There is excessive loss of fluid from the blood stream to the extracellular spaces. The accumulation of protein-rich fluid and the impairment in the exchange of oxygen and metabolites lead eventually to local induration, pigmentation, and ultimately may result in the development of the typical stasis ulcer.

Varicose veins are always associated with a destruction or incompetence in their valves. However, there are two types of such valvular dysfunction. In the first type only the valves in the main stem veins of the saphenous systems are incompetent. The communicating veins (called perforators), which join the superficial and deep system of veins in the lower part of the leg, have valves which normally allow blood to flow only from the superficial to the deep veins. The valves in these perforators are competent in this first type of dysfunction. This is readily demonstrated by the Trendelenburg test. After emptying the veins by elevation of the extremity, they fill almost instantly on the patient's standing up. But with compression of the subcutaneous veins by a tourniquet applied lightly to the thigh, if the perforators are competent the refilling of the veins requires 30 seconds or more, as it does in the normal person. In cases of the second type of dysfunction, namely, incompetent perforating veins, the filling is rapid in spite of the compression of the superficial veins. In this case the perforating veins now allow the filling of the superficial veins from the deep veins. Such differentiation on the basis of the competence or incompetence of the perforating veins is of extreme clinical importance. In cases of the first type (competent perforators), the harmful effects of the venous stasis can be easily remedied by ligating the main superficial venous trunk (the great saphenous vein and in some cases also the lesser saphenous vein) above all branches. With competent perforators the blood in the superficial veins is drawn into the deep veins by the pumping action of alternate contraction and relaxation of the muscles in the lower part of the leg. In cases of the second type of dysfunction, however, in which there is gross incompetence of the valves of the perforating veins, the venous stasis is not permanently benefited by such ligation. The incompetent perforators no longer check the full hydrostatic pressure when the patient stands from being passed on to the superficial veins. Muscular action now only causes a to-and-fro motion of the blood through the perforators rather than a cyclical flow from the subcutaneous into the deep veins. The superficial veins have lost this most important method of moving the blood upward against the force of gravity.

POSTPHLEBITIC LYMPHEDEMA

In the acute stage of a case of femoroiliac thrombophlebitis, a clot forms in the femoral vein, but the inflammatory process also involves the deep veins in the lower part of the leg. In the severe cases, which result in a chronic postphlebitic lymphedema, the valves of the perforating veins of the lower part of the leg are injured by the inflammatory reaction. At first the symptoms are due to obstruction of the superficial or common femoral vein, the inflammatory reaction in the veins, and probably a reflex sympathetic vasoconstriction affecting the arterioles. After the subsidence of the acute symptoms, the venous obstruction is gradually overcome by the development of collateral venous channels and usually the canalization of the organized thrombus. Arterial vasoconstriction disappears, and the residual difficulty is primarily due to the destruction of the valves in the perforating vessels. The end stage in such severe cases is again then exactly the same as in cases of the second type of varicose veins, namely, an incompetence of the perforating veins resulting in a serious venous stasis in the superficial veins of the lower part of the leg. In addition, there may also be a partial obstruction to the lymphatic return due to involvement of the main trunk lymphatics in the inflammatory reaction surrounding the femoral vein at the time of the acute thrombophlebitis. Often the superficial veins do not show the obvious enlargement that is seen in cases of primary varicose veins. This

S.: Arteriosclerosis and Varicose Veins: Occupational Activities and Other Factors; Study of 536 Persons, Divided into Age Groups, Who Had Been Sitting, Standing, Walking or Climbing Stairs for 10 Years or More at Their Work, J. A. M. A. **119**: 696 (June 27) 1942.

is frequently due to fibrotic changes in the wall of the vein or in the surrounding subcutaneous tissue produced by the inflammatory process, the so-called "thick walled" varicose vein in contradistinction to the thin-walled type that develops without inflammatory reaction in spontaneous varicosities. The primary pathological physiology of the postphlebitic lymphedema is an orthostatic venous stasis sometimes combined with a partial obstruction to the lymphatic return. If the lymphedema continues unrelieved, subcutaneous induration, pigmentation, and ulceration are likely to follow in the course of time.

TREATMENT OF VENOUS STASIS

The problem in treatment is to overcome the harmful effect of the orthostatic venous hypertension and stasis and the associated lymphedema. Before treatment is started it is of paramount importance to determine whether these factors are due only to incompetence of the main stem veins or whether there is a major degree of incompetence of the perforating veins. If the incompetence is limited to the valves of the greater saphenous system proper and does not involve the perforators, then high ligation of the great saphenous vein near its junction with the femoral and above all of its branches will overcome the venous stasis and will prevent the resultant train of serious sequelae. If the varicosities have become sufficiently enlarged, the veins may not return to their normal caliber, and excision or sclerosing injections may be desirable for cosmetic reasons but are not necessary for overcoming the venous stasis. However, when a major degree of incompetence of the perforators exists, then such ligation will achieve little or no benefit to the underlying venous stasis. Although the orthostatic reflux of blood into the saphenous system through its main trunk is blocked, such filling occurs immediately through the enlarged and patent perforators, and the powerful pumping action of muscular contraction no longer is effective in emptying the superficial veins. In any severe case of postphlebitic lymphedema, it can be assumed that the perforators are grossly incompetent.

Many attempts in the past have been made to overcome venous stasis associated with incompetent perforators. These measures fall into three groups: (1) external compression, (2) sclerosing venous injections, and (3) ligation of the incompetent perforators together with high ligation of the saphenous trunk.

External Compression.—There have been many different forms of external compression—elastic bandages, elastic stockings, gum-rubber bandages, plain or elastic adhesive-tape strapping, and the Unna paste boot are the ones which have been most helpful. They all have one primary defect, namely, that the lower part of the leg is not spherical in its cross section (especially in its lower third) so that uniform compression cannot be obtained; also, the method of application is not uniform so that the same degree of pressure is not attained at all times. In order to obtain a more uniform pressure, some spongy material may be used under a tension bandage, the most popular one being sponge rubber. In this way a more nearly uniform pressure is obtained just above the ankle where stasis ulcers are most likely to occur.

Sclerosing Venous Injections.—Injection of the veins with a sclerosing solution will produce a clot which, if it completely occludes all incompetent perforating veins, will give temporary relief. There are three serious objections to this method however: First, the occlusion of the perforating veins is frequently incomplete. Second, even when occlusion is complete, canalization of the organized thrombi usually occurs. Third, the reaction to the thrombosis may still further injure the valves of perforators which were only partially incompetent. This method of sclerosing injections has enjoyed great popularity in the past on account of the temporary improvement that usually followed it. But on occount of the defects previously mentioned, it has today been largely discarded as the preferred method of treatment for venous stasis associated with incompetent perforators.

Ligation of Perforators.—There are varying degrees of incompetence of the perforating veins. When such incompetence is not too severe, ligation of the chief incompetent perforating veins together with high ligation of the great saphenous vein may give a good clinical result. However, when there is a major degree of incompetence of the perforators, such limited ligation of individual and large perforators is practically valueless for a permanent effect. Other incompetent perforators rapidly enlarge, and within a very few months the venous stasis is as severe as it was previously. From surgical experience this was gradually learned, and the surgeon became more and more radical in his attempt to divide incompetent perforating veins. Even stripping out the entire length of the great saphenous vein from the groin to the ankle does not permanently interrupt the incompetent perforators. The operation of quadrant dissection from the knee to the foot with the ligation of all visible perforating veins directly on or under the fascia is the ultimate in such a surgical attack. Such a major procedure is the only operation worth any consideration in the treatment of the severe forms of postphlebitic and varicose stasis when associated with major incompetence of the perforating veins. There are two objections to such a major procedure: First, such a widespread dissection in tissue whose lymphatics may harbor bacteria can result in rather serious wound infections. Second, even with this very extensive surgical dissection it is questionable whether all perforators, particularly those at the junction of the sole with the lateral margins of the foot, will be ligated.

In summary then, all previous methods of treatment have had serious defects, and many of the severe cases of venous stasis have not been checked by them. This point is well illustrated by the backlog of such cases that any large vascular clinic has—patients who have been returning regularly for many years with recurrent or continuing stasis ulcers, induration, stasis dermatitis, and repeated attacks of recurrent cellulitis.

When this problem was confronted in 1938 after the standard methods of compressive dressings, sclerosing injections, and a widespread dissection of the perforating veins had failed to prevent the recurrence of a postphlebitic stasis ulcer, it was decided to apply a regulated air pressure over the lower part of the leg. This was done by constructing a legging of an inelastic material containing an inflatable rubber bladder, which was pumped up after the legging was put on the leg. Then not only is there applied to the skin a controlled and uniform pressure throughout the extent of the rubber bladder, but also when the patient walks there is a rhythmical rise in the pressure with each contraction of the muscles. The legging is constructed according to this principle of pulsatile air pressure ("aero-pulse" principle). In essence, a substitute for the deep fascia has been placed outside the skin and subcutaneous tissues, and the powerful pumping action of muscular contraction compressing the veins and pushing the blood upward against gravity is applied by this means to the superficial veins throughout the lower part of the leg. After some experimentation as to the optimum pressure in the first very difficult case, this method of treatment resulted in the complete healing of the ulcer without interruption of the arduous use of the leg at any time. During the next 10 years in several other patients who had failed to respond to the standard methods of treatment the disease was also successfully controlled by this air-pressure method. The chief objection to the application of the method was the difficulty in having the legging made. In 1948 such a legging became available commercially,[2] and since that time my series of patients with venous and lymphatic stasis treated by this method has increased to over 350. The preliminary report on the results obtained in the first 50 cases was published in 1949.[3] The further experience with this method justifies drawing certain definite conclusions concerning its results.

RESULTS OBTAINED WITH TREATMENT BASED ON THE PULSATILE AIR-PRESSURE PRINCIPLE

Swelling.—The swelling due to postphlebitic or varicose stasis in the lower part of the leg can be adequately controlled. Acute inflammatory swelling, on the other hand, is not always controlled by the air pressure. Consequently, if there is a component of the swelling due to cellulitis or other infection, the infectious element may have to be controlled by the usual methods before the stasis lymphedema can be adequately overcome. However, if the infection is not too virulent, it has been found that it will frequently subside spontaneously while the patient is ambulatory after the legging has been applied. As a simple rule of thumb, it can be stated that any swelling which will go down overnight will almost surely be adequately controlled by use of the pulsatile air-pressure principle. This has been found to be true in my series of 220 cases of stasis lymphedema, whether the swelling was postphlebitic or due to varicosities with incompetent perforators.

Induration.—Induration of the skin and subcutaneous tissues is a characteristic feature of the latter stages of venous stasis in the lower part of the leg and is often accompanied by pigmentation of the skin. This induration is due to a chronic reaction in the tissues leading to a gradual formation of fibrous tissue and is often the seat of a chronic cellulitis or of recurrent acute inflammatory episodes. It is also frequently the precursor of an obstinate stasis ulcer. In many of the patients with postphlebitic lymphedema a rather marked degree of induration had already developed before treatment with the pulsatile air-pressure ("aero-pulse") legging had been initiated. The subcutaneous tissues were hardened and the skin thickened and corrugated. This condition does not respond quickly to treatment with the pulsatile air-pressure legging as the lymphedema does, but gradually there is a softening of the subcutaneous induration, the skin becomes smoother and more pliable and obviously in a better state of nutrition. Even the pigmentation of the skin may become lighter. The fully formed fibrous tissue probably never disappears, but the extent to which these chronically indurated areas could become softened after 6 to 12 months treatment with the pulsatile air-pressure legging has been a most agreeable surprise. In most patients with severe long-standing lymphedema some degree of induration has developed. Forty-three were chosen out of this series as showing an extensive degree of induration as a major characteristic. All of these patients showed a marked improvement in the extent and degree of induration.

Ulcers.—Postphlebitic and varicose ulcers in the lower part of the leg are regularly healed while the patient is ambulatory. The granulating base rapidly takes on a healthy red appearance, the surface infection of the ulcer is usually overcome without any additional treatment, the granulations fill the concavity of the ulcer, and the epithelium then rapidly grows across this flat surface. The only exceptions which I have found to this rule are the following:

Ulcer Base Unable to Support Epithelium: In many instances the ulcer base has appeared to be such thick scar tissue that it would never support epithelium. However, though the healing of such fibrotic ulcers may be slow, in only two instances have such stasis ulcers failed ultimately to heal. Ulcers that have been open for 5 to 15 years have finally healed firmly without excision of the ulcer base or grafting. In one case the ulcer base was directly on the tibia so that granulations could not develop. The edge of the ulcer started to grow nicely, but its center remained open because the base was formed by the periosteum. This ulcer was promptly healed and has stayed closed by the application of a split thickness graft and the use of the pulsatile air-pressure legging as soon as the patient was mobilized. This patient had been grafted twice before, with a successful result while she remained in bed but with rapid reulceration on mobilization. The last graft would undoubtedly have suffered the same fate if the element of venous stasis in the surrounding tissues had not been controlled by the legging.

Virulent Surface Infection: In about 5% of the cases of stasis there is a virulent surface infection which has to be brought under control before the ulcer will start healing. If the granulations do not promptly become healthy or in some cases if the granulating surface of the ulcer appears quite necrotic, appropriate treatment for the infection is started immediately. In many of these cases—whatever organism is isolated on culture—the infection will frequently respond to the use of bacitracin. Usually the infection can be controlled without the patient being off his feet, but occasionally before the ulcer will improve it is necessary for the patient to stay in bed to get the infection under control. A very virulent fungus infection is also a complication which has occasionally required active treatment before the use of the legging can be started. Usually, however, use of simple fungicidal methods are adequate while the patient is ambulatory and wears the legging. This point will be discussed more fully under the complication of dermatitis.

---

Local Complicating Factor Producing Inflammatory Edema: As previously stated, inflammatory edema may not be overcome adequately by the air-pressure effect. If there is an extensive cellulitis surrounding the ulcer, treatment of the inflammatory condition may be necessary before the venous stasis will be controlled locally and the ulcer will start to heal. Also, occasionally a localized thrombophlebitis in a vein beneath or near the ulcer may cause inflammatory swelling that will temporarily prevent the healing of the ulcer. In exceptional cases even after an ulcer has been healed for a long time by use of the pulsatile air-pressure legging, a small painful area may occur which then breaks down into a small open ulcer—in spite of the continued use of the legging and apparently without any mechanical failure. In two such instances a tender, thickened cord was felt under the area which disappeared within about three weeks, and the ulcer then healed again promptly. Apparently this was a localized phlebitis in one of the dilated veins in the region of the ulcer causing an inflammatory reaction that temporarily made the air pressure ineffective at that point. However, in only one such instance has such a local superficial phlebitis prevented the patient from continuing to be ambulatory. In four cases there has been a flare-up of a previous widespread cellulitis after the ulcers have healed, and the patients were apparently using the legging properly. In all of these cases the cellulitis had been severe and recurrent before the initiation of the treatment, with a marked induration of the surrounding subcutaneous tissues at the time treatment was started. Undoubtedly under these conditions bacteria are still present for many months in the scar tissue, and until they disappear they may cause a recurrence of the cellulitis even while the venous stasis is being properly controlled. This is one very important reason for controlling stasis lymphedema before the onset of recurrent attacks of cellulitis. All of these recurrent attacks during treatment occurred within a year after the use of pulsatile air-pressure legging was started. Apparently the likelihood of such recurrences of cellulitis is greatly reduced after adequate control of the venous stasis for several months.

Rubber Sensitivity: In a few instances after the legging has been applied and the immediate response has been good, there has developed, usually suddenly, a severe reaction of the skin around the ulcer, the skin becoming a deep-red color and the ulcer itself becoming inflamed. We have encountered three such cases, in each of which the skin was found to be extremely sensitive to rubber. After the reaction subsided, protective measures to insulate the rubber bladder from any indirect contact with the skin were initiated, and the ulcers healed promptly. Several other cases of milder rubber sensitivity have been found in which the skin directly under the rubber bladder became reddened and itched; this reaction also disappeared on the prevention of any indirect contact (through moisture) with the rubber of the bladder. My colleagues and I now inquire in all instances concerning rubber sensitivity and if necessary carry out a patch test of the patient's sensitivity to rubber. When there is only a mild sensitivity, it is usually sufficient to have the patient wear a woven-cotton bandage applied without stretch under the legging. When there is marked sensitivity, the bladder has been enclosed in a plastic envelope to completely insulate it from the skin.

Eczematoid Dermatitis: Dermatitis is a frequent complication of a stasis ulcer. When this takes an eczematoid form with extensive weeping, it may be impossible to apply the legging immediately. Although the dermatitis is kept up by the venous stasis and the legging effectively controls the latter, the slight increase in warmth under the legging and the decreased evaporation from the skin favors a flare-up of the eczematoid dermatitis. By the use of a woven-cotton bandage worn under the legging without stretch, merely to allow some evaporation and absorption of fluid, the patient with less severe eczematoid dermatitis can usually begin the use of the legging at once. Patients with severe eczematoid dermatitis require active treatment of the weeping phase before the legging can be tolerated. Bacterial or fungus infection must be combated actively by appropriate methods. A few of the patients with the severest form of eczematoid dermatitis require in addition a period of bed rest. This, however, is the exception. For patients with severer eczematoid dermatitis the leg is acclimated gradually to the use of the legging (it being worn for an hour at a time after which the skin is exposed to the air), and the various adjuncts to treatment are used. In only three cases, however, has the use of the legging been permanently discontinued on account of an intractable eczematoid dermatitis, and in these instances its use was discontinued by the patients after inadequate trial. Stasis dermatitis is frequently a very resistant complication of venous stasis, which frequently tries the patience of both the victim and the physician. This is occasionally true even when the venous stasis is controlled by the use of pulsatile air-pressure legging. However, if the weeping phase can be controlled, the stasis dermatitis, resistant to all forms of treatment while the stasis continued, can be cleared up.

Of 105 stasis ulcers in the lower part of the leg, 89 have been soundly healed by treatment with pulsatile air-pressure legging. With a large proportion of these ulcers this result had failed to be achieved by the standard methods of treatment, and many of them had not been firmly healed for at least three years. When a stasis ulcer fails to start healing promptly after application of pulsatile air-pressure legging, unless one of the above-mentioned factors is present to retard healing serious doubts should be entertained as to the accuracy of the diagnosis. Other causes of chronic ulcer of the lower part of the leg may be operative in the presence of varicosities. Certain specific infections (bacterial and mycotic), neoplastic infiltration of the skin, ulcers due to blood dyscrasias and to arteriosclerosis are among the commoner causes of lesions that might be mistaken for stasis ulcers.

PRECAUTIONS IN TREATMENT WITH PULSATILE AIR-PRESSURE LEGGING

Mechanical Faults.—The benefit from use of the legging depends on the air pressure exerted against the skin and subcutaneous tissues. The optimal amount of pressure has been learned empirically to be about 35 mm. of mercury in nearly all cases. Pressures considerably above or below this optimum will vitiate the beneficial result, and an excessive pressure may be actually harmful. There are two common faults whereby the proper pressure is not obtained: (1) incorrect fitting and (2) incorrect inflation of the legging.

Incorrect Fitting of Legging: The outer casing of the legging is inelastic. It necessarily has to be so in order to serve its function as an artificial external fascia. This casing must be large enough so that the rubber bladder when inflated will contain an air pocket at least ½ in. (1.3 cm.) wide throughout its length. If the legging is fitted too snugly so that such an air pocket is not obtained when the bladder is inflated, an excessive pressure may be present at some point. On the other hand, greater width of the inflated rubber bladder does no particular harm. It merely makes the leg appear unnecessarily large. In measuring for the legging one includes allowance for the space to be taken by any dressings, woven-cotton bandage, and so forth. The legging should be checked after its inflation to make sure that the air pocket is of sufficient breadth. For example, the casing should never press directly on the dressings over an ulcer.

Incorrect Inflation of Legging: The inflation of the legging to the optimum pressure is achieved by a pressure regulator on the inflator, which automatically gives the predetermined pressure. The mechanism is quite simple and can easily be operated by the patient. The patient should be checked as to his method of inflation to make sure that the proper pressure is being obtained. Over- or underinflation will prevent reliable results being obtained.

Topical Treatment of Ulcer.—Practically any local treatment desired can be applied in conjunction with the control of the venous stasis by use of the pulsatile air-pressure legging. Usually no special local treatment of the ulcer is necessary. If an ointment is used, the dressing should be covered by a square of some impervious material, such as cellophane, to prevent the grease of the ointment from working through the dressing to the rubber bladder.

An increase in watery discharge from the ulcer frequently occurs for a few days when the pulsatile air-pressure legging is first applied. This occasions no concern; in fact, it is probably beneficial in helping to clear up the surface infection. It is probably only a manifestation of the way in which the air pressure drives out the excess extracellular fluid in the tissues. The dressings should, however, be changed frequently enough so that they will be able to absorb all such fluid. After the first three or four days the surface usually appears cleaner, the granulations brighten up, and fluid exudation decreases.

Fungus Infection.—Some fungus infection is a frequent complication of a stasis ulcer or lymphedema. It may be observed as a patchy scaling of the skin that only occasionally flares up, or it may be a very obvious and extensive fungus dermatitis. On account of the prevalence at least of such fungus contamination of the skin, some simple measure of fungus control is usually instituted when pulsatile air-pressure legging is used. In my series of cases zincundecate (desenex®) powder was usually prescribed for such prophylactic fungus control. The treatment of a severe fungus dermatitis may tax the medical ingenuity of the physician. It should always be attacked vigorously until controlled.

Moisture.—Unabsorbed moisture should never be allowed to accumulate on the skin. This problem usually occurs in conjunction with an eczematoid dermatitis, either as the chief manifestation of the venous stasis or as a complication of a stasis ulcer or lymphedema. If the weeping is not too severe, the moisture may be absorbed by a woven-cotton bandage of the pressure (ace®) type applied without stretch under the legging. This bandage should be changed as frequently as necessary to keep the skin fairly dry. As in the case of ulcers, there may be a mechanical increase in the outpouring of fluid during the first few days. If, however, the patient can be helped over this initial period without an exacerbation of the dermatitis, the beneficial effect of overcoming the venous stasis may cause a gradual improvement in the dermatitis, with its eventual control as the gratifying result.

In the severer cases auxiliary methods should be employed, such as the use of dilute potassium permanganate soaks, methylrosaniline chloride (gentian violet) applications, fungicidal agents, and so forth. The skin may require acclimatization to the legging by alternating hourly periods of its use and exposure to the air.

While eczematoid dermatitis is the most frequent cause of trouble, with moisture accumulating under the legging, in some instances an excessive perspiration may cause a skin eruption. Use of absorption methods will usually control this difficulty. In excessively hot weather for a few patients periods of drying the leg in the air may be required. In general, the legging is usually well tolerated even in hot weather by most patients. There is much less difficulty with the legging from this than from the use of gum-rubber bandages, for example.

CONTINUANCE OF USE OF LEGGING

The pulsatile air-pressure legging is only a mechanical appliance which overcomes the venous stasis while it is in use. Usually the damage to the valves in the varicose veins or in the postphlebitic state is a permanent one. Therefore, the venous stasis will return on discontinuance of the use of the legging. Patients have to be energetically warned of this fact since the prompt healing of the ulcer and relief of all symptoms frequently induces in them a false sense of security, and they discontinue all treatment. For a time the improved condition of the skin may withstand the harmful effects of the untreated venous stasis, but if the incompetence of the valves is a major one, the serious sequelae of the uncompensated venous stasis are almost sure to return. After the ulcer has healed, the induration receded, and the nutrition of the skin has been improved, usually the patient can be allowed to go without the legging 10 to 25% of the time he is up and about on his feet. Of course, the legging can be taken off at any time when the patient is willing to keep his foot elevated to body level.

REPORT OF CASES

Case 1.—In a 46-year-old automobile mechanic, W. P., a thrombophlebitis developed in the left leg in 1947 after an injury. Since that time he has had postphlebitic lymphedema in the left leg, and a few months after the phlebitis occurred an ulcer of the lower part of the left leg developed, which has remained open since that time. Aching pain in the ulcer was a prominent and disabling feature. In January, 1951, the ulcer was approximately 7 by 5 cm. in its diameters and 0.5 cm. deep. Surrounding the ulcer was an area of stasis dermatitis with moderate induration. There were visible varicosities in the left leg with markedly incompetent perforators. The patient had used various types of compressive dressings and paste boots without avail. On Jan. 5, 1951, the pulsatile air-pressure legging was applied. Two weeks later the ulcer already showed marked improvement, with considerable filling in of the base with healthy granulations and good beginning growth of epithelium at the edge of the ulcer. Six weeks after this treatment was started the ulcer was painless and was approximately one-third its original size. The patient had returned to his regular occupation. The ulcer was completely healed in approximately three months, and the stasis dermatitis and induration surrounding it had disappeared; the lymphedema was adequately controlled.

Case 2.—W. B., a housewife, 73, had a severe attack of thrombophlebitis in the right leg 27 years ago, which was followed shortly afterwards by the occurrence of thrombophlebitis in the left leg. She had always had a lymphedema of the right leg since the occurrence of the thrombophlebitis, but the swelling of the left leg receded to reappear 10 years ago. Stasis ulcers of the right leg developed eight years ago. At first these would heal and break down again with the use of compression dressings. For the last four years the ulcers of the right leg have remained open, except for a period of 10 weeks when the patient was put at complete bed rest and the ulcers were healed. They promptly broke down again in spite of the use of compressive dressings, and they now are completely incapacitating the patient. The left leg went through a similar cycle, and the ulcers on this leg have remained open for the last two years. In March, 1950, the patient had four stasis ulcers on the lower part of the right leg and three on the left. Three of these ulcers were very deep, directly over the tibia, and apparently dead bone formed the base of the ulcer. Pulsatile air-pressure leggings were applied to both legs on March 17, 1950. In one month granulations appeared at the base of the ulcers except when this was on the bone, and the skin at the edge of the ulcers had already begun to grow. Two months after treatment the smaller ulcers had nearly healed; six months after treatment was started the ulcers of the left leg had completely healed, the smaller ulcers of the right leg had healed, but two larger ulcers had filled in with granulations through which small sequestra of bone made their way. One year after treatment was started all ulcers were healed except for two small crusted areas less than 0.5 cm. in diameter through which small spicules of dead bone still occasionally were extruded. After the remaining small fragments of dead bone are extruded, these ulcers will undoubtedly also heal.

Case 3.—D. M., a housewife, aged 30, was in the sixth month of her fourth pregnancy. Varicose veins developed during her first pregnancy and increased in size during each succeeding pregnancy. After delivery the distention of the varicose veins receded somewhat. An ulcer first appeared in the lower part of the right leg one month previously. It had become very painful and failed to heal in spite of the use of elastic compression dressing. Examination showed a pregnancy of about the sixth month and marked varicose veins in the lower part of both legs. On the inner aspect of the lower part of the right leg there was an open ulcer about 1 in. (2.5 cm.) in diameter, with a purulent base and surrounded by a large area of marked inflammatory reaction. A pulsatile air-pressure legging was applied on May 17, 1949. The inflammation and pain began to subside within three days, and the ulcer was completely healed within three weeks.

Case 4.—In F. R., a trained nurse, 71, bilateral thrombophlebitis developed in the left leg in 1946 after a fracture of the left patella. Shortly after the phlebitis occurred, an ulcer developed above the left external malleolus on the lower part of the left leg, which was treated by use of an Unna paste boot and healed. Six months later stasis dermatitis with an ulcer in the lower part of the right leg and swelling developed. An Unna paste boot was applied but had to be removed on account of pain. The patient then had a bilateral high saphenous vein ligation. After this, with the aid first of treatment with pressure bandages and then elastic stockings, the ulcer of the right leg healed completely by February, 1948, but recurred four months later. After sclerosing injection of the vein it healed slowly, and the patient returned to work in two months. In May, 1950, she had a recurrence of an inflamed, indurated tender area above the left internal malleolus, which was treated with use of a well-fitting elastic stocking. In spite of this, a painful ulcer developed in this region on the left. After sclerosing injection into the vein the ulcer appeared better for two weeks and then broke down again in spite of sponge-rubber pads, new pressure bandages, and so forth. On Oct. 17, 1950, pulsatile air-pressure legging was applied to the left leg, and within one week the ulcer had completely healed and the patient had returned to work. Two months later the skin over the ulcer area was of normal color, of good texture, and no longer painful and has remained so.

Case 5.—J. M., a retired police officer, 61, had had bilateral varicose veins for many years. Five years previously he had an injury to the left shin and ever since then has had recurrent ulcers in this area which would never heal solidly. He had a second accident to approximately the same area two and one-half years previously that was followed by persistent swelling of this leg. A large, painful ulcer had developed on the anterior aspect of the lower part of the left leg with an acute cellulitis in the region surrounding it. In spite of repeated sclerosing injections of the varicose veins and the use of elastic stockings and pressure bandages, it had been impossible to keep these ulcers healed, and the acute inflammatory reaction was incapacitating him. Examination showed one large ulcer and multiple smaller excoriations in the lower part of the left leg with a surrounding zone of induration and acute inflammation. Large varicose veins were present with grossly incompetent perforators and lymphedema of the of the lower part of the left leg. A diagnosis of stasis and postphlebitic ulcer with postphlebitic lymphedema and induration and varicose veins with incompetent perforators was made. A pulsatile air-pressure legging was applied on Sept. 30, 1949, which resulted in prompt relief of pain. Treatment was interrupted by a sensitivity reaction to rubber, but the ulcer had healed by Nov. 12, 1949, and the inflammatory reaction had entirely subsided. The ulcer has remained healed to date (21 months later), and the postphlebitic lymphedema and induration has been completely controlled.

Case 6.—B. B., a housewife, 59, had typhoid fever at the age of 21 complicated by a thrombophlebitis of the left leg. Ever since that time she has had swelling of the left leg, which increases during the day and goes down overnight. Most of the past 22 years she has had an ulcer on the lower part of the left leg. This has been treated with various forms of compression bandages and operations, including ligation and seven skin graftings. In spite of this treatment the ulcer has constantly recurred. The longest period in which it remained healed was one and one-half years. It has remained unhealed for the last five years. Examination revealed swelling of the lower part of the left leg and marked varicose veins with incompetent perforators. A painful ulcer with a dirty purulent base about 7.5 x 4 cm. was present on the inner surface of the lower part of the left leg just above the ankle. A diagnosis of postphlebitic ulcer and lymphedema was made. A pulsatile air-pressure legging was applied on July 22, 1949. Marked improvement with loss of pain occurred within three weeks, and the ulcer was completely healed for the first time in five years six weeks after this treatment was started. To date (22 months later) the ulcer has remained healed, and the induration in its base has subsided.

Case 7.—H. F., a commercial artist, 45, three years previously experienced a sudden occlusion of the right popliteal artery, probably from a thrombosis on an atheromatous plaque. Shortly after the arterial occlusion occurred, bilateral femoral thrombophlebitis developed. Since that time the patient has had marked intermittent claudication from the arterial occlusion and postphlebitic swelling in the lower part of both legs. In August, 1948, an indurated area just below the right ankle developed, which broke down into two open, indolent ulcers in February, 1949. These failed to heal with the use of compression bandages. There was no pulsation below the femoral artery of the right leg. A diagnosis of occlusion of the right femoral artery and postphlebitic ulcer of the lower part of the right leg was made. On July 22, 1949, pulsatile air-pressure legging was applied to the right leg. This effectively controlled the postphlebitic swelling and produced a healing of the open ulcers within three weeks. There was no appreciable effect on the intermittent claudication due to the impairment of arterial flow.

CONCLUSIONS

In cases of varicose veins the competence or gross incompetence of the perforators is of fundamental clinical importance. If the perforators are competent, high saphenous ligation will overcome the venous stasis. In cases of severe postphlebitic lymphedema it can be assumed that the perforators are grossly incompetent and that the orthostatic venous hypertension cannot be overcome by the pumping action of muscular contraction in the lower part of the leg. All previous methods of treating venous stasis with gross incompetence of the perforators have had serious defects. By the application of a regulated pulsatile air pressure to the lower part of the leg, the venous stasis can be overcome. Swelling due to postphlebitic lymphedema or to varicose venous stasis is adequately controlled by this method. Inflammatory swelling is not necessarily adequately controlled. The induration of the skin and subcutaneous tissues, so characteristic of the later stages of venous stasis in the lower part of the leg, gradually recedes. Uncomplicated postphlebitic and varicose ulcers in the lower part of the leg are regularly healed while the patient is ambulatory. Certain local complicating factors which may prevent rapid healing are outlined, and methods are cited for overcoming these conditions. Certain precautions which should be taken in order to obtain satisfactory results with this method of treatment are listed. Application of the pulsatile air-pressure ("aero-pulse") principle in the treatment of postphlebitic and varicose venous stasis has been successful in severe cases, when all previous standard methods have failed.

PROFOUND ACCIDENTAL HYPOTHERMIA

Harold Laufman, Ph.D., M.D., Chicago

My associates and I had the unusual opportunity of studying a patient who had been subjected to severe freezing conditions. We believe this case to be unique insofar as the degree of hypothermia was more profound than is ordinarily followed by recovery in the human or in most animals.[1] The critical level in humans is unknown, but it is commonly considered to be between 68 and 74 F.[2] Although some nonhibernating experimental animals have recovered from more profound hypothermia than did this patient, their periods of hypothermia were considerably shorter.[3]

CASE REPORT

At 8 a. m., Feb. 8, 1951, a Negro woman, 23, was brought into the admitting room of Michael Reese Hospital. She had been found by policemen about 15 minutes previously in a nearby alley in a frozen coma. The policemen assumed that she was dead because they were unable to detect any apparent respirations. The admitting intern and the admitting surgical resident observed a respiratory rate of 3 to 5 per minute. The apical pulse rate ranged from 12 to 20 per minute. The pulse was highly irregular, with periods of asystole up to 8 seconds. A vein was located in the antecubital area of the left arm and an ampul of caffeine and nikethamide (coramine®) was injected intravenously. The administration of human plasma was begun through this venipuncture. Oxygen was given by mask.

Physical Examination.—I saw the patient for the first time at 9:15 a. m., 75 minutes after admission. She was a moderately obese young Negro woman whose weight was judged to be 150 lb. (68 kg.) and height 5 ft. 4 in. (163 cm.). The patient was in deep coma. Respirations were 16 per minute. The apical pulse was highly irregular but strong, averaging 20 beats per minute with periods of asystole up to 6 seconds. Blood pressure by sphygmomanometer in each arm was zero.

Head: The head could not be moved from side to side except by exertion of considerable force. Furthermore, it was impossible to flex or extend the head. This was due to an extreme ridigity of the neck muscles.

Eyes: The lids were partially open, allowing a palpebral fissure of roughly ¼ in. (0.65 cm). Manual pressure on the eyeballs over the lids revealed an extreme degree of hardness, giving one the impression of pressing on glass. An area of opacity corresponding to the exposed bulbar conjunctiva covered most of the cornea, but the color of the iris could be seen. No blinking lid reflex was present. The pupils were fixed at a diameter of 3.5 mm. and did not react to strong light thrown suddenly into the eyes. A finger tip was placed directly on the cornea to test the corneal reflex. It was found to be absent.

Nose and Ears: The nose and ears were cool, but there was no evidence of frostbite. No abnormalities were present.

Mouth: It was impossible to open the jaws either manually or by attempting to insert bits of various kinds between the teeth.

Neck: The neck was very stiff, and the skin felt cool and could not be dented appreciably by the finger tip. There were no abnormal masses palpated.

Chest: The breasts were rubbery in consistency and no abnormal masses were palpable. Percussion of the heart borders revealed no abnormalities in shape or size. The apical beat was strong and highly irregular with pronounced bradycardia. The periods of asystole came at irregular intervals and varied in length from 2 to 6 seconds at this time. Auscultation revealed no discernible murmurs. The beats were loudest at the apex. Auscultation of the lungs revealed no rubs or rales.

Abdomen: The entire abdomen was firm and rubbery to palpation. Neither the liver nor the spleen could be palpated, because of the difficulty in denting the abdominal wall. Auscultation revealed a complete absence of peristaltic sounds.

Upper Extremities: No pulse could be palpated in the radial, brachial, or axillary arteries on either side. The skin temperature by palpation was progressively lower as one palpated from the shoulders to the hands. Touching the fingers or hands gave one the impression of touching ice. The elbows could be flexed only with great force. The hands and fingers were hard and could

not be dented. No attempts were made to manipulate the joints of the hands or fingers. Despite the patient's naturally dark skin color, there appeared patchy areas of dark violaceous lividity of most of the fingers and both hands to just above the wrists.

Lower Extremities: No pulse could be palpated in the femoral, popliteal, or dorsalis pedis arteries bilaterally. The garter area above the knees was still slightly indented from circular elastic garters, which had been removed. The skin of the thighs was rubbery and cool and could be dented on palpation. However, the skin of the area below the garter indentation was woody and could not be dented by the palpating finger. Touching these parts gave the impression of touching ice, or perhaps very cold metal. The skin from the knees to the tips of the toes was violaceous. The surface of this area appeared granular, the granularity being composed of what appeared to be desquamated epithelial cells. These areas were patchy and were more pronounced on the right side of each leg, that is, the lateral aspect of the right leg and the medial aspect of the left leg. Similar patchy areas of discoloration were found on the outer aspect of the right thigh and right buttock. The toes like the fingers were very hard and were not manipulated.

Back: Both buttocks exhibited areas of frostbite as described above; these areas were particularly pronounced on the right side.

Further Observations and Treatment.—At 9:30 a. m., 90 minutes after the patient's admission, a chemical thermometer calibrated according to centigrade scale was inserted into the patient's rectum for a distance of 5 in. (13 cm.). It was removed after three minutes and registered 18 C (64.4 F). The thermometer was reinserted so that readings could be taken at regular intervals (Fig. 1).

At this time 200 mg. of cortisone was injected intramuscularly into what appeared to be the warmest portion of the patient's body, the rectus abdominis muscle, just below the umbilicus.

A cut-down was made in the right antecubital fossa and the blood could not be drawn into a syringe readily since it was very thick in consistency. Consequently the blood was allowed to flow from the needle into test tubes for blood chemistry determinations. The flow of blood was encouraged by intermittent pressure on the upper arm. Some of the laboratory determinations, as shown in Tables 1 and 2, will be of interest since they were taken when the body temperature was 64.4 F. Of particular interest are the severe acidity of the blood and the extremely high serum glucose.

At 10:15 a. m. 2¼ hours after admission, the rectal temperature was 20 C (68 F). At this time a basal metabolism test was undertaken. The metabolic rate was —7.8%. The oxyge consumption graph shown in Figure 2 was taken an hour befor clinical evidence of respiratory embarrassment necessitated a emergency tracheotomy. An electrocardiogram was taken at thi time, when the rectal temperature was 20 C (68 F), and is show in Figure 3.

The patient was catheterized at 10:20 a. m.: 675 cc. of almo colorless urine was obtained from the bladder. The temperatu of the catheterized urine was 21.5 C (70 F). Results of u nalysis were as follows: pH 5; specific gravity 1.011; albumi 4+; sugar 2+; and no acetone. Microscopic examination of t centrifuged specimen showed 2 to 6 coarsely granular casts p high power field, 2 to 4 finely granular casts, occasional red bloc cells, 2 to 10 white blood cells, few squamous epithelial cells, o casional degenerated renal cells, and occasional bacter (Table 3).

By 11:30 a. m. the patient appeared to have difficulty in breat ing despite the oxygen mask. Further unsuccessful attempts we made to open the patient's jaws. A lubricated catheter insert into the nose could not be passed as far as the nasopharynx either side. Attempts to pass this tube caused slight bleeding fro the nose, probably due to erosion of nasal mucosa. The patie appeared to have obvious oxygen hunger, as evidenced now the gurgling sounds in the throat and the choking sounds th came with labored breathing. Consequently it was decided th an emergency tracheotomy should be done. The tracheoton was performed at 11:45 a. m., 3¾ hours after admission. Oxyg was administered through the tracheotomy tube, and the patie appeared to breathe much more easily.

At this time it appeared that the patient might recover. The fore, it was decided that the upper and lower extremities shou be dressed in pressure bandages, because of the possibility t massive edema might result later. At 12 noon, four hours admission, the legs and hands were gently washed with c pellets and dilute soft soap liniment, since they were covered gross dirt. Petrolatum gauze was applied, fluff gauze dre were placed over this layer, and elastic bandages complete pressure dressings. The temperature of the room was se pirically at 68 F, which was roughly equivalent to the pa internal temperature at this time. Except for the arms and which were bandaged, the body was exposed to the open

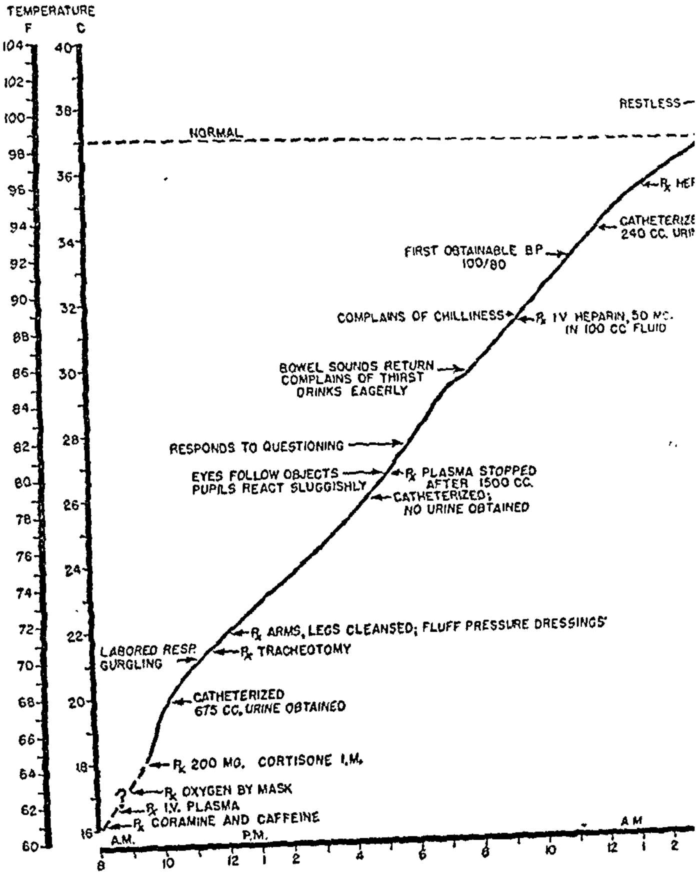

Fig. 1.—Temperature recovery curve from hypothermic levels.

The eyes were examined at 12 noon.[4] They were fixed in the primary position of gaze. The lids were essentially normal and the conjunctivas very pale, owing to constriction of blood vessels. Tactile tension was normal. The corneas were clear. The anterior chamber had normal depth. The pupils measured 2 by 2 mm., were vertically oval and did not react to light. The irises were brown, with no nodes or tumors. The lenses were clear. The vitreous was clear. The optic nerve heads were very pale and the capillaries severely constricted. The margin, size, and shape of the nerve heads were normal. The maculas were clear. The veins, which were full, were a deep burgundy. On slight pressure the veins emptied at the disk, but no definite pulsation was evident. The veins again filled at the disk when pressure was released. There was no arterial pulsation evident, and it could not be elicited by pressure; the arterioles were diffusely narrowed. There was a good light reflex; the retinas and choroid were slate gray. There was no evidence of hemorrhage or exudate. It was our impression that ischemia retinae was present.

‡ Rectal temperature 100-102 F. (extreme values).
§ Benzidine test.

By 3:30 p. m. the rectal temperature had risen to 25 C (77 F). The pulse rate was 72, with frequent dropped beats; respirations were 16 per minute. The administration of plasma was discontinued, 1,500 cc. having been given. The heart tones were of good quality, but the blood pressure was still unobtainable in the arms.

At 5:15 p. m. the rectal temperature had reached 27 C (80.6 F). The patient, although unable to speak, opened her eyes and followed objects and people; she appeared to be able to see. The pupils reacted sluggishly to light. There were no voluntary muscular movements in any part of the body. No peristaltic sounds could be heard on abdominal ausculation. The patient was again catheterized, but no urine was obtained.

At 5:40 p. m. the patient responded to loud questioning by shaking her head affirmatively or negatively. When she was asked about pain she responded in the negative. Muscular-

---

4. Examination by Drs. Theodore A. Shapiro and Irv

ments were now possible on a voluntary basis to a limited extent. The patient could bend her elbows but apparently could not move her legs. Another attempt at catheterization failed.

At 6 p. m., 10 hours after admission, the rectal temperature had reached 28.5 C (83 F) and a light blanket was placed over the patient's body. At this time she responded well to all questions. Ausculation of the abdomen revealed a return of peristalsis, although the sounds were somewhat hypoactive. The patient complained of being thirsty and asked for cold drinks. She took water eagerly. Within the next few minutes the patient complained of being cold and had a slight chill, which lasted a few minutes. More blankets were added to the covering. Although blood pressure was still unobtainable on the upper extremities, it was deemed advisable to move the patient from the emergency room to a ward bed. This was done with no apparent ill-effects to the patient.

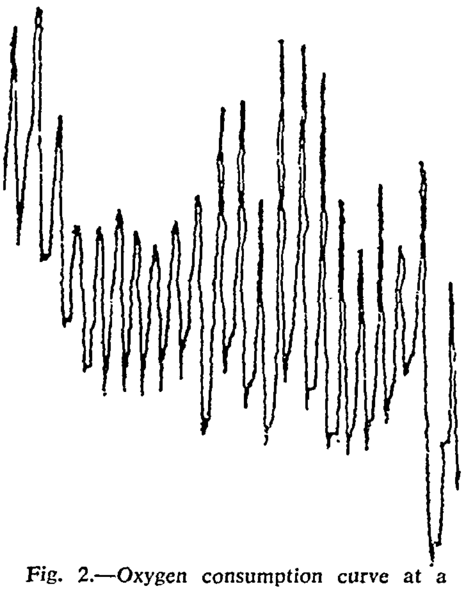

Fig. 2.—Oxygen consumption curve at a rectal temperature of 20 C (68 F).

At 8 p. m., 12 hours after admission, the patient's rectal temperature had reached 30 C (86 F), the apical pulse rate 120, and the respirations 16 to 18 per minute. Despite the tracheotomy tube, the patient was able to make sufficient sound to be understood when she spoke. At this time she asked for her father, who was called into the room; the patient immediately recognized him.

At 9 p. m. the rectal temperature was 31 C (87.8 F). The apical pulse rate was 100 and the respiratory rate 16 per minute. Bowel sounds were still hypoactive. Blood pressure was still unobtainable. Heparin administration by intravenous drip, 50 mg. every four hours in 100 cc. of 5% glucose and water, was begun. The patient requested and received sips of cold liquids. At 11:20 p. m., 15 hours and 20 minutes after admission, the first blood pressure was obtained; it was 100/80 on the left arm. Rectal temperature was 32 C (89.6 F). The patient asked to be moved to a more comfortable position, since apparently she could not yet control her muscular movements very well. At 11:40 p. m. the rectal temperature was 93.2 F; an ordinary rectal thermometer was used from this point on. Respirations were 22 per minute; the pulse rate was 100. The patient was catheterized, and 240 cc. of concentrated bronze-colored urine was obtained. Results of analysis of this specimen were as follows: pH 5, albumen 3+, sugar 1+; centrifuged sediment showed 10 to 15 casts per high power field, including mainly granular and occasionally red cell casts; tubular epithelium; occasional red blood cells and white blood cells; and no bacteria. The patient complained of a cold sensation in the hands and legs and shivered slightly.

At midnight the rectal temperature had risen to 95 F.

At 1 a. m., 17 hours after admission, the rectal temperature was 98 F, pulse rate 120, respirations 18, and blood pressure 118/80.

At 3 a. m., 19 hours after admission, the rectal temperature reached 101 F, pulse rate 120, respirations 18, and blood pressure 118/80. The patient complained of a fleeting chest pain, which disappeared spontaneously.

The rectal temperature remained at about 100 F for the next six hours. The patient began to get restless. At about 5 a. m. she complained of an uncomfortable feeling of warmth. The blankets were removed, and only a sheet remained to cover the patient.

A history obtained from the patient's father and husband indicated that she had been drinking more or less steadily for some nine hours prior to the time she lost consciousness. Apparently she had slipped on the ice at about 9 p. m. and, because of her inebriated condition, had had great difficulty in arising and lost consciousness. Therefore, it appears that her exposure had lasted 11 hours, from about 9 p. m. on February 8 to 8 a. m. on February 9. The patient had been dressed lightly; she wore a three-quarter length coat, sheer stockings, and light shoes; she had not worn gloves.

Conversations with the patient brought to our attention the fact that for the first 36 hours following return to normal temperature she had had amnesia for all events in the 12 hours immediately prior to her exposure until the time she regained consciousness. However, her memory for previous events was lucid and detailed. Thirty-six hours after the patient's temperature reached normal ranges she was able to recall the events that occurred within the 12-hour period prior to exposure. The amnesia for recent events following recovery from hypothermia has been observed previously.[5]

COMMENT ON HYPOTHERMIC PERIOD

Many questions arise concerning the reasons for this patient's recovery. There are many unanswered questions of physiologic significance. The accumulated data cannot answer all these questions, but it is hoped that these data will stimulate further experimental studies.

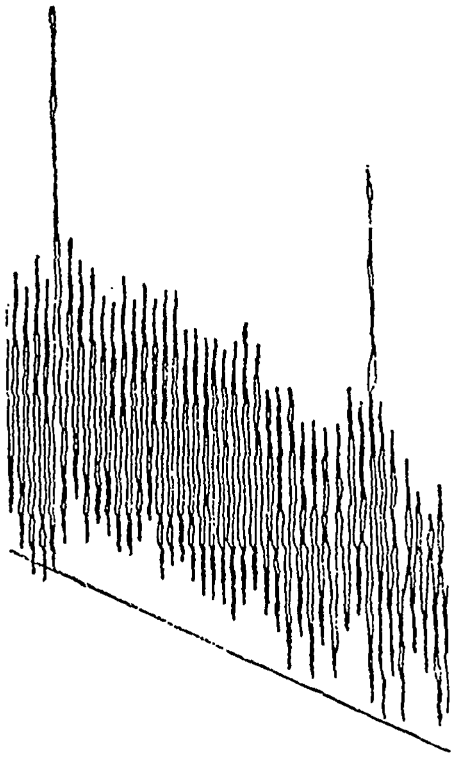

Fig. 3.—Normal oxygen consumption curve for this patient.

The recovery curve (Figure 1) followed a remarkably straight line in a room temperature of 68 F. The rise in deep rectal temperature during the recovery period averaged one degree per hour. No attempts were made to warm the patient. We had the choice of either the rapid [6] or slow [7] warming methods, each of which has its adherents. We chose to warm the patient slowly because of the extreme degree of hypothermia and the length of exposure. Under these circumstances we felt that rapid warming might cause a shift of body fluids from the intravascular to the extravascular space and possibly result in secondary shock. The only pronounced deviation in the recovery curve from a relatively straight line is the sharp rise immediately following the intramuscular injection of 200 mg. of cortisone. The significance of this deviation cannot be ascertained at this time, since the question arises as to the degree of absorption that would occur under such circumstances.

A projection of the straight line temperature curve to the time of admission would bring the rectal temperature on admission to about 16 C (60.8 F). To our knowledge recovery from such low temperatures has not been recorded in man.

The patient apparently had lain on her right side throughout the period of unconsciousness, since this was the side having the most marked areas of frostbite. The circular garter marks above the knee might have been a contributing factor to the extreme degree of frostbite below this area. It is well known that pressure is a contributory part of tissue destruction in frostbite.

Initial treatment of frostbitten extremities by the application of petrolatum gauze and fluff dressings with mild external elastic pressure is controversial. This type of treatment was used here since it is the therapy usually employed in burns at this hospital. Its rationale can be defended on the basis that the dressings protected the extremities against further trauma and against a secondary state of shock which might have followed extravasation of fluids into the tissues on warming. However, in the light of developments in the post-hypothermic period, the question might well be raised as to whether the saprophytic invasion of the tissues in the extremities, particularly by anaerobes, might not have been encouraged by occlusive dressings.

The question of vasodilating measures was considered rom the beginning. The most definitive work on this ubject in instances of severe frostbite indicates that vasodilating measures are probably contraindicated, since hey enhance local edema and might precipitate gangrene.[8] Other work has shown that this may not be true n milder cases.[9] In the light of this information, we used no local vasodilating measures in this case.

Anticoagulant therapy was begun as soon as peripheral blood pressure was perceptible, about 12 hours after admission. Experimental evidence indicates that anticoagulant therapy may prevent gangrene when the latter s due to thrombosis following frostbite, particularly when used very early.[10] There is also some circumstantial evidence that this may hold true in human cases.[11]

The rapid lowering of this patient's temperature in relatively dry cold surroundings might have contributed to her survival. The relative humidity according to the United States Weather Bureau ranged from 58% to 70% during the period of the patient's exposure, and the official temperatures for this period ranged from −1 F to −7 F. Unofficial temperatures in the neighborhood varied from −11 F to −15 F.

Regarding the effect of alcohol ingestion, we believe the alcohol could have served as an initial soporific comparable to the administration of barbiturates or light anesthesia to experimental animals to offset the intense psychomotor disturbances and panic of the first stages of abrupt chilling.[1a] Furthermore, alcohol is known to produce peripheral vascular dilatation at the expense of deep body temperature. Under such conditions a greater volume of blood would be exposed to the cooling effect of the surroundings and hasten a drop in body temperature. It is unlikely that ingested alcohol could work in any other manner. In Rascher's Nazi experiments,[2a] the ingestion of alcohol could not be evaluated since the amount given was very small and post-hypothermic observations were inadequate. It remains for controlled animal experimentation to clarify the effect of alcohol in this condition.

Metabolism.[12]—The metabolic rate of —7.8% which was obtained at a rectal temperature of 20 C (68 F) is not actually a basal reading, nor is it altogether accurate. This figure was calculated from the DuBois tables, as modified by Boothby and Sandiford, for normal body temperatures. Yet the actual metabolic rate extrapolated to the temperature of the patient would modify this figure only slightly. There are, however, several reasons why one would not expect a remarkably low metabolic rate in this patient: 1. The patient had ingested large amounts of alcohol prior to her exposure. Therefore, although all metabolic processes were diminished during the period of unconsciousness, there was nonetheless some absorption and metabolism of alcohol, albeit more slowly than under normal conditions. 2. Clinically imperceptible muscle fasciculation and fibrillation during hypothermia are known to prevent pronounced drops in metabolic rate.

The oxygen consumption curve taken at a rectal temperature of 20 C was compared with a later curve taken after recovery. Respirations at the time of the first test were about 12 per minute. The slow irregular rate and the irregularity in depth of respirations may be noted (Fig. 2), as contrasted with the normal pattern for this patient (Fig. 3).

Cortisone was given on the basis that this patient had undergone a severe degree of stress, with possible adrenal exhaustion. Proof of the value of either cortisone or corticotropin (ACTH) in hypothermia would depend on the results of controlled animal experiments. Evidence that there was a pronounced degree of adrenal stimulation induced by the stress condition of hypothermia is probably reflected in this patient's remarkable hyperglycemia (serum glucose 483 mg. per 100 cc.) in the frozen state. This situation is perhaps the result of both adrenal medullary and cortical stimulation. Glycogenolysis due to epinephrine may have been the initial cause of the hyperglycemia. Selye [13] has shown that exposure to cold superimposed on a period of fasting intensifies and accelerates the appearance of a secondary hyperglycemic peak after "fasting hyperglycemia." According to Selye, this rise in blood sugar appears to depend on the secretion of adrenocorticoids. As can be seen in Table 1, the serum glucose level fell to 121 mg. per 100 cc. within 24 hours after admission and to within the normal range by the following day, where it remained for the duration of the patient's hospital stay. Urinalysis showed no evidence of ketonuria either during the frozen state or thereafter. The severe acidosis during hypothermia (blood pH 7.17; carbon dioxide combining power 17.9 mM/L) is probably an expression of the reduced blood flow to the muscles with consequent accumulation of lactic acid.

[12] Metabolic observations were made in collaboration with Dr. Rachmiel Levine.

THE IMMEDIATE POST-HYPOTHERMIC PERIOD

The day following admission the patient was feeling rather comfortable, with no specific complaints. A complete inventory of the chemistry of the blood and urine was obtained (Tables 1 and 3). The only indication that difficult days lay ahead might have been seen from the urinary findings of albuminuria and the presence of coarsely granular casts. The pH of the blood during hypothermia had now approached normalcy and the hyperglycemia was definitely diminished, but there was present a 2+ cephalin-cholesterol flocculation with a slight derangement of the albumin-globulin ratio.

The therapeutic plan at this time involved three major objectives: (1) preservation, as far as possible, of frostbitten tissue; (2) prevention of infection; and (3) general care to reestablish a state of normalcy in body functions.

Frostbite Care.—The four-hour doses of 50 mg. of heparin were supplemented by an initial dose of 300 mg. of bishydroxycoumarin (dicumarol®) the day after admission. Heparin was discontinued within two days when therapeutic levels of prothrombin time were reached. After two days of bishydroxycoumarin we were able to obtain a supply of 2-phenylindanedione; anticoagulant therapy was maintained at therapeutic levels with this drug for 22 days. This drug was chosen because our experience with it in the laboratory [14] indicated that more even prothrombin levels can be maintained with it than with bishydroxycoumarin and that its effect disappears more rapidly after discontinuance.

The day following admission the patient complained, for the first and only time, of pain in the legs. We were unwilling to use opiates of any kind and decided to give the patient 500 cc. of a 0.2% procaine hydrochloride solution by slow intravenous infusion. Within five minutes after the start of the infusion the patient no longer complained of pain.

The morning following admission it was decided that the extremities should be rewrapped, since the dressings had been hurriedly applied in the emergency room the day before, when it was not known whether the patient would survive. The dressings were removed under sterile conditions in the presence of several surgeons. Inasmuch as the digits of both upper and lower extremities were frozen hard on admission, we took advantage of this opportunity to examine the functional state of these parts. We found that the patient was able to move the digits of all four extremities individually and collectively through a normal range of motion. Furthermore, some proprioceptive sense seemed to be present in each digit. Large blisters now covered the palms and dorsal surfaces of both hands, including the fingers, and were also present in a patchy pattern on both legs, the outer aspect of the right thigh, and the buttocks. The ankles and feet, though not actually blistered, appeared puffy and felt very cold to the touch. No pulsations could be felt in either dorsalis pedis artery, although they could be felt in the popliteal space bilaterally. Each extremity was carefully rewrapped, with petrolatum gauze, fluff dressings, and elastic bandage, in the position of function.

Measures to Prevent Infection.—On the day of admission penicillin therapy was instituted; the patient received 600,000 units daily thereafter for a period of three weeks. Subsequent antibiotic therapy is mentioned below. The day following admission prophylactic injections of 5,000 units of tetanus antitoxin as well as an ampul of polyvalent gas gangrene antitoxin (2,000 units of Clostridium welchii antitoxin and 2,000 units of Clostridium septicum antitoxin). Aseptic precautions were strictly observed in all dressings.

General Care.—We decided not to limit the patient's intake of food or fluid, since she appeared to enjoy and perhaps even need whatever she ingested. This plan may have played a role in later problems in fluid and electrolyte balance. The tracheotomy tube was removed 48 hours after admission, and the wound was closed with a Michel clip.

POST-HYPOTHERMIC SEQUELAE

Since the detailed account of the day-to-day course in the weeks following admission would be too lengthy for this report, the post-hypothermic sequelae will be summarized catagorically below. In some categories, progress to healing occurred in the absence of complications. In other instances the complications were so severe as to endanger the patient's life. These studies represent the cooperative efforts of a large number of hospital staff members, only a few of whom are mentioned below.

Ocular Findings.[15]—Eye examination the day after admission revealed that the pupils dilated well with eucatropine (euphthalmine®) hydrochloride 2% and hydroxyamphetamine (paredrine®) hydrobromide 1%. Vision was 12/20 on the right and 12/18 on the left. The patient could accommodate with either eye to 12 type at 14 in. The lids were normal and of good color, with no evidence of injury or infection. The conjunctivas were of good color, with no evidence of pathology. The preauricular nodes were not palpable. Tactile tension was normal. No pus or mucus could be expressed from the lacrimal sacs. The corneas were clear. There was no evidence of damage to the epithelium or endothelium. The anterior chambers were clear (no cells or transudation), with normal depth. The pupils were round and equal (2 by 2 mm.) and reacted to light, direct and consensual. The irises were deep brown, with no tumors or masses; vascular markings were clear, with good pigment ruff at the papillary border and no evidence of hippus. The lenses and vitreous were clear. External ocular muscle action was good; the levator palpebrae superioris was especially strong. There was good convergence power, within 125 mm. PcB. Duction and version movements were normal in the cardinal positions of gaze. There was no evidence of tropia. There was mild exophoria, of about 12 prism diopters. The right and left fundi were essentially the same. The disks were round and normal in size but showed mild temporal pallor; the nasal vein was pink, with sharp borders and normal excavation; there was no evidence of edema. The maculas were clear, with good foveal reflex and no disturbance of pigmentary epithelium. The arteriovenous ratio of the retinal vessels was 1:1.5; there was a good arteriolar reflex, with no evidence of sheathing or arteriovenous compression, undue tortuosity, or exudates or hemorrhages. A spontaneous venous pulsation was noted at the disk. There appeared to be little evidence of ocular pathology. The ischemia retinae noted the previous day had completely cleared. The retina and optic nerve revealed no permanent damage at this time. The vision was excellent. Subsequent eye examinations revealed no residual pathology.

[15] Drs. Theodore A. Shapira and Irving S. Krause.

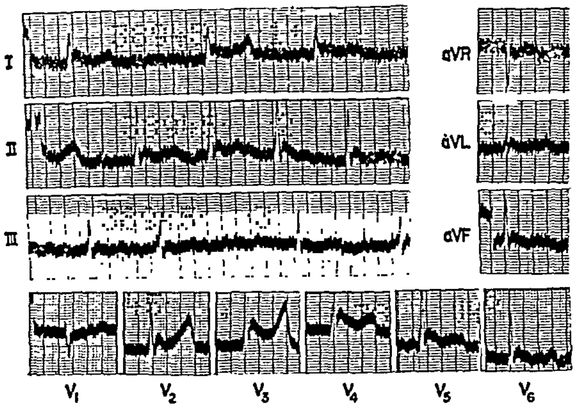

Fig. 4.—Electrocardiographic tracing taken at rectal temperature of 20 C (68 F). The tracing is distorted by extracardiac artifacts due to muscle tremor. No P waves can be distinguished. The ventricular action is irregular at an average rate of 42 per minute. The longest R-R intervals are equal, corresponding to a rate of 30, and intervals of less duration, separating the longest intervals, show progressive shortening. Auricular fibrillation cannot be excluded. However, the spacing of the ventricular complexes suggests the presence of nodal rhythm with second degree auriculoventricular block and Wenckebach periods below its point of origin. Under this assumption depression of the primary pacemaker (complete sinus standstill) or complete sinoauricular block could be the primary disturbance of rhythm. The S-T-T complexes show marked prolongation and bizarre configuration. The Q-T interval of the longer cycles measures 0.78 sec. instead of the expected 0.48 ± 0.04 sec. S-T is elevated in most of the leads and forms a broad concavity between two peaks, thus giving the impression of a double T wave. (Interpretation by Drs. A. Pick and L. N. Katz.)

Electrocardiographic Data.[16]—With the return to normal ranges of temperature there appeared a sinus tachycardia, which persisted until 12 days after admission. Electrocardiograms were taken daily from the time of entry. A detailed study of these is being reported separately. An electrocardiogram taken six days after admission (Fig. 5*A*) showed a configuration commensurate with a pattern seen in acute diffuse pericarditis. By February 21, thirteen days after admission, the pulse rate returned to within normal limits and the electrocardiogram showed evidence of restitution (Fig. 5*B*).

A summary of the essential electrocardiographic changes in this case can be divided into three stages: 1. The earliest period extended over three days, with maximal changes on the first day of observation. This period was characterized by (*a*) disturbances of cardiac rhythm due to depression of activity of cardiac pacemakers and probably partial depression of sinoauricular and atrioventricular conduction. These changes showed more rapid regression (within one day) than (*b*) the severely over-all alteration of the repolarization process of the ventricular myocardium, extending over three days and producing unusual changes of duration and contour of S-T-T. 2. A period of progressive T wave changes, imitating in type and duration (about two weeks) the electrocardiographic course of acute diffuse pericarditis. This would suggest that during this period organic and/or functional alterations present in the myocardium were restricted mainly to its outer, subepicardial layer. 3. A stage of restitution, which in the course of further observation showed decided lability as evidenced by episodes of partial relapse to previous electrocardiographic abnormalities with rapid restitution.

Respiratory Tract.—At no time throughout the entire period of hospitalization was there any evidence of lung pathology.

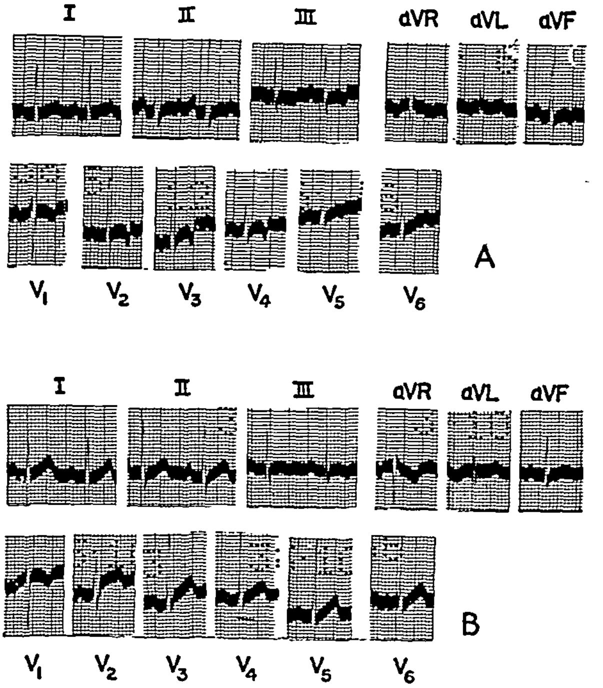

Fig. 5.—*A*, electrocardiographic tracing taken Feb. 14, 1951, six days after admission. Rate 115; P-R interval 0.18 sec.; sinus tachycardia. S-T is no longer deviated, and Q-T is of normal duration. The configuration of the T waves is similar to a pattern seen in the course of acute diffuse pericarditis. *B*, electrocardiographic tracing taken Feb. 21, 1951, 13 days after admission. Rate 88; P-R interval 0.18 sec.; restitution to normal.

Hematologic Findings.[17]—Figure 6 and Table 2 show the parallel course followed in the post-hypothermic period by the hematocrit, the hemoglobin, and the red blood cell levels. This could have been due to a post-

---

16. Drs. Alfred Pick and Louis N. Katz.
17. Work done in collaboration with Dr. Karl Singer.

hypothermic anemia or to hemodilution. A transfusion of 500 cc. of blood was given on February 20 (12 days after admission) without full knowledge of what the drop in the red blood cell count actually signified. The transfusion had no observable effect on the downward course of the red blood cell count. Unfortunately blood volume studies were not made at this time. However, evidence that the drop in hematocrit, hemoglobin, and red blood cell levels was probably not the result of anemia was obtained from blood marrow studies on February 17 (nine days after admission). The marrow examination showed no evidence of increased erythrocytogenesis. The complete marrow report was as follows: full marrow; megakaryocytes adequate; erythroblast-granulocyte ratio 1:4; red cell series normoblastic; no foreign cells or parasites. The marrow was considered essentially normal.

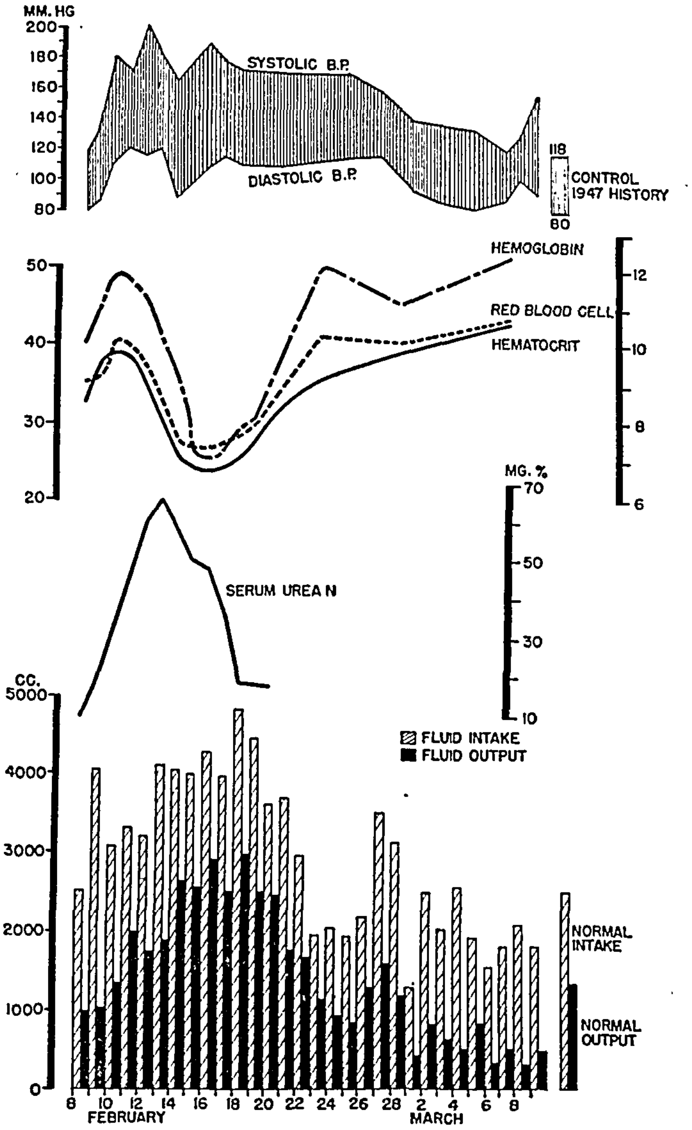

Fig. 6.—Correlation of blood pressure, blood picture, serum urea nitrogen, and fluid intake and output in the post-hypothermic period.

No eosinophils were found in the blood smears on the day of admission. The significance of the lack of eosinophils in the hypothermic period can probably be ascribed to adrenal stress.[18] The next day two eosinophils per 100 leukocytes were found. This count persisted until March 5, when again no eosinophils could be found. On this date the patient exhibited a skin rash. The rash disappeared when all antibiotics were stopped. After March 12 four eosinophils per 100 white cells appeared; this count persisted fairly consistently throughout the entire hospital stay.

The cold agglutinin titer on February 19 was 1:1, not a significant titer. Results of a saline erythrocyte fragility test, on February 20, when the anemia was severe, were within normal range.

Electroencephalographic Data.[19]—Unfortunately it was impossible to get an electroencephalographic tracing while the patient was in coma. The first tracing was made on February 13, five days after admission. The base line showed low voltage waves of 4.5 cps throughout. A moderately well-sustained 10 to 11 cps rhythm was found occipitally and to a lesser degree centrally when the slower rhythms were in abeyance. Except for slow waves, the diagnostic impression was that there were no gross abnormalities.

The test was repeated on June 21, some 18 weeks after admission, at which time the record was not notably different from that of February 13, and was classified as within normal limits. It can be surmised that the hypothermic period resulted in no permanent change in the electroencephalographic record.

Changes in Blood Pressure, Water Balance, Electrolyte Balance, and Renal Function.[20]—The blood pressure became perceptible 14 hours after admission, when the rectal temperature was 33 C (91.4 F). The blood pressure then was 100/86. Blood pressures in the range of the patient's norm of 118/80 (available from a previous record) persisted for only 36 hours, when hypertension gradually became evident. As can be seen from Figure 5, the blood pressure reached definite hypertensive levels two days after admission and remained high for a period of 18 days. During this period blood pressure ranged from 170/100 to 200/120 with few exceptions. A detailed description of the data accompanying this hypertension forms the basis for a separate report, but a summary of the available data will be made here.

The fluid intake of this patient was governed largely by her desires, since we were unaware of any possible ill-effects that this might entail. We were concerned mainly with the question of urinary excretion. Beginning the fourth day the patient began to excrete abnormally large amounts of urine. In Figure 6 it can be seen that the excessive fluid output from the third to the 13th day, paralleled the excessive daily fluid intake for this period. Yet the urinary specific gravity at no time within the first seven days fell below 1.009 or went above 1.012. Following this period (after the 13th day) the daily urinary output was relatively low and the intake varied from low to moderately excessive. The specific gravity rose to 1.022 by February 28, at a time when the urinary output was markedly diminished.

The only intravenous supplementation of intake throughout the charted period consisted of 1,500 cc. of plasma and 1,000 cc. of 5% glucose in saline intravenously on the day of admission, 500 cc. of saline containing 0.2% procaine hydrochloride the next day, 500 cc. of blood on February 20, 12 days after admission, and 1,000 cc. of 5% glucose in saline on February 21, 13 days after admission.

[18] Dalton, A. J.; Masson, G., and Selye, H.: Coagulation et éléments figurés du sang pendant le syndrome général d'adaptation chez des animaux normaux et chez des animaux adrénalectomisés, Bull. et mém. Soc. roumaine endocrinol. 5: 176, 1939.

[19] Drs. Herman M. Serota and M. Torman.

[20] Work done in collaboration with Drs. William I. Freud, Richard Sternheimer, and I. I. Ritter.

Figure 6 demonstrates the correlation between excessive fluid intake and hemodilution, as evidenced by the parallel drop in hemotocrit readings, hemoglobin, and erythrocyte counts. The assumption that a hypervolemic state existed was supported by the bone marrow evidence against anemia, although blood volume studies were not performed.

During this same period there was a marked degree of azotemia, with a peak serum urea nitrogen of 66 mg. per 100 cc. on February 13, five days after admission. Serum creatinine levels increased proportionately, reaching a peak of 6 mg. per 100 cc. one day before the maximum elevation of urea nitrogen. Urinary creatinine measured in grams per 24 hours was extremely low during most of the period in which the serum creatinine was elevated, indicating a defect in creatinine clearance. Also, throughout the two-week period following injury albuminuria (2+ to 4+) was present and lipoid casts were found in the centrifuged sediment.

From this data it would appear that, in addition to the apparent hypervolemia associated with hypertension, kidney damage was also present. Lewis and Thompson[21] found "acute nephrosis" in rabbits exposed to local cold injury. The urine of their animals exhibited lipoid casts and degenerated renal cells similar to those found in this patient.

The other chemistry determinations during this period indicated that there was a relatively normal serum sodium, but an extremely low output of sodium in the urine (Fig. 7). The serum chloride levels more or less paralleled those of the sodium except for a short period in which there was mild hypochloremia. Salt intake, although unmeasured, was considered normal. Because of the apparent hemodilution, the normal serum sodium levels could actually represent relative hypernatremia. On the other hand, the extremely low urinary sodium and chloride levels expressed in milliequivalents per 24 hours represented an absolute diminution in excreted sodium and chlorides, again suggesting sodium retention. This picture might be consistent with the disturbance in renal function produced by Selye[22] in animals treated with desoxycorticosterone acetate. The sodium retention in our case might have been due to renal damage. However, it is more probable that it was due to adrenal hyperactivity, especially in view of the fact that potassium excretion was abnormally high for a prolonged period at a time when pronounced nitrogen retention occurred.

During the period under discussion there was moderate hyperphosphatemia and a diminution in urinary phosphates. Both of these deviations were corrected as the blood pressure approached normal limits and the azotemia disappeared. Urinary creatine was significantly elevated from the period three days after admission for eight days.

It is impossible to state whether there was any relationship between the effects of tissue destruction and the persistence of hypertension. However, there seems to be an apparent correlation between the two, inasmuch as the final recession to the patient's norm of 118/80 did not occur until five days after amputation of the legs.

The available data suggests that we were dealing with a combination of events. There seemed little doubt that kidney damage was present, involving both tubular and glomerular elements. The voluntary demand for excess fluids by the patient might have been due to the resulting isosthenuria, leading in turn to hypervolemia.

Frostbite Sequelae.—Despite massive dressings and intensive antibiotic therapy as previously outlined, it became necessary to change the dressings on all four extremities every 48 hours after the fourth day because of permeation of large amounts of malodorous drainage. Débridement of epidermal layers was carried out as indicated on a conservative basis. Large blisters were not opened. When such blisters ruptured spontaneously the necrotic overlay was removed.

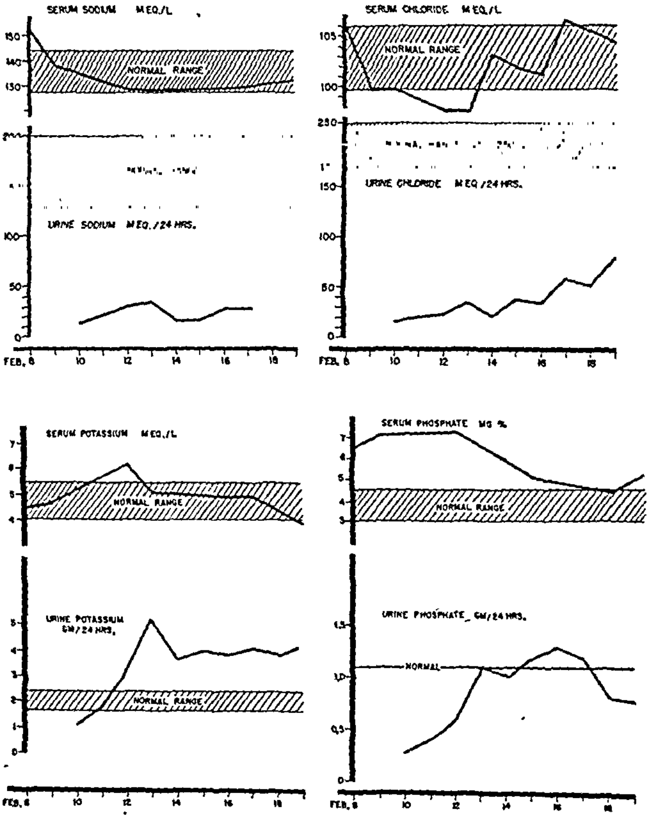

Fig. 7.—Serum and urinary sodium, chloride, potassium, and phosphate levels in the post-hypothermic period.

Although it was evident after five days that there was no sign of viability in the tissues of either foot, the patient was still able to dorsiflex both feet and move the toes, but this latter movement was not through as wide a range of motion as previously. There was no sensation in either foot or leg up to just below the knee level. On the seventh day the hands, as well as the fingers, were covered with huge blisters on both the dorsal and volar surfaces, but the patient had an almost full range of motion in all joints of all fingers. She was also able to abduct and adduct all fingers and to oppose the thumbs. This indicated viability in the intrinsic muscles of the hands. The larger blebs were aspirated of clear straw-colored fluid, the volume of which was estimated to be 300 cc. from both hands.

---

[21] Lewis, R. B., and Thompson, R. M.: Acute Nephrosis Following Experimental Local Cold Injury, United States Air Force School of Aviation Medicine, Progress Report No. 21-23-016, November, 1950.

[22] Selye, H.; Hall, O., and Rowley, E. M.: Experimental Nephrosclerosis: Prevention with Ammonium Chloride, Lancet 1:301, 1945. Selye, F. L.: Biochemical Changes in Hypertension, Canad. M. A. J. 57:325, 1947.

On February 16 (eight days after admission) a coat of necrotic epidermis was removed over the palm and the dorsum of both hands and wrists. The underlying tissue proximal to the metacarpophalangeal joints appeared pink and smooth, while distally this layer was dark red and partially demarcated from the pink tissues proximally. At no time was there pain associated with redressing or with active motion of the fingers (Fig. 8).

After two days the blisters on the buttocks were exposed to air under a bed cradle, since it was difficult to keep them dressed. They were treated with boric acid dressings periodically throughout each day.

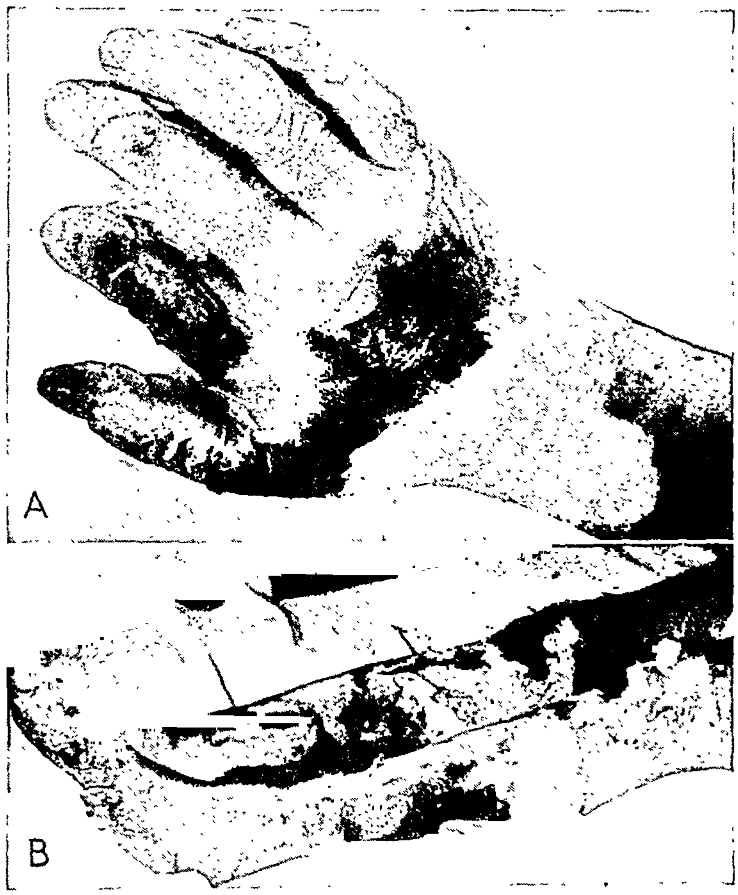

Fig. 8.—Appearance of hands and legs on Feb. 16, 1951, eight days after admission. At this stage there was still motion in fingers and toes.

Dressings of the lower extremities on February 21 (13 days after admission) revealed that with the exception of large areas on the right side of each leg, in which the superficial tissue now appeared black and nonpliable, most of the surface of the legs was covered by what appeared to be pink epithelium. The skin of the toes was still adherent. The lesions of the leg appeared delimited from the milder blisters of the thigh by the garter line in the superpatellar region.

There was evidence now of foot drop, and the patient was no longer able to dorsiflex the ankles. Dressings of the hands the same day revealed the beginning formation of a dark brown firm eschar over the fingers.

A dark eschar developed over the legs and feet over the next few days. Aquaphor® (ointment containing hydroxyl animal fats) dressings and saline soaks were used on the hands in an attempt to soften the eschars. This apparently proved to no avail and was discontinued after four days. The eschars on each finger were bivalved on February 25. The right hand was placed in an aluminum cock-up splint between soakings, since a moderate wrist drop appeared to be developing.

Dressings were done daily from this point on, and débridement was carried on in which small amounts of the eschar were taken away from the proximal edges as far as spontaneous separation would allow. We were encouraged by the fact that as the eschar was cut away from both the hands and the legs, pink granulation tissue was invariably found underneath.

On March 4 examination of the legs revealed that, while some areas in the upper third were epithelized, about 60% of the exposed surface of the legs between the eschar and the knees had lost a full thickness of skin. The eschar at this time had been débrided to about the level of the lower third of the tibia. Directly over the lower aspect of the tibialis anterior muscle the granulation tissue did not appear as healthy as did the higher areas. Deeper débridement at this time, through the fascia and into the belly of the tibialis anterior muscle, revealed the muscle to be salmon pink, foul smelling and noncontractile on cutting. Nonetheless, bleeding was brisk from spurting small arteries which were cut across when the muscle was incised. There was no pain at any time during this débridement without anesthesia. The bacon rind eschar from this point distally was not removed but was bivalved to a deeper level. A deliberate incision was made over the dorsum of the left foot, revealing black, foul-smelling necrotic tissue to the bone. It became obvious to us at this time, that, despite all measures to preserve tissue, it was necessary to amputate both lower limbs at least as high as the lower third of the tibia. Surgery was postponed because of a severe generalized skin rash, presumably caused by penicillin. Maximum temperature elevation during this period was in the neighborhood of 100 F. The pulse rate during this period ranged from 120 to 130, and the patient appeared toxic. Terramycin, 2,000 mg. per day, was given in place of penicillin. Within 48 hours the stools became tarry and were strongly positive for blood. Anticoagulant therapy was stopped on March 6, 26 days after admission, as was all medication, including terramycin. Vitamin K was administered.

On March 8, with the use of cyclopropane and eth anesthesia, the amputations were performed. Guilloti amputations were performed at the lowest possible lev commensurate with viable tissue. This was approx mately 9 in. (23 cm.) below the knee bilaterally. Th patient took anesthesia very poorly and had a pulse ra between 120 and 160 throughout surgery. After the fir leg was amputated, the patient's blood pressure droppe to zero, despite continuous blood transfusion, and amputation of the second leg was delayed for 45 minutes while resuscitative measures were administered. During surgery 1,500 cc. of blood were given. Detailed pathologic and bacteriologic studies on the specimens are to be reported elsewhere.[23]

The pulse rate ranged between 128 and 140 for 10 days after operation. Electrocardiograms during this time revealed only sinus tachycardia. Despite the persistently rapid pulse the patient's general condition appeared much improved within 48 hours after surgery. She appeared less toxic, and her appetite, which had diminished with the occurrence of drug sensitivity and toxicity, was now back to normal.

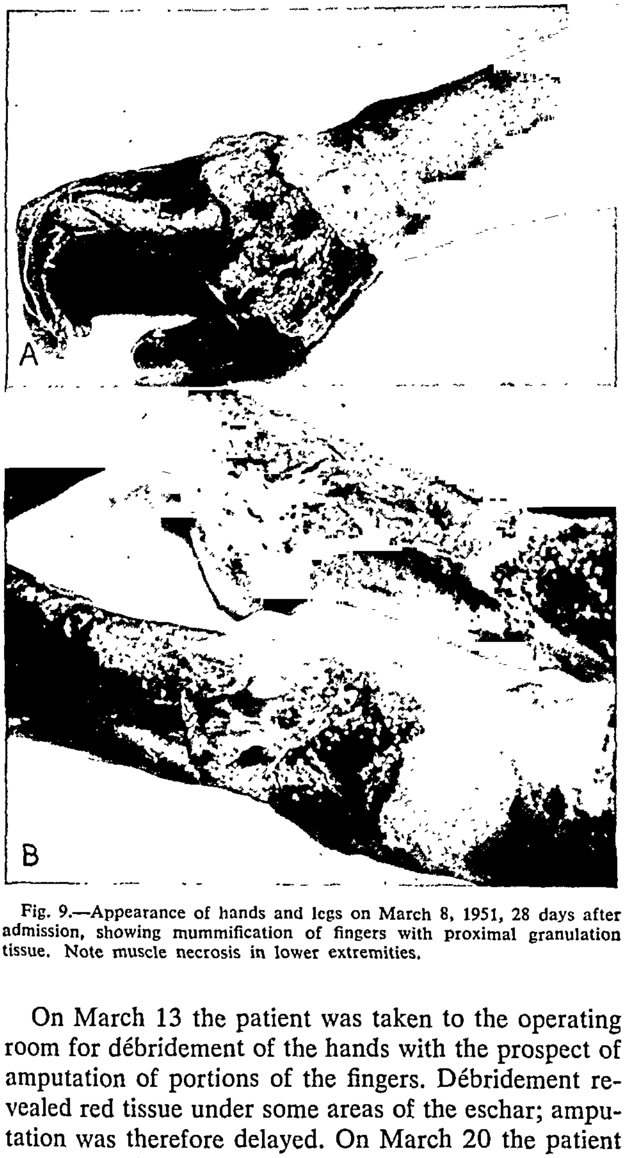

Fig. 9.—Appearance of hands and legs on March 8, 1951, 28 days after admission, showing mummification of fingers with proximal granulation tissue. Note muscle necrosis in lower extremities.

On March 13 the patient was taken to the operating room for débridement of the hands with the prospect of amputation of portions of the fingers. Débridement revealed red tissue under some areas of the eschar; amputation was therefore delayed. On March 20 the patient was returned to the operating room, at which time it was apparent that amputation of some of the fingers would have to be performed. Guillotine amputation was done through obviously mummified tissue, and the proximal eschars were removed. This procedure was carried out in the hope that spontaneous separation of necrotic from viable tissue would result in greater preservation of the digits.

On April 6 thick split skin grafts from the thighs were applied to portions of both leg stumps. The patient was returned to the operating room on April 12 for skin grafting of the remaining areas of the leg stumps. It was our impression that split thickness grafts did not take as well on frostbite granulation, as had been our previous experience in burn cases. Although the granulation appeared very healthy and compressed, we obtained no better than 60% takes in our grafting.

On May 3 the patient was returned to the operating room, where final débridement of the fingers was done. The only completely normal digit of the hands that remained was the left thumb, which underwent several episodes of peeling as well as loss of the nail. The four fingers of the left hand remained only as stumps of the proximal phalanges. Tissue loss on the right hand consisted of the loss of all digits, including the heads of all metacarpals. The first metacarpal was necrotic in its distal half. All that remained of the right hand was the palm.

Subsequent care consisted of dressings and treatment of a Pseudomonas aeruginosa infection of all wounds with dilute acetic acid at each dressing. Under careful guidance of special nurses the patient learned to hold a fork and spoon in her left hand by means of opposing the thumb to the stump of the forefinger. She soon learned to hold a pencil and crayons in this manner and underwent a systematic process of learning to write. Occupational therapy consisted of teaching her to control implements of various types and to make such objects as leather folders.

On May 20 physical therapy was begun. The result was excellent, in that full range of motion of both knees and both wrists was obtained within a short time.

The patient complained about gaining too much weight and asked to be placed on a reducing diet. Her frame of mind was excellent, and it improved as she learned to do things with the remaining thumb. The appearance of the extremities on June 28, 1951, is shown in Figure 10. The lower limb stumps were revised on July 16 to accommodate prostheses. The patient was discharged to a convalescent home on Aug. 8, 1951, six months after admission, where she awaited fitting of lower limb prostheses.

COMMENT ON POST-HYPOTHERMIC SEQUELAE

The sequelae that have been described in this case were apparently much severer than those described in previous reports of human hypothermia. They occurred in the presence of what we believe can be considered good present day treatment.

The severest physiologic sequelae in our case occurred within the two-week period following exposure. They were reflected in most of the body systems, predominantly in electrocardiographic changes and in alterations in water and electrolyte metabolism. During this period there occurred an apparent hypervolemia with concomitant hypertension, sodium retention, and azotemia. Attempts to analyze the basis for these deviations from the normal led us to the supposition that actual anatomic damage to the kidney was superimposed on the functional derangements in such organs as the adrenal gland, the kidney, and the heart. This damage was evidenced by the presence in the urine of degenerated renal cells containing fatty droplets, which appeared in the early post-hypothermic period. In another sense, the presence of gangrenous peripheral tissues (hands and legs) may have superimposed further functional deviations through absorption. Evidence for this may be seen in the extremely high potassium excretion and the disappearance of hypertension after the amputations.

---

[23] Laufman, H.: Pathological Findin Case of Pr d Hypothermia with Severe Frostbite, unpubli

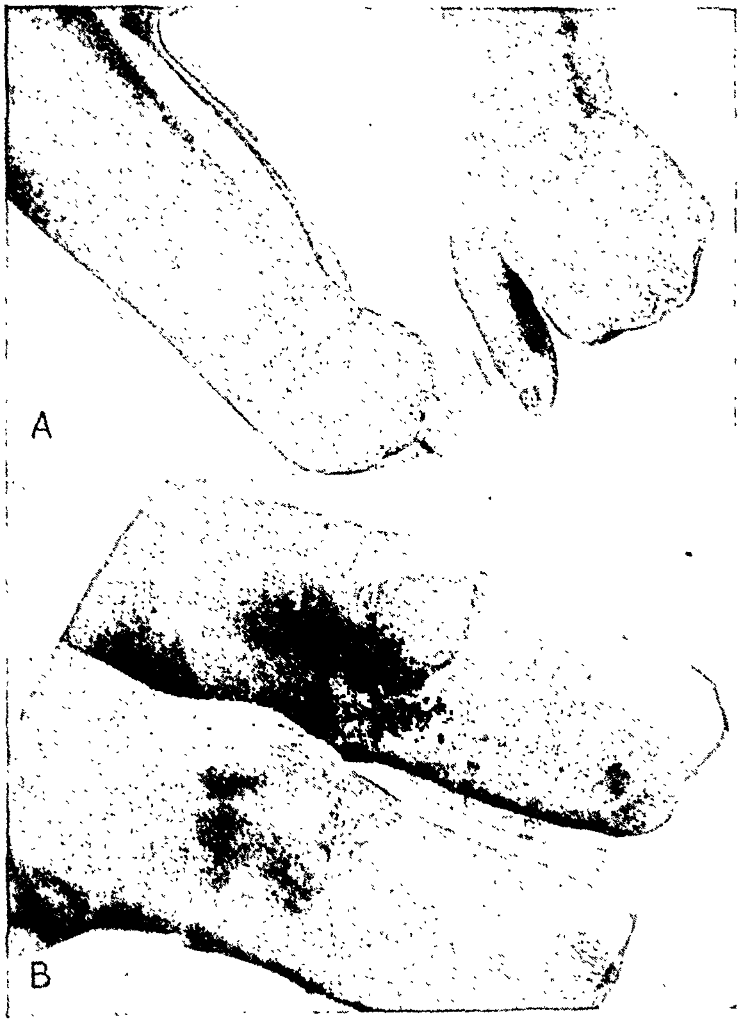

Fig. 10.—Final appearance of hands and legs on June 28, 1951, after healing of extensive skin grafting. Motion in all joints was excellent.

The destruction of peripheral tissues due to frost injury presents a difficult therapeutic problem insofar as it is necessary to balance the ill-effects from absorption against a conservative surgical standpoint in which one wishes to preserve the maximum amount of tissue by allowing demarcation to take place.

It appears that some of the views concerning the pathogenesis of frostbite injury to tissues in milder cases require reevaluation when applied to severer cases. For example, in milder cases the loss of viability in peripheral tissue following frostbite is apparently the result of vascular spasm and thrombosis.[24] Observations in a severer case, such as ours, indicate that the loss of viability resulting from direct thermal injury is more responsible for irreversible damage to tissue than is vascular occlusion. Evidence for this is based on the presence of patent, spurting arteries in the midst of necrotic muscle tissue at the time of débridement, as well as the pathologic findings in the amputated lower extremities. At least as far as muscle involvement is concerned, we consider thermal injury rather than vascular occlusion the cause for tissue necrosis in this case. This view coincides with that of Stein [25] and with recent experimental work of Lewis.[26] We found viable superficial granulation tissue and grossly viable fascial structures with underlying necrotic muscle. We feel that this can probably be explained by the fact that muscle is a highly specialized tissue that cannot recover as muscle tissue. It either is destroyed or heals b connective tissue scar. Thus identical exposure of muscle and other less specialized tissue can result in destruction of muscle tissue and not of other tissue.

Anticoagulant therapy was begun 12 hours after admission and continued for some 22 days at therapeutic levels. Yet this therapy had no observable effect on the preservation of tissue. Recent work has indicated that anticoagulant therapy, if begun early enough, is of value in milder cases of frostbite.

We cannot explain the fact that one digit retained its viability despite the fact that it underwent the same apparent degree of frostbite and exhibited the same earl stages of tissue change as did the other digits. There appears to be an urgent need for intensive animal experimentation to answer several of the questions raise by the study of this interesting case. We feel that such experimentation should concentrate on physiologi studies and treatment of the more profound degrees o hypothermia and frost injury to tissues, since it appear from our study that conclusions reached in much of th work on milder degrees of cold exposure do not appl to the severer types.

Genetics and the Environment.—One of the earliest and farthes reaching fallacies in the philosophical approach to human prob lems was the belief that if a genetic basis were demonstrated fc a certain trait, that trait could not be subject to environment modification; and conversely, if a trait were shown to be influ enced by the environment, it could not at the same time b genetically determined. Although many of us have for yea called attention to this fallacy, it still crops up in the literatur especially that of medicine, sociology, psychology, and educatio

There is usually an element of fear present in the case of th heredity-environment fallacy. For the physician, there may b a certain reluctance to accept the genetic basis for a disease o anomaly on the grounds that it would thereby be useless t attempt therapy. For the sociologist or psychologist, the reluc tance involves the fear that new or changed attitudes could nc be brought about if there were any genetic basis for the origina development of individual differences in behavior.—Laurence H Snyder, M.D., Old and New Pathways in Human Genetics, *Th American Journal of Human Genetics*, March, 1951.

RECURRENT THROMBOPHLEBITIS IN OBSCURE MALIGNANT TUMOR OF THE LUNG

REPORT OF FOUR CASES

Martin M. Fisher, M.D., New York, Lew A. Hochberg, M.D.
and
Nathan D. Wilensky, M.D., Brooklyn, N. Y.

In a review of the literature on thrombophlebitis it was noted that Trousseau[1] observed that recurrent phlebitis may be the first sign that obscure carcinoma of a visceral organ is present. He attached diagnostic significance to the occurrence of thrombosis in cancer, demonstrating instances of latent cancer of the stomach in which peripheral venous thrombosis was the first symptom to attract attention, as indeed it was in Trousseau himself, who died of gastric cancer. Gouget[2] reported a case of widespread venous thrombosis of eight months' duration; it was the only affection observed during the patient's life, but at necropsy a small gastric cancer was found. Osler and McCrae[3] observed absence of gastric symptoms and 15 different thrombosed veins in a latent case of gastric carcinoma with profound and progressive anemia. Welch[4] in his review emphasized that thrombosis is a recognized complication particularly associated with cancer. He stated that latent and milder types of venous thrombosis of the extremities occurred in cancer and cachectic states, while the severer manifestations of thrombophlebitis occurred in infectious diseases and post partum. He also noted instances of pulmonary infarcts with the latent mild thrombophlebitis of cancer. James,[5] Smith,[6] and Thomson[7] later confirmed this observation. Haward[8] reviewed the incidence of fatal venothrombosis in 2,903 consecutive autopsies, wherein he concluded that carcinoma was second as a predisposing factor. Barker,[9] in analyzing 166 cases of peripheral thrombophlebitis, found that carcinoma was the most frequently associated condition. He also emphasized that thrombophlebitis may be the first clinical manifestation of obscure visceral carcinoma, particularly of the lung or pancreas. He further concluded that in elderly patients in whom thrombophlebitis of either small or large veins develops with a minimal periphlebitis reaction, visceral carcinoma should be suspected if no other cause is apparent. Cooper and Barker[10] reported four cases of recurrent venous thrombosis with obscure visceral carcinoma. One of their patients had a carcinoma of the lung, which was not diagnosed until the autopsy; the carcinoma almost completely occluded the superior vena cava and right main bronchus. The first symptom had been a thrombophlebitis of the calf, which had preceded localization of the tumor in the leg by 18 months. There had been widespread repeated episodes of thrombophlebitis, involving in rapid succession the superficial veins of both lower extremities, the right basilar, axillary and subclavian veins. The patient's symptoms, signs, and x-rays pertaining to the chest had been interpreted as a pulmonary infarct because of the frequent thrombotic phenomena.

The following histories illustrate incidences of thrombophlebitis, antedating primary pulmonary neoplasm, which failed to respond to adequate anticoagulant therapy. Three of the patients had recurrent thrombophlebitis and were considered at one time to have thromboangiitis obliterans.

REPORT OF CASES

CASE 1.—I. R., a 43-year-old white man, was admitted to a hospital on Feb. 28, 1949, complaining of generalized weakness and pain in his left ankle and forearm. Four weeks previously he had had a hemorrhoidectomy after considerable rectal bleeding. His hemoglobin at that time was 56%, and his red blood cell count, 2,450,000.

At the time of this hospitalization, physical examination revealed a well-developed, well-nourished white man. There were no significant positive findings on admission and the patient was treated as a post-hemorrhoidectomy convalescent, with a secondary anemia.

Three days later there was noted a tender reddened area over the right triceps muscle. This subsided in two days. On the next day pain in the right calf and right forearm indicated a palpable vein in the right forearm. At this time a positive Homans' sign was elicited in the calf. A complete roentgenographic study, including x-rays of the chest and gastrointestinal tract, and a blood study were noncontributory.

Two days later there were phlebitic lesions of the lesser saphenous vein of the right leg and of the right elbow veins, associated with tender palpable veins with streaking along their courses. By this time the phlebitis of the right forearm and calf had subsided. Two days later an area of induration and tenderness was noted in the left posterior thigh region. A week later, thrombosis of the right external jugular vein was observed. The vein was tender and palpable for 3 cm. This was the seventh independent thrombosed vein found in 17 days of observation.

From the Medical Service of Dr. Joseph G. Terrence and Chest Surgical Service of Dr. Lew A. Hochberg, of Kings County Hospital, Brooklyn, N. Y.

Drs. William Dock, Joseph G. Terrence, Milton Kaplan, and Jacob Plotkin cooperated in the preparation of this paper. Miss Marie Piccione gave technical assistance.

The case was now completely reevaluated. That this was not a true thromboangiitis obliterans could not be ruled out, despite the adequate peripheral arterial circulation as well as the rapidity of the repeated attacks of phlebitis. It was felt that an obscure cancer or disseminated microarteritis, more commonly called periarteritis nodosa, had to be ruled out, even though the rarity of migratory phlebitis in the latter syndrome was understood. A biopsy of a vein in the involved area was performed and reported as negative for disseminated microarteritis and thromboangiitis obliterans, but the trichinosis precipitin test was positive in a titre of 1:640. We felt, therefore, that we were dealing with an obscure cancer.

One week later the patient's left calf swelled to twice the circumference of the uninvolved leg. There was pain in the left thigh with marked tenderness in the left calf. Homans' sign was positive. The left femoral vein was palpably thrombosed. This was the eighth site of a phlebitic lesion, the previous seven having all subsided. X-rays of the thoracic and cervical vertebras were repeated and revealed a metastatic lesion of the fourth lumbar vertebra. Heparin and bishydroxycoumarin (dicumarol®) therapy were instituted to prevent further thromboembolic phenomena. Two days later an anterior chest pain developed, which was diagnosed as a small pulmonary infarct. Eight days after administration of adequate anticoagulants, edema of the left ankle was noted. This was associated with pain and calf tenderness. The swelling progressively extended beyond the knee to the inguinal region. At this point the patient began to fail rapidly. X-rays of the chest were repeated and a diagnosis of a primary carcinoma of the lung was made. Three days later, while still under anticoagulants, the patient reported pain in his right foot. On the next day the left foot became painful and cold and lost sensation. In 48 hours, gangrene of the right foot set in, and the next day there was bilateral foot gangrene. The patient became more cachectic and died on April 15, 1949.

At autopsy a peripheral adenocarcinoma of the right lung was found. The tumor was found in the most superior portion of the right lower lobe and measured but 1 cm. in its greatest diameter. In the left lower lobe there was a pulmonary infarct. Metastatic carcinoma involved the fourth to the eighth thoracic vertebras and the fourth and fifth lumbar vertebras, including the superior portion of the sacrum.

The small 1-cm. lesion found at autopsy was not recognized early on a routine roentgenogram of the chest. It is noteworthy that the symptoms referring to the chest were not present until development of a pulmonary infarct.

The absence of symptoms referable to the chest does not exclude the possibility of a primary cancer of the lung. Primary tumor of the lung in the parenchyma or periphery rarely presents many symptoms. The size of the primary lesion bears no relation to the possibility of diffuse metastasis.

Although the pathologist was unable to demonstrate local venous thrombosis at the areas of metastases, we feel that the venous stases at these areas predisposed to the thrombophlebitis.

In this patient, we observed 10 different thromboembolic phenomena involving all four extremities, including a pulmonary infarction and bilateral foot gangrene. Despite adequate anticoagulant therapy, we observed no effect in preventing further thromboses. The new thrombophlebitis preceded the localization of the primary focus in the lung by one and one-half months.

Case 2.—V. G., a 43-year-old male butcher, was referred to us by Dr. Milton Kaplan. While at work, the patient had scraped his left leg on a metal corner. He had immediately consulted a physician, who had treated him for a phlebitis of the left le This had subsided in four days. Several days later a phlebi of his right leg had developed, which had subsided in thr days. A week later there was development of phlebitis of t left arm. He had then been hospitalized with a provisional dia nosis of thromboangiitis obliterans. One week later, after ho pitalization, a sudden pain occurred in the right part of chest, which was treated as a pulmonary infarct of the rig lung. X-ray of the chest confirmed the infarction. At this tir anticoagulant therapy was instituted. After one week, desp adequate anticoagulant therapy, there was a recurrence of t phlebitis in his left leg. This was greater in extent and intens than the previous involvement, with marked edema associat with swelling up to the loin. This phlebitis subsided in one we and the patient was then discharged for home care. After bei home for two days, he suffered an intense back pain localiz at the level of the lower thoracic vertebras. He was then reh pitalized. X-rays of the thoracic vertebras were interpreted showing a mild osteoarthritis of the eighth thoracic vertebra.

After he had been in the hospital for six weeks, he continu to run a low-grade fever. During this time, he had lost 40 (18 kg.). His clinical picture was reevaluated, and the suspici of a cancer or a chronic pancreatitis was entertained. While t patient was in the hospital, six months after the onset of t original illness, a chain of palpable lymph nodes developed his left cervical and supraclavicular regions. Simultaneous there was a recurrent phlebitis of the right brachial vein, whi subsided in four days. Then a cervical lymph node was remov and reported as metastatic adenocarcinoma. Review of the pre ous x-rays of the chest taken for the pulmonary infarct, in vi of the biopsy results, made us suspect the presence of a neoplas On April 1 Horner's syndrome on the left side and paralysis the right side of the face with developing hoarseness were not By the next day the patient was barely able to utter soun and 24 hours later a complete right hemiplegia developed. family took him home with the knowledge that he would shortly. The day after leaving the hospital, he lapsed intc coma and died.

Autopsy findings revealed a large circumferential peribr chial adenocarcinoma, 5 cm. in diameter, in the right up and middle lobes. There was marked enlargement of the med stinal lymph nodes, each 3 cm. in diameter. The right lung ba which was the location of the previous pulmonary infarct, necrotic. The brain had a small pea-sized encysted area of tun tissue in the left parietal region. There was metastasis to eighth thoracic vertebra.

A thrombophlebitis developed in this patient's l which originally appeared to be the result of traun Subsequent to this, there was rapid development o thrombophlebitis in the opposite leg, a pulmonary farct, thrombophlebitis of both upper extremities, a then an iliofemoral thrombosis. Adequate anticoagul therapy had no effect in preventing the thromboembc phenomena. This patient likewise had metastasis to thoracic vertebras. The recurrent thrombophlebitis p ceded the recognition of the primary focus in the lung six months.

Case 3.—E. S., a 42-year-old white man, was referred to of us by Dr. Jacob Plotkin. The patient complained of pair the right leg of 10 days' duration, associated with intermitt claudication. Physical examination was essentially negative. oscillometric readings were normal. There was no evidence thrombophlebitis; nor were there symptoms referable to chest at this time. Three months later, in Aug. 1947, the pati returned with evident thrombophlebitis of his left leg associa with swelling, streaking and a palpable vein. The diagnosis thromboangiitis obliterans was made. Intravenous typh therapy was instituted, and the patient was advised to stop sm ing. One week later, after he had received five injections typhoid vaccine, the thrombophlebitis subsided. Despite typhoid therapy, after another week streaks over the inner aspect of the right elbow and left ankle were noted. After four more days thrombophlebitis subsided in these areas.

One month later the patient complained of pain in the right part of his chest. He was then reexamined and fluoroscoped, whereupon elevation of the right dome of the diaphragm was noted. He was then hospitalized for further investigation. After he had been in the hospital for two weeks, a right pleural effusion developed which produced dyspnea. The chest was tapped and 250 cc. of clear, colored fluid was removed. A cell block was made of the sediment, which was found to contain many abnormal cells with mitotic figures. This was reported as anaplastic carcinoma of the lung. X-rays of the chest following the removal of the fluid revealed a definite mass 8 cm. in diameter in the right middle and upper lobes of the lung. This was interpreted as a primary malignant tumor of the lung. The patient began to fail rapidly. During this time multiple areas of recurrent thrombophlebitis developed in his upper and lower extremities. The thrombophlebitis recurred and disappeared in rapid succession. He was sent home after two months of hospitalization and died three months later after developing a superior vena cava syndrome, as well as convulsive seizures. No autopsy was performed.

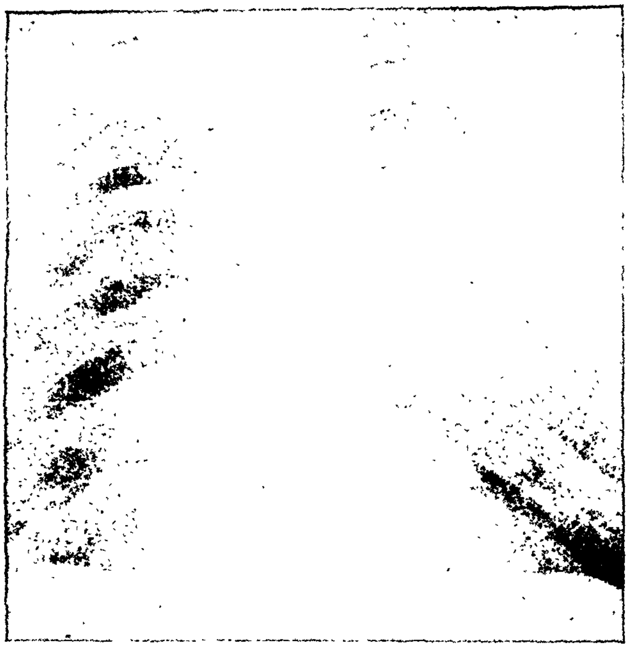

Fig. 1.—Posterior-anterior view of the chest. Note the large circular mass in the left lung field.

This patient, like the other two, had recurrent thrombophlebitis with many different bouts; each was of short duration and subsided spontaneously. The thrombophlebitis preceded the identification of the primary tumor in the lung by four months.

Case 4.—J. K., a 66-year-old man, was first seen when he complained of the painful swelling of his right ankle, of three months' duration. The pain in the ankle was located along the medial malleolus, with swelling extending up to the calf. There were calf tenderness and a positive Homans' sign. Two and one-half months after the onset of the thrombophlebitis he developed a cough and dyspnea.

The patient was hospitalized and a diagnosis of carcinoma of the lung was made (Figs. 1, 2 and 3). X-rays showed a large mass 10.5 cm. in diameter in the left lung. Pneumonectomy was performed and the diagnosis of carcinoma of the lung confirmed. The patient was discharged after two weeks and his follow-up for nine months postoperatively was uneventful.

This patient had but one episode of thrombophlebitis, which preceded the diagnosis of the primary lung tumor by three months. There has been no recurrent episode of thrombophlebitis since the removal of the primary focus.

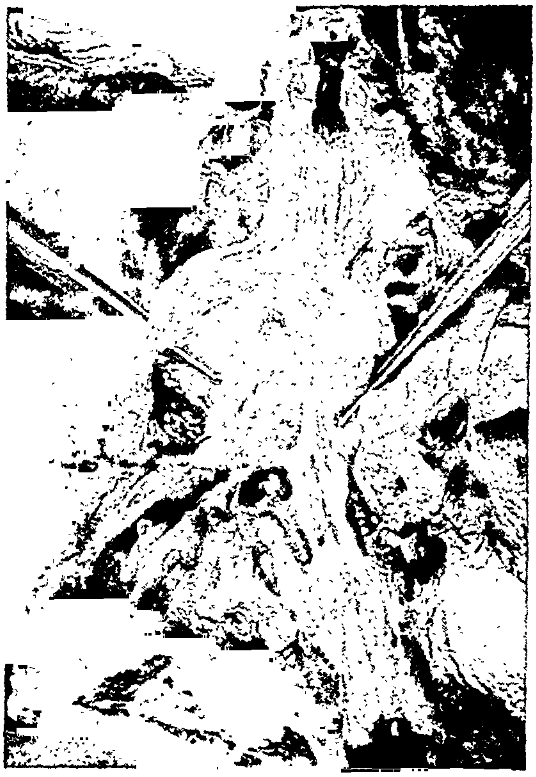

Fig. 2.—Close-up of the pneumonectomized left lung, revealing the shiny, white, infiltrating, gross appearance of the tumor tissue.

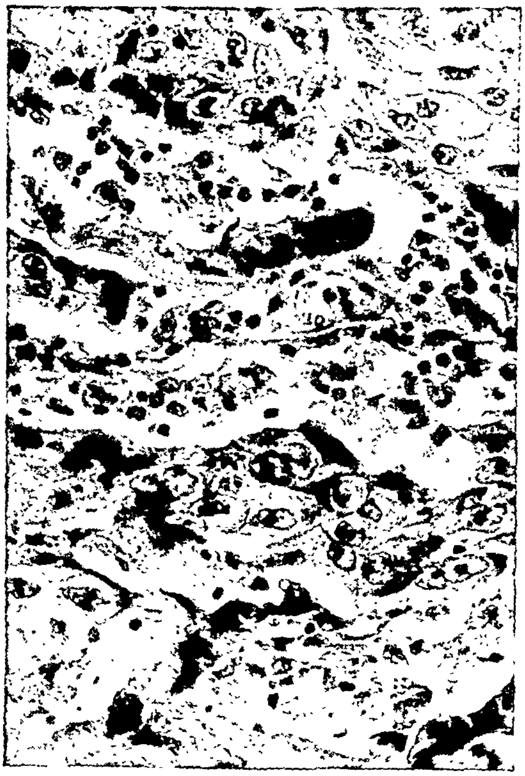

Fig. 3.—Primary adenocarcinoma of the lung, evidenced by cell structure (× 367).

COMMENT

Clinically, lesions of superficial thrombophlebitis associated with carcinoma are characterized by thrombosis of the vein with little evidence of inflammatory reaction, and they subside in a few days. Usually they can be distinguished from the lesions of idiopathic recurrent thrombophlebitis and from those of superficial thrombophlebitis that occur in thromboangiitis obliterans. The histological picture of thrombophlebitis associated with carcinoma reveals relatively few fibroblastic cells in the thrombus and only a minimal degree of inflammatory reaction in the media and adventitia coats of the veins. This picture would indicate why this type of phlebitis clears up after a few days with little residuum, whereas lesions of superficial thrombophlebitis show much more fibroblastic proliferation and slower resolution.

In the last 10 years at the Kings County Hospital, there have been 934 known cases of carcinoma of the lung; of this group, 525 patients died of carcinoma of the lung. Cancer of the lung is so closely linked to the modern attack on other types of cancer that some observers [11] believe that this disease is actually increasing. Others [12] argue that it is only being identified more accurately in recent decades. All [13] agree that it is more frequently encountered and is one of the most important types of malignant disease in the male, second only to cancer of the stomach. There is no explanation for the remarkable fact that primary cancer of the lung is six to eight times as common in men as it is in women. The actual cause of lung cancer is as obscure as that of thromboangiitis obliterans.

As with other neoplasms, early diagnosis is of paramount importance. The diagnosis of a parenchymal lesion is often overlooked for long periods because of the paucity of symptoms and signs relative to the chest. Routine x-rays of the chest may not give definitive information in early cancers of the lung, but tomography may. Bronchoscopy may reveal early cancers in the large bronchi in about 60% of the cases. The microscopic examination of the sputum for cancer cells has gained in accuracy in the hands of trained diagnosticians, making available another adjunct for early diagnosis of cancer of the lung. Occasionally the shadow cast by x-rays is sufficiently suggestive of a tumor. Serial x-rays are indicated on suspicion alone.

The present methods used for determination of increased coagulation of the blood have failed to give any accurate approaches to the treatment of thromboembolic phenomena. Recently, Ochsner and DeBakey [14] reported the use of aqueous alpha tocopherol intramuscularly and calcium intravenously to control the antithrombin titre and thus prevent further thromboses. Further investigation should help confirm their valuable findings.

Sproul [15] found in a post-mortem study of 200 cases of carcinoma of the kidney that the renal vein or vena cava was involved in 22.5% of the cases. Sproul also reported thrombosis present in 56% of cases of carcinoma of the body or tail of the pancreas. In 31% of the cases, thrombosed vessels were observed in various parts of the body. It was assumed that some change in the coaguability of the blood must occur in many of these cases of carcinoma associated with thrombophlebitis.

It is worthy of emphasis that recurrent thrombophlebitis of the patients reported herein preceded the localization of the lung tumor by one and one-half to six months. The phenomenon may have occurred at a stage too early for detection of the neoplasm and antedated any definite signs or symptoms of the lesion of the lung.

SUMMARY

We have presented four cases of carcinoma of the lung: All patients were men, three of whom were suspected of having thromboangiitis obliterans, and all had clinical attacks of thrombophlebitis.

It is suggested that recurrent thrombophlebitis of adult males should be considered as a warning sign of hidden carcinoma. It is felt, as a result of this study, that early recognition of the second attack of thrombophlebitis, regardless of its location, mildness of intensity or shortness of duration, should result in a thorough and continuous study to rule out a developing cancer of the lung. It is our opinion that many of those patients who were previously considered to have had recurrent idiopathic thrombophlebitis, if studied persistently, would have been found to have had a latent visceral cancer. It is further suggested that when adequate anticoagulant therapy does not prevent further thromboembolic phenomena, a cancer should be suspected.

Drug Metabolism.—The study of the metabolism of drugs can be valuable, not only in elucidating their mode of action, but also in the search for more useful drugs. One might find that it is better to use as a drug an *active metabolite rather than the* original substance or one might be able to avoid the toxic effects of a drug by modifying its structure so that it does not produce toxic metabolites. . . . Furthermore, the duration of action of a drug may be determined by its rate of transformation to inactive metabolites . . . and it may be possible to synthesize a drug whose duration of activity is known beforehand because one can predict from its structure its metabolic fate. These suggestions, however, presuppose a fund of fundamental knowledge concerning the fate of all kinds of organic structures. This knowledge has, as yet, only been partly acquired, but the prospects of acquiring it with new techniques . . . are bright.—R. T. Williams, *Annual Review of Biochemistry*, Stanford, Annual Reviews, Inc., 1951, p. 442.

APPLICATION OF THE LAND METHOD OF FILM PROCESSING IN ROENTGENOLOGY

PRELIMINARY REPORT

Laurence L. Robbins, M.D.
and
Edwin H. Land, Sc.D., Boston

A new one-step, essentially dry photographic process was publicly described in 1947.[1] The process had certain desirable features that made it applicable to roentgenography. This paper describes a joint program of investigation into certain roentgenologic applications of this process which utilized the technical facilities of the Polaroid Corporation and the medical facilities of Massachusetts General Hospital.

Because the program has amply demonstrated the immediate applicability of the method in particular instances, a preliminary description and discussion is necessary.

PROCESS

The Land process used in radiology is similar in its essentials to that used in amateur photography.[2] Several modifications have been made, however, in the physical form of the materials and equipment.

The process utilizes two sheet materials, a negative sheet bearing a light-sensitive emulsion and a positive sheet on which the permanent positive radiograph is produced. The positive sheet bears a special coating which is not sensitive to light. The Land X-ray Pack consists of a negative and a positive sheet, joined to a common leader. The negative sheet is enclosed in a light-tight black paper envelope to permit handling and loading in daylight.

The necessary processing reagents, in the form of a viscous jelly, are contained in a thin pod attached to the leading edge of the positive sheet. The pod is hermetically sealed to protect the reagents against moisture and water vapor before use. It is so constructed, however, that when it is subjected to pressure it will burst along one edge and permit its contents to spread between the sheets to form a thin "sandwich."

A special cassette has been developed for this pack. In appearance it resembles a standard casette and may be handled as such after loading, which may be done without the aid of a darkroom.

Only one intensifying screen is required, since only a single emulsion coat is to be exposed. The screen is removable. To load the cassette, the back is removed, the pack laid within, and the intensifying screen placed between the negative envelope and positive sheet. The back of the cassette is then attached and latched, and the black envelope is removed from the negative by pulling a tear-string and withdrawing it through the end of the cassette. Pressure is then applied by means of a lever to assure uniform contact between the screen and the sensitive emulsion. The cassette is now ready for exposure in the ordinary way (Fig. 1).

After exposure, the cassette is placed in a small box, the chief function of which is to withdraw the pack, but not the intensifying screen, from the cassette and pass it between motor-driven rolls into a compartment where development takes place (Fig. 2). The rolls break the pod, causing the reagent to spread in an extremely thin, uniform layer between the negative and positive sheets. Processing is complete within one minute, after which the sandwiched sheets are taken from the box and peeled apart. The negative sheet is discarded, while the positive sheet, instantly dry, is ready for examination.

The personal labor factor is practically nil. The technician need only place the cassette in the box, relieve the pressure on the pack, and press the motor switch. The rolls stop automatically.

During the one-minute development period, a complex set of reactions takes place. The developer present in the reagent reduces the exposed silver halides of the negative emulsion to metallic silver. Meanwhile sodium thiosulfate (hyposolution) also present, dissolves the unexposed halide to form a silver halide complex. The silver of this complex is deposited in the form of metallic silver upon the positive sheet to produce a positive of the developed negative. Owing to the extreme thinness of the reagent layer and the fact that the images formed are produced in the surface layers of the sheet materials, the reactions involved run to completion rapidly, and minimum opportunity is afforded for degradation of the positive image from random migration of the dissolved silver halide complex. Thus, accurate duplication of the developed negative image with a reversal of density values is obtained upon the positive sheet.

In one form of the process, heavy metal sulfides aggregated in galaxies of chosen diameter and so maintained throughout the process are used cyclically to deposit the silver of the silver thiosulfate complex in arrays of desired diameter and constancy of diameter. The less readily reducible thiosulfate transports the silver ions from the negative and gives up its silver to the heavy metal sulfide at the site of the positive to form the more readily reducible silver sulfide. The reduction of the silver sulfide completes a chain of reactions in which the thiosulfate and the silver ions are freed for further reaction. Cyclic use of sodium thiosulfate and sulfide and the preservation of the sulfide ion by the presence of an excess of metal ions makes possible the formation of a dense image with but trivial amounts of silver solvent and sulfide ion. Integrated with these reactions are further chemical mechanisms which operate to give the positive print acceptable permanence without aftertreatment.

APPLICATION TO ROENTGENOGRAPHY

Technical Details.—At the present time the x-ray exposure is made with higher factors (as much as 8 to 15 kv.) than would be employed for ordinary x-ray film in a similar examination. It seems reasonably certain, however, that in the future the factors can be reduced to the same as, or possibly even less than, those used with conventional film. One-minute processing, coupled with daylight loading, results in a marked decrease in time over other types of processing which have been tried in the Massachusetts General Hospital. Therein lies the great advantage of the method. Speed is of course extremely valuable in operating room procedures such as the nailing of fractured hips, the reduction of fractures, and the removal of foreign bodies. The method was successfully employed during nailing of hip fractures and it was estimated that because of it at least one hour was saved, thus shortening the operating as well as the anesthesia time.

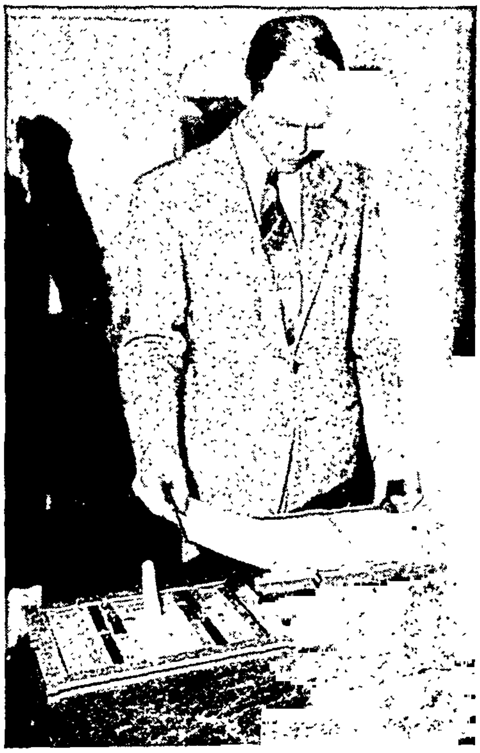

Fig. 1.—Daylight loading of cassette.

The method has practical value also in the examination of traumatic conditions suffered by patients admitted to the emergency ward. In seriously injured or acutely ill patients, the availability of a roentgen examination which furnishes within one minute's time an image of the part in question may well prove lifesaving.

If a gross fracture is clearly demonstrated by the rapid processing technic, no further examination may be needed. If no fracture is recognized, however, in order to satisfy appropriate conservatism as regards the care of the patient and until further experience has proved the absolute consistency of this particular method, the routine roentgenographic examination is carried out.

There also appears to be immediate usefulness of the process in other fields of endeavor, particularly the military.

Comparison of the Method with Routine Examination.—Up to the present time, check-up study has confirmed the findings of the faster method. It would seem that approximately the same amount of information is obtainable from a properly exposed positive print as from the usual x-ray film, although it may take somewhat longer to recognize the abnormalities (Fig. 3). There is perhaps slightly less latitude permissible with the use of paper prints than with ordinary film; the technician must be even more accurate in selecting the correct exposure factors. The contrast range with the two technics is fairly comparable when the proper exposures are made. Of considerable importance is the fact that definition and detail have been shown to be as good on the paper print as on the ordinary film under optimum exposures.

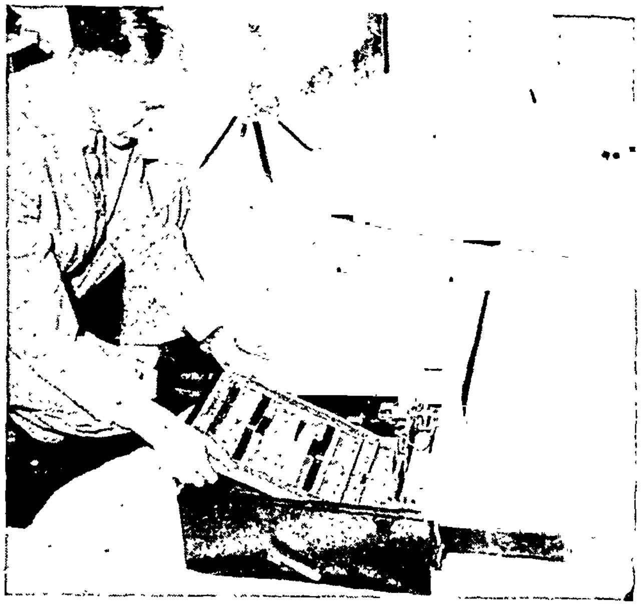

Fig. 2.—Insertion of the cassette into processing unit.

Certain factors limit overwhelming enthusiasm for, and widespread application of, the method to roentgenography. None of these factors, which are briefly reviewed, seems, however, to be irremediable.

1. The fact that the examination is made on paper and therefore requires observation by means of reflected light results in a certain loss of density range which is not presented by the usual transparency. Reflected light m seem inadequate to the roentgenologist, and because this type of lighting his difficulty in obtaining as mu information from the paper print may prove a limiti factor. Since transparent prints made by the proce have already been announced in the camera field, it is be expected that they will be made available for roe genography.

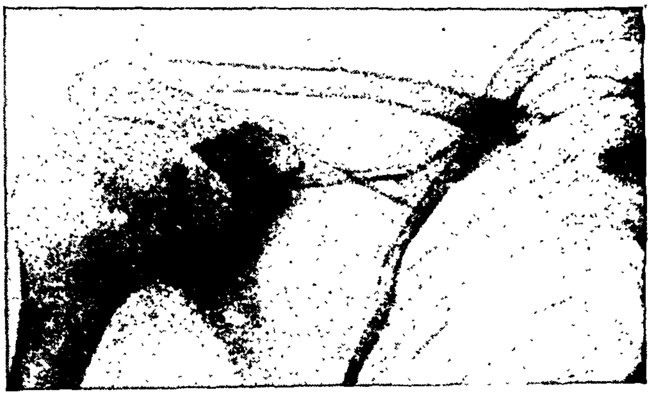

Fig. 3.—Anteroposterior view of a shoulder.

2. Experience has shown that even though roentgenologists are in the habit of seeing positive images fluoroscopically, some may experience a definite aversion to viewing a positive print. Whether this is related to the physiology of rod and cone vision or is simply due to habit is not certain, but there is no doubt that the average roentgenologist prefers to view the object in a negative phase as well as in a transparent form.

3. The present size of the print restricts roentgenographic application of the method. The film packet now available is approximately 9 by 9 in. (23 by 23 cm.), but there is every reason to believe that, in the future, larger sizes, up to 14 by 17 in. (36 by 43 cm.), as well as smaller sizes, will be obtainable. Complete examination of either the chest or the abdomen on a single print is not yet possible; *the optimum present use of the method lies in examination of the extremities and the skull*, and in certain operating room procedures for which the current-sized print is adequate.

4. When prints are to be handled considerably for reexamination, it has been found desirable to lacquer the image-bearing surface of the print, as it scratches somewhat easily. After lacquering, the prints can be handled in any ordinary manner without fear of scratching—that is, it can be transferred from the x-ray department to the wards, handled on the wards in no discriminating manner, and become no more scratched than an ordinary film. Any scratching that has occurred prior to lacquering has not been sufficient to eradicate the pertinent diagnostic points. It is anticipated that the high surface-resistance features of materials now being introduced in other fields will be extended to the materials used for x-ray work so that this lacquering will be unnecessary.

5. Under usual loading conditions the print, in contrast to a transparency, can be viewed only from the position of the x-ray tube. This may again reverse the habit of the roentgenologist, particularly in the examination of the chest, gastrointestinal tract, or gallbladder. It is not, however, a serious drawback as it can be overcome by inverting screen and pack within the cassette.

COMMENT

The future offers opportunities for further utilization of this method of processing. With it, accurate placement of radium needles may be determined in the operating room before the effects of anesthesia have worn off. It has already been used in photofluorography in a modified manner,[3] and its routine application may become possible.

It should be reemphasized that improvements are being made in the method and that it is undergoing constant change and revision. The limitations of today may be overcome tomorrow. It is expected that the future will see the development of varying sizes of film up to 14 by 17 in., the use of a transparent medium as well as paper, and faster emulsions. If required, consideration can be given to the production of the image in the negative, rather than in the positive, phase. When these developments become available, general use of the Land method in the processing of films in roentgenography can be anticipated.

CONCLUSIONS

1. A significant advance in processing of roentgenographs is described.

2. Although there are still certain limitations for general application of the method in roentgenography, none of them appears to be insurmountable.

3. Because of the speed of the method, the time required for roentgen examination can be markedly reduced. This reduction in the time element is advantageous for the roentgenologist, the surgeon, and, more important, the patient.

FATAL PAUSE IN DIAGNOSIS OF NEOPLASTIC DISEASE IN PHYSICIAN-PATIENT

Benjamin F. Byrd, Jr., M.D., Nashville, Tenn.

The problem of cancer has, in the past few years, been taken from the realm of darkness and dragged into the public eye. This is the same path that has been followed by poliomyelitis, syphilis, tuberculosis, and many other diseases having both a physical and social implication. A large part of the responsibility for bringing this problem into the public eye has been given to the physician, who in his role as healer and public servant has worked steadfastly toward a better understanding of cancer, its diagnosis, and its treatment. This attitude on the part of the physician toward education, early diagnosis, and treatment is in direct contrast to his actions concerning his own situation in this matter.

The most important sources of professional education and information are schools of medicine and those hospitals having a residency-training program, but beyond these the American Cancer Society conducts an extensive professional education program. In the fiscal year 1949-1950 the American Cancer Society and its various component units spent better than $710,000 for such activities. This program was designed to stimulate interest in the problem of cancer on the part of the physician and to enable him to diagnose earlier and treat more efficiently malignant neoplastic disease. To evaluate the use made by the physician of his education and professional experience, a study was undertaken in two large metropolitan hospitals. The study had as its basis the physician-patient who was admitted to these two hospitals with neoplastic disease. My colleagues and I were interested in the char-

Medicine and the Surgical Services of the Vanderbilt
Thomas Hospitals.

acter of the neoplasm, its stage of development, and most especially in the time lapse between the onset of clinical manifestations and the initiation of adequate diagnostic study. The results that were found were on the surface surprising, but with an honest approach one may look within himself and easily find the true explanation.

During the period of 1925 to 1950 a total of 60 physicians were admitted to the two general hospitals concerned in this study. These men came from Northern Alabama, Middle Tennessee, and Southern Kentucky, a group representing a largely rural community. Less than 10% of these men might be called specialists. The other 90% come from the large and essential portion of our medical population in general practice. The primary site of the tumors in these patients is shown in Table 1. As might well be expected in a series of male patients, there are four predominant sites, the most frequent of which is carcinoma of the prostate, the second, carcinoma of the upper intestinal tract, the third, carcinoma of the large bowel, and the fourth, pulmonary neoplasms. There was only one woman in the series, and her presenting symptom was vaginal ulceration of six-months' duration. The distribution of the lesions is not remarkable in itself, but for the four sites principally concerned a breakdown has been carried out as to the extent of the lesion at the time the physician first presented himself for treatment and as to what operative procedure could be carried out at that time. Table 2 shows that only 7 out of a total of 37 patients had primary lesions without either extension to the regional lymph nodes or distant metastases. In only five of these physicians were curative procedures carried out. In fact, 13 patients (Table 3) were deemed inoperable at the time of their original hospitalization. In every instance and without delay the physician consulted made an adequate diagnosis and advised appropriate therapy. There are only two adequate explanations for this situation: (1) physicians as a group have more malignant neoplasms than the average run of the general population, which is difficult to believe, or (2) physicians show a greater negligence of their own disorders than in the management of patients who consult them professionally.

TABLE 1.—*Primary Sites of Neoplasms*

	Number		Number
Prostate	12	Central nervous system	5
Upper gastrointestinal tract	9	Upper respiratory tract	4
Lower gastrointestinal tract	9	Skin	3
Lung	7	All others	11
Total	60		

My colleagues and I carried further the study of the physician-patient and determined for each person concerned the time lapse between the onset of clearly suggestive symptoms and the initiation of diagnostic procedure. By clearly suggestive symptoms are meant those cardinal findings of persistent, severe cough, chest pain, or hemoptysis in the instance of carcinoma of the lung; of jaundice, dysphagia, vomiting, hematemesis, or melena in the instance of carcinoma of the upper gastrointestinal tract; of change in bowel habits, bloody stools, or recurring cramping abdominal pain in the instance of large bowel neoplasm. In every instance the time lapse indicated has been that between the onset of some one or more of these manifestations and the initiation, on t part of the physician-patient, of some effort at diagno or treatment. In Table 4 the average time lapse for ea disorder is shown. In no instance among those patier with large bowel neoplasm did the physician prese himself within the first three months after the onset some characteristic symptom.

TABLE 2.—*Extent of Neoplastic Process at Admission*

	Localized	With Metastases	Tot
Prostate	4 (33%)	8 (67%)	12
Upper gastrointestinal tract	0 (0%)	9 (100%)	9
Lower gastrointestinal tract	3 (33%)	6 (67%)	9
Lung	0 (0%)	7 (100%)	7

TABLE 3.—*Attempted Surgical Treatment*

Location	Curative	Palliative	No Opera tion
Prostate	2	6	4
Upper gastrointestinal tract	0	7	2
Lower gastrointestinal tract	3	4	2
Lung	0	2	5

During the past 10 years 32,737 physicians have di in the United States, of this total 9.89% of the deatl were due to cancer. In fact, 4.04% (Table 5) were d to cancer of the upper gastrointestinal tract alone. T tremendous importance of early diagnosis and tre ment of such prevalent and apparently highly fatal d orders cannot be overemphasized.

It is of interest that this same apparent negliger demonstrated by physicians in the field of neoplas disease is not carried over into various other types illness. Only last year it was pointed out that the diabe person was a "good risk" as a medical student from health viewpoint, that the life expectancy of the kno diabetic physician was only four-fifths of one year l than that of the average physician, and that the avera diabetic physician might well look forward to a l expectancy greater than that of his known medical cc temporary.

TABLE 4.—*Time Lapse Between Onset of Symptoms and Diagnosis, in Months*

Location	Longest	Shortest	Averag
Prostate	36	1	14
Upper gastrointestinal tract	24	1	9
Lower gastrointestinal tract	12	3	7
Lung	18	0	6
Central nervous system	6	1	3

TABLE 5.—*Relative Mortality of Physicians Due to Cancer 1940-1950*

Total No.	Due to Cancer	Due to Upp Gastrointest Tract Cancer Alo
32,737	9.89%	4.01%

Quite possibly this problem should have been proached by a psychiatrist rather than a surgeon, si lack of insight and mental blocks undoubtedly play dominant role. The facts remain that in the presen of neoplastic disease physician-patients present the selves for treatment later and that their cancers have comparably poorer chance of cure than those of t general population.

Vanderbilt University Hospital.

INTEGRATED TEACHING IN THE BASIC SCIENCES

REPORT ON FIVE YEARS' EXPERIENCE

Julius H. Comroe Jr., M.D., David L. Drabkin, M.D., William E. Ehrich, M.D.,
John A. Flick, M.D., Seymour S. Kety, M.D.
and
Wilton M. Krogman, Ph.D., Philadelphia

The Flexner report on "Medical Education in the nited States and Canada"[1] marked a turning point in e history of American medical schools. Among other ings, Flexner found that, at the time of his report, the boratory sciences were too much subordinated to clin- al teaching. This defect was gradually corrected by the hools. However, the Commonwealth Fund, in its nual report of 1950, has noted that the pendulum has w swung to the other extreme and that these sciences w stand too much alone, so that their relation to clin- al judgment is often left unclear in the student's mind. he Commonwealth Fund report emphasizes that

> . . the first two years of medical school are characteristi- lly split into discontinuous fragments and that the student is ven little help in putting them together. In the poorer schools e department may neither know nor care what another teaches. ven in the better ones, each department is for the most part a w unto itself. No school known to the Fund has yet brought the lf dozen medical sciences together into a comprehensible ole; none has thoroughly "kneaded them" as Flexner sug- sted; they remain for the average student pieces of a jig-saw zzle that so far as he knows was not even a whole picture to rt with.[2]

The concept of integrated teaching is not a new one. me schools have already integrated all teaching in a nited field (such as neurology), and many have insti- ted conferences correlating physiology and pathology ith clinical medicine and surgery. Some medical edu- tors have urged the complete breakdown of depart- ental barriers so far as teaching is concerned,[3] but to e best of our knowledge no school has put such a plan to practice.

Five years ago the Graduate School of Medicine of e University of Pennsylvania began an experiment in e integration of the basic medical sciences for instruc- on of graduate physicians. This has proved to be such successful method of teaching that we believe the gen- al plan should be called to the attention of all those terested in medical education. We hope that our ex- rience will give encouragement to medical faculties ho are giving serious consideration to such a program.

DEVELOPMENT OF PLAN

A brief account of the development of the plan may of interest. Within a period of two years, a new faculty as appointed in most of the basic science departments. the year 1946-1947, the newly appointed professor physiology and pharmacology gave a course of 90 ctures in physiology and pharmacology, in which these vo basic sciences were integrated with each other and rrelated with clinical medicine. In the middle of this ademic year a new professor of physiological chemistry as appointed. In addition to completing the regular course in physiological chemistry, he also presented several lectures on related chemical matters in the physiology-pharmacology course. Because this type of coordinated teaching made a favorable impression on the students, the two professors agreed to expand this method of teaching.

In 1947 a new professor of pathology was appointed. He was equally enthusiastic about the concept of coordination of teaching in the basic medical sciences. Consequently, in 1947-1948 the major portion of the teaching in physiology, pharmacology, physiological chemistry, and pathology was integrated completely. Since then, the faculty in the departments of bacteriology, immunology, and physical anthropology have also joined in this teaching program. The departments remain separate for administrative and research purposes, but cooperate in presenting what has now grown to be a lecture course of seven hours a week throughout the 31-week school year for the 300 to 350 student-physicians in the Graduate School of Medicine.

DESCRIPTION OF PLAN

Our students are physicians training to be specialists in one of 19 fields of medicine or dentistry. They receive a considerable amount of highly detailed training in anatomy, pathology, and physiology related to their specific interests, and, because of this, it is impossible to correlate *all* teaching in such a large graduate school of medicine. However, all physicians, regardless of specialty, are required to acquire a thorough understanding of the body as a whole. This is achieved through the "Correlated Clinical Science Course" of 217 lectures, panel discussions, or case presentations each year. The general arrangement of the schedule is on the organ system basis. Physiology, physiological chemistry, pathology, bacteriology, immunology, pharmacology, and physical anthropology are presented together as they pertain, in turn, to the kidney, circulation, heart, blood, lungs, alimentary tract, liver, gall bladder, pancreas, metabolism and nutrition, nervous system, and physical medicine. In certain instances several lecturers may share an hour, so that physiology, pathology, or chemistry, for example, may be presented in logical sequence.

A detailed plan of the approach to one single organ system is given as an example.

From the Graduate School of Medicine, University of Pennsylvania.

URINARY SYSTEM

1. Anatomy, histology, and embryology of the kidney, with especial emphasis on the glomeruli, tubules, and circulation.
2. Glomerular filtration: factors influencing glomerular filtration; measurement of glomerular filtration in man.
3. Tubular reabsorption: water reabsorption; clinical disorders involving water reabsorption; the posterior pituitary; glucose reabsorption; glucose Tm (maximal tubular reabsorptive capacity); chemical factors involved in glucose reabsorption; reabsorption of sodium and chloride.
4. Tubular excretion: production of acid and ammonia by the kidney; para-aminohippuric acid clearance; drugs excreted by tubules.
5. Renal blood flow: methods for measuring; factors regulating renal blood flow.
6. Clinical examination of the urine: hematuria, albuminuria, and casts.
7. Pathology of the glomeruli and tubules: nephritis, nephrosis, lower nephron ischemia, nephrosclerosis.
8. Correlation of old and new renal function tests with physiological, chemical, and pathological studies in renal disease.
9. Renal insufficiency: uremia; anuria; management of anuria and renal insufficiency; artificial kidney.
10. Acidosis. This includes a presentation of acid-base (ionic) balance in general, renal acidosis, and other types of clinical acidosis; compensatory mechanisms involved in clinical acidosis; treatment of acid-base imbalance; parenteral fluid therapy.
11. Edema: hypoproteinemia; protein deficient states and their management; diuretics.
12. Renal pelvis and ureters: physiology, pharmacology, and pathology.
13. Urinary bladder: physiology; clinical disorders of bladder function; pathology.
14. Infections of the kidney, pelvis, ureters, and bladder.
15. Prostate gland: physiology; endocrinological relationships; hypertrophy, carcinoma, and infection; treatment.
16. Panel discussion. Questions are submitted by the class and answered by the basic science faculty group as a panel. Differences of opinion that arise are debated in a friendly spirit.
17. Case presentation. Selected cases of renal disease are presented by a clinician and discussed by the clinician and the basic science faculty as a group.

ADVANTAGES OF PLAN

The change from the usual method of presenting the basic sciences as separate, unrelated courses, in favor of this integrated course is considered to be a significant step forward in medical education. It has enabled the student physicians to see clearly the integration of the various basic sciences and their correlation with clinical medicine. Student-physicians in anesthesiology, dermatology-syphilology, gastroenterology, general surgery, gynecology-obstetrics, internal medicine, neurology-psychiatry, ophthalmology, oral medicine-periodontia, oral roentgenology, oral surgery, orthodontics, orthopedics, otolaryngology, pediatrics, physical medicine, prosthetics, radiology, and urology have ranked the course each year as among the most popular of all the courses presented in the school. In addition, a number of members of the clinical faculty and their residents, and members of the faculty of the undergraduate medical school, have found it profitable to attend these lectures regularly. The course has also been highly stimulating and rewarding to the basic science faculty members themselves because the success of such a course requires that the faculty in each division attend lectures throughout the first year, an intervals thereafter. Each faculty group has obtain clearer concept of the whole picture and has learne relate its own special field to those of the other me sciences. The outlook of the faculty members has broadened not only in the field of teaching but als research.

EXPANSION OF PLAN

The plan has not yet been carried to its logical pletion. At the moment anatomy is not included, th it is hoped that a rearrangement of schedules may pe the inclusion of lectures on anatomy. The clinical partments are not included now in the plan of integr teaching except insofar as clinicians participate in presentations.

The coordinated program of teaching requires of the faculty's time than the current system of prese courses as a block. This results from the additional ning and from attendance at all lectures, panel dis sions, and case presentations. Correlation of basic sc with clinical teaching would require further participa in ward walks and clinical seminars. Even though total number of hours may not be increased greatly, distribution would probably be such as to reduce the available for concentrated research. The complete gram may lead to the necessity for larger faculty gr to avoid a decrease in research achievement.

APPLICATION TO UNDERGRADUATE EDUCATION

Can such a plan be applied to undergraduate me education? All of us have had extensive experienc undergraduate medical education, and we believe integration of both lectures and laboratory work in basic science courses of the first two years can be acc plished by any faculty genuinely interested in this type of medical education. Integrated teaching migh accomplished by any one of a number of programs. such program might begin directly with consideratio one organ system from all points of view. Another m begin with an introductory portion in which each o departments would present the following material: a omy department, developmental anatomy or embryol microanatomy department, histological structure histochemistry of cells; physiology department, cell physiology; physiological chemistry department, the ture of enzymes, catalysts, and cellular reactions in eral; pharmacology department, modes of action of d on cellular structures; pathology department, the na of abnormal cells and neoplasia; bacteriology departm anatomy, physiology, and chemistry of bacteria; and munology department, antigen-antibody reactions. lowing this introduction, the faculty would prese logical sequence all important information relating to organ system, and then to another, until all systems been discussed. Thus the anatomist would present gross anatomy of the organ system; the microanato its microscopic structure; the physiologist, its no function; the physiological chemist, its chemical pro the pathologist, the disordered structure and func and the bacteriologist, the role of bacteria and infec At this point, some participation by clinicians woul in further correlation. The pharmacologist could then elucidate the effect of drugs on normal and abnormal man.

Laboratory work can be scheduled to integrate with the lectures and conferences. With some organ systems (kidney, for example) an equal amount of laboratory work may be scheduled for anatomy, microanatomy, physiology, chemistry, pathology, pharmacology, and bacteriology; with others, the laboratory work may be largely the responsibility of the anatomy, microanatomy, pharmacology, and physiology staffs (nervous system), or of the chemistry staff (metabolism), or of the physiology, pharmacology, and pathology staffs (cardiovascular system), with less participation of the other departments. Problems of scheduling will arise, but these will not be insurmountable.

Can undergraduate schools go further and correlate all of the basic science and clinical teaching? The concept is an intriguing one, but we feel it will present very serious problems related to scheduling that cannot be solved with the limited laboratory facilities and faculties available.

CONCLUSION

In our opinion, integrated teaching can be successful only if the chief requirements are fulfilled. These are wholehearted enthusiasm on the part of the faculty to participate in this new educational experiment, willingness to ignore small differences of opinion in the interest of harmony and cooperation, and genuine interest in teaching and in the problems of medicine.

TRAINING IN PSYCHOTHERAPY FOR ALL PHYSICIANS

Eugene Ziskind, M.D., Los Angeles

Every physician should be trained in psychotherapy and expect to use it in his practice. This psychotherapy will not be the same as that by a psychiatrist, but rather a psychotherapy modified to the special needs of the particular clinician and his clientele. A training program to supply the required background and techniques can be made universally available. Such a training program was evolved at the Cedars of Lebanon Hospital in Los Angeles. As similar plans are set into operation throughout the country, it would also be possible to cope with the problems of time and money that now impede the physician interested in this more comprehensive medical approach.

UNIVERSAL PSYCHOTHERAPY

There is fairly wide acceptance of the notion that the practitioner should care for the major psychological and sociocultural factors disturbing his patients, but the idea of psychotherapy practiced by all physicians tends to evoke objection from some practitioners and psychiatrists. Nevertheless, that is what grows naturally out of the needs of current medical practice.

It is generally admitted that about one-third of the patients seen by physicians (general and specialist) have primary psychogenic pathological conditions, one-third have primary physiogenic pathological conditions, and the other third have both, really two different illnesses. Inadequate handling of the large segments of the population with psychogenic illness is one of the major problems of modern medicine and is responsible for the flourishing of many healing cults. Inadequate care for psychogenic pathological conditions is responsible for many, if not most, of the failures in medical practice and fosters the development of chronic neuroses and protracted invalidism. It is extremely urgent that psychosomatic illness be checked at the earliest possible moment, and this is the responsibility of the physician who sees the patient first. The physician seeing the earliest stages of symptom formation is in an opportune position to treat these patients successfully. At the initial appearance of the illness, the causative factors are close to the surface and are readily uncovered. When psychogenic factors are of recent onset, the prognosis is relatively good and a cure not difficult to obtain. The prospect of preventing chronic states, many of which are incurable, is an insistent argument for the earliest possible treatment of psychogenic illness.

Emphasis must be placed on the fact that treatment in this first stage of psychogenic illness is not for the psychiatrist to administer, for at this point the great bulk of patients would resent being referred to a psychiatrist. Furthermore, there are not enough psychiatrists, and their services should be reserved for special problems. The early manifestation of psychogenic factors is not only a special area in which the practitioner can function in his own right, but often it is one in which he alone can achieve the best results.

Once the need for caring for the emotional and social causes of illness in medical patients is recognized, the case for universal psychotherapy becomes clear. The former Chief of Staff at the Cedars of Lebanon Hospital, Dr. M. N. Beigelman, foresaw this when he said, "The time has come when medicine must be reoriented, so that instead of there being the two major disciplines of medicine and surgery, there must now be added a third of equal status—psychiatry." This is particularly significant in therapy. Every physician should be trained in psychotherapy as well as medicinal and surgical therapy.

For the skeptical it is essential to observe that all physicians now do practice some psychotherapy, albeit in many instances it is poor or at least can be improved. But inadvertent and sporadic psychotherapy does not meet the needs of patients in an efficacious manner. They

Associate Clinical Professor of Medicine (Psychiatry and N School of Medicine, University of Southern California, and D the Psychiatric Clinic, Cedars of Lebanon Hospital.

may require a more consciously planned psychotherapeutic approach, often with special periods of time set aside for that purpose.

A most important need today is to improve the psychotherapeutic skills of physicians and to assure a more consistent utilization of such skills. Important as it is to convince physicians of the necessity of meeting psychopathological conditions in their patients, it is more essential to demonstrate procedures which are practical and effective. What is now required is a training program for physicians instructing them in the fundamentals of psychopathology, together with diagnostic and therapeutic techniques. Most certainly there should be a teaching of fundamentals to undergraduates. In addition thereto is the fact that for almost a generation to come the greater number of physicians in practice will not be future graduates but, instead, physicians now in practice. Training in medical school must be accompanied, therefore, by a program for graduate physicians, such as the one described herein. The program is being described so that interested physicians can institute similar activities in their hospitals.

TRAINING PROGRAM

In the spring of 1947 a training program was set up in collaboration with the psychiatric department at the Cedars of Lebanon Hospital (a general hospital) for the training of hospital colleagues in psychotherapy. In order to permit practical training which would cut across many of the controversial and confusing aspects of psychiatric theory, it was arranged to have volunteer practitioners examine and treat medical patients with psychogenic problems under the direction and supervision of the staff psychiatrist. Each physician had two to three patients in hourly sessions of therapy once a week. Each week one hour was spent in consultation or supervised observation with a psychiatrist.

Emphasis was placed on practical experiences rather than didactic presentation. In this connection five areas were stressed: (1) fundamentals of psychopathology related to basic origin in conflict, adhering largely to the factual or generally accepted data with avoidance of the controversial and hypothetical; (2) modification of the traditional diagnostic procedure with reorientations in history taking to aid in the eliciting of psychopathological data; (3) a new diagnostic technique—the life history; (4) modification of the traditional therapeutic procedure, with emphasis on the interpretation of psychogenic illness to the patient, and (5) a new therapeutic technique—interview psychotherapy. The acquisition of this background and skill was constantly oriented in the direction of practical expediency. Because the new diagnostic and therapeutic techniques were probably too time consuming to be utilized frequently by the physician, modifications in his usual diagnostic and therapeutic procedure were stressed for routine use. The special techniques would be reserved for special cases and in general served to enhance the physician's background.

Emphasis was placed on brief therapy. This was facilitated by the setting up of objectives for the practitioner which differed from those of the specialist. Insight into the psychogenic origin of symptoms and the uncovering of the current situational or precipitating factors we held to be within the practitioner's sphere. Charac reconstruction and the uncovering of childhood nucle traumas were deemed to be objectives of long-te therapy reserved to the specialist, the psychiatrist. It w emphasized that there was no intent to make psychiatri of the practitioners.

Up to the present 62 graduate physicians and ab 237 senior medical students have gone through the pr gram. Most recently, within the past year, chiefs of t medical outpatient department have decided to incorp rate the program into the regular medical clinics so th all their physicians might partake of this traini although certain practical difficulties have prevented full operation.

The results of the program have included benefits the patient, physician, psychiatrist, and hospital. For t patient, in addition to relief or improvement of sym toms, there has been proper orientation as to the psyc logical origin of his difficulty. These benefits of psych therapy have, at times, been supplemented by t elimination of much unnecessary, wasteful, and ev harmful referral from physician to physician and fr clinic to clinic. For the physician there has occurred increase in his security, a feeling of adequacy in t handling of these patients. Response to a questionna indicated universally that the physician had acqui techniques which permitted him to be at ease with patient. One of our physicians said that he now felt ju fied in charging patients for this type of care. The ph sicians have acquired direct experience in diagnosis a treatment and an increase in their knowledge of fundamentals. To the psychiatrists there have accru sharpened skills as a result of the teaching process, a there has been a better type of case referral from hospi colleagues to the psychiatrists for their specialized tre ment. To the hospital have come the benefits of elimin ing wastes in unnecessary laboratory tests and specia referrals. At one point, for the first time in the history the hospital, the waiting list in the outpatient departm diminished to zero.

The training program fits into the traditional patte by which physicians acquire many practical ski namely, the pattern of work in hospital clinics. As su it can be included in every general hospital. It is p time and open to all, thus having an advantage over po graduate courses, which require physicians to give their practices and which, even then, are scarcely lo enough to permit adequate treatment experience. It further, based on practical experience under supervis and offers the optimum opportunity for acquiring n skills.

The deficiencies of the program are still manife These are, in part, related to the lack of background fundamental psychiatric knowledge but are also, in pa due to the lack of development in the techniques to employed in this area. There is much need for more search on short-term diagnostic and therapeutic te niques. It is of interest that in the four years of operati not a single instance of any major mishap as a result general physicians working in this program has come my attention.

POLICIES FACILITATING UNIVERSAL ADOPTION

Although the program was gratifying to those who participated in it and will be continued at Cedars of Lebanon Hospital, it has been considered an experiment in professional training with universal applicability. Indeed, if the program should be duplicated in most other general hospitals, it would result in psychotherapeutic training for the medical profession as a whole. Experience indicates that it cannot be undertaken full-blown from the start. Even with physicians adequately trained, this type of comprehensive medicine could not be universally applied at the present because of the greater periods of time it requires initially. Until the patient has an appreciation of its value and is willing to pay for it, there will be limits to its general acceptance. Because of these factors, the training still to be acquired, and other resistances, the incorporation of this approach by the profession will be a gradual one, even in any one institution.

To facilitate more general adoption the following recommendations are being pursued at the Cedars of Lebanon Hospital: First, there is need for driving home the realization that the greater initial outlay of time, energy, and expense effects a saving in the long run. The increased physician's fees due to more prolonged examinations and therapeutic interviews in great measure effect a saving by the elimination of random laboratory exploration and specialty consultations and the earlier termination of treatment, with the prevention of chronic illness and its associated unending expense.

Second, there is need to establish a priority among patients so that the patient seen in the early stages, which is the patient most amenable to psychotherapeutic care, receives attention before the chronic or incurable patients. The chronic patients are the ones most readily recognized as needing psychotherapy and selected for it; whereas, the ideal therapeutic patient, who is a young person with fairly well integrated personality and resourcefulness who has had symptoms for only a short period, frequently goes unrecognized and is not treated. The chronic or incurable patients are more likely to discourage the physician, obstruct progress in psychotherapeutic training, and even discredit psychotherapy. Recognition and treatment of patients in the early stage is therefore stressed. Methods for the care of chronic patients with the minimum expenditure of energy should be pursued.

Third, a flexible set of therapeutic objectives, graduated from minimal care upward, should be applied as time and facilities permit. Each physician should be taught to apply the principles and formal techniques of interview psychotherapy, but it must be recognized that he needs to adjust his performance to the limitations of the patient and his circumstances. The problem is to discover procedures, less than ideal, that do not sacrifice essentials and that remain effective. It is possible to work with varying standards or techniques, adjusted not arbitrarily or accidentally but modified to meet specific needs. The program at Cedars of Lebanon Hospital proceeded on the assumption that the patient with psychogenic symptoms is better off if he has one session of psychotherapy than if he has none, and better off still if he has two, three, or more. Fortunately, there are forces within the patient tending to promote recovery from psychogenic stress, just as there are homeostatic factors related to physical or organic stress. Many times all the patient needs is a slight boost, and his own resources will accomplish the remainder of the cure. This is particularly true in the beginning stages of psychopathological conditions. Although psychiatrists of all schools of thought were utilized at Cedars of Lebanon Hospital and techniques of psychotherapy were taught that require more time than the average course of medical treatment, the conviction was reached that brief therapy of a flexible type is the optimum procedure for the nonpsychiatrist.

Fourth, a gradual expansion of the program within the hospital and its clinics should be planned in the hope that concomitantly similar changes will take place in the private practices of the physicians in the program. The general hospital outpatient department represents a good place of beginning. With the supervision of consulting psychiatrists, the program can be undertaken first in a special clinic set up for that purpose. Once a few of the physicians have been trained in such a special clinic, they may help reduce the patient load in the medical outpatient department, so that other staff members can be relieved from excessive patient loads and trained in the new techniques. As measures to segregate chronic patients are perfected and the number of chronic patients is reduced by the use of the new approach, still other physicians may be permitted to enter the program. In this way a gradual infiltration of the medical clinics and then the specialty clinics may be made possible. Inpatient wards may be serviced in a similar fashion.

Although the major theses presented in this paper are three—psychotherapy for all physicians, a training program to make this feasible, and some steps required to make possible the widespread adoption of psychotherapeutic medicine—actually the primary purpose is to report the training program. That program carries with it no commitment as to what the physician should be taught. That may vary with the plans and intentions of physicians in different places. Those not sharing the concept of psychotherapy of Cedars of Lebanon Hospital may be interested in training according to their own concepts. One of the chief merits of the proposed system of training is that it is flexible and adaptable to different needs and different orientations. It is hoped that physicians elsewhere will be stimulated to give it a trial.

Innate Nonsusceptibility to Infection.—Different animal species vary in their resistance to bacterial parasites and toxins. Thus, for example, man is resistant to canine distemper and rinderpest, and the dog and cat do not get measles, poliomyelitis, typhoid fever, and cholera. Sometimes the differences between species are not complete or absolute, as in the above instances, but partial or relative. The mouse is relatively insusceptible to diphtheria toxin—relatively, that is, to the susceptibility of the guinea-pig. The dog and goat are rarely infected with tetanus, and man seldom develops avian tuberculosis. The frog is unaffected by tetanus toxin in the cold, but succumbs on warming. The fowl is naturally immune to anthrax, but on exposure to low temperature contracts the disease and dies.—H. J. Parish, Inherited Immunity, *British Medical Journal*, May, 1951.

INFECTION IN CHRONIC CHOLECYSTITIS

REVIEW OF TWO HUNDRED FIFTY-NINE OPERATIVE CASES WITH PREOPERATIVE AND POSTOPERATIVE DUODENAL DRAINAGE STUDIES

J. Russell Twiss, M.D., R. Franklin Carter, M.D.
and
Benjamin S. Fishman, M.D., New York

The diagnosis of biliary tract infection by nonoperative means remains a practical clinical problem, notwithstanding improvements in diagnostic procedures. The fact that the duodenum is normally sterile and that bacteria of the biliary tract can be obtained with a duodenal tube has been known for many years.[1] Duodenal cultures consistent with those found in the biliary tract at operation can be obtained with an encapsulated duodenal tube.[2] Duodenal cultures, however, are influenced by the presence of free hydrochloric acid in the gastric contents because the free acid apparently has an inhibiting effect on the growth of bacteria in the stomach, duodenum and bile.[3]

Cultures of the liver may be positive for pathogenic organisms in the normal person because some bacteria transmitted by the blood stream to the liver to be destroyed may survive. These are excreted into the bi
ducts. There, however, they rarely produce patholog
changes or symptoms, except in the presence of obstru
tion.[4] The reported incidence of biliary tract infectio
(as shown by cultures taken at operation) varies co
siderably.[5]

During recent years most investigators report tl
gallbladder to be sterile in about two-thirds of all typ
of cholecystitis.[6] The bacteria most commonly four
are the Escherichia coli and Salmonella typhosa, an
at times various streptococci, staphylococci and othe
types of organisms.[7] In the absence of pathogenic o
ganisms, changes of an inflammatory nature have bee
found in the biliary tract. Alvarez [6g] and Rehfuss [5c] b
lieve that infections occur intermittently, and that cultur
taken in an inactive period are sterile. These patholog
changes, however, may be the result of mechanical
chemical irritations, such as those thought to be due
an excessive concentration of bile,[8] or the presence
activated pancreatic ferments.[9] Allergic reactions m
result in similar inflammatory changes.[5c]

The progressive character of pathologic changes se
ondary to the biliary tract infection that begins in tl
gallbladder and extends to the bile ducts and liver h
been stressed by Russell, Carter, and Oppenheim [10] a
many others.[11] An excellent review of the known fac
is given by Hobson and Rice-Oxley,[5c] who stress tl
need of early recognition of the preliminary stages of tl
generalized biliary tract disease, which they term "chc
angiohepatitis." Early cholecystectomy, when done b
fore the infection extends beyond the gallbladder, w
in most cases effect a cure. Delayed operation, on tl
other hand, is more difficult, is accompanied by a high
morbidity and mortality and has considerably less chan
of a complete cure. These authors make the followi
statement:

> The only indubitable evidence of cholangiohepatitis is in t
> isolation of E. coli or other organisms, either at the time
> operation or by duodenal aspiration, before or after operati
> Duodenal intubation is an invaluable aid in diagnosis and mo
> over can provide evidence of the success or failure of surgi
> or bacteriologic therapy.

The present investigation deals with the incidence
biliary tract infection as determined by operative c
tures, and with cultures of duodenal bile obtained befo
and after cholecystectomy, as well as with the concon
tant pathologic changes of the biliary tract found
operation. The material presented is from a series of 2
patients with chronic cholecystitis operated on in tl
combined medical and surgical biliary tract clinic
University Hospital during the past 20 years. An effo
has been made to determine the role of bacterial infe

This work has been aided by a grant from the Oliver Rea Fund.

Dr. James E. Ziegler, Jr., and his associates in the Department of Microbiology assisted substantially in the preparation of this report.

tion in the production of stones and other pathologic conditions. The preoperative diagnostic work-up in 156 cases included a duodenal drainage with cultures of duodenal bile; similar duodenal drainages were done for 113 patients after cholecystectomy.

The purpose of the duodenal drainage studies was (1) to ascertain the accuracy with which bacterial infection of the biliary tract could be determined preoperatively with methods now in use; (2) to demonstrate significant changes in the flora of the duodenal bile that might occur as the result of cholecystectomy. These drainages were done with the Twiss duodenal tube,[12] with the sterile precautions of a modified Lyon technic described elsewhere.[1g]

The accuracy of the bacteriologic findings in this series of patients may be compared with a series of 120 operative patients previously reported by Twiss, Carter and Hotz,[2c] in which the preoperative duodenal drainages were performed with a Twiss duodenal tube with the bucket covered by a keratin-coated capsule. In this series 75 patients were found to have all specimens of duodenal bile sterile preoperatively. Seventy-four of this group were sterile in all parts of the biliary tract at operation. Of 28 patients having one or two pathogenic types of organisms preoperatively, 25 showed the same types in the specimens obtained at operation.

DIAGNOSTIC INVESTIGATION

In this investigation those patients with negative cultures at operation were classified as sterile. Those having one or more positive cultures at operation were included in the infected group. A cholecystogram of practically all patients not having jaundice was obtained. For those having duodenal drainages, the free hydrochloric acid, the presence or absence of concentrated gallbladder bile, and the results of cultures of bile taken under sterile precautions were recorded. "D" specimens were duodenal bile obtained before stimulation, "M" and "O" were specimens of bile obtained after the installation of magnesium sulfate and olive oil. The results presented are those of the departments of roentgenology, pathology and bacteriology.

STATISTICAL ANALYSIS

Of the 259 patients, there were 203 women and 56 men. All operative cultures were sterile in 186, or 72%, of the patients; pathogenic organisms were found in 28%. The average age of the infected group was 47 years, that of the sterile group 2.5 years less.

The average duration of symptoms was 42 months in the infected group and 56 months in the sterile group. The presence of infection did not seem to alter the character or severity of symptoms, since each group had a similar incidence of pain, nausea and vomiting, loss of weight, and chills and fever. Jaundice, however, occurred in 24% of the infected group and in 6% of the sterile group. One apparent reason for this was the more advanced pathology in the infected group. Cholelithiasis was found in 83% of the patients in both groups.

The incidence of tenderness and enlargement of the liver was the same in both the sterile and infected groups, while anemia and loss of weight were more common in the infected group. Fever was an infrequent complaint. Symptoms apparently resulted from factors such as stones and obstruction rather than infection.

A review of the cholecystograms of 196 patients showed similar findings in the sterile and infected groups. Normal visualization was reported in 24% of each group, with delayed emptying in 10% of each. Impaired or absent visualization was reported in 76% of each group. No visualization, however, was reported in 30% of the infected patients and in only 17% of the sterile patients. These findings suggest a higher incidence of cystic duct obstruction in the infected group. In a detailed review of the cholecystograms of 156 patients, there were 18, or 11%, yielding normal visualization without evidence of stones. Stones were visualized in 124. There was normal visualization of the gallbladder in 50 and faint or no visualization in 74.

OPERATIVE FINDINGS

The relative proportion of sterile and positive bacteriologic findings at operation are shown in Table 1. All parts of the biliary tract were sterile in 186 of the 259 patients; the total number of sterile cultures of each specimen is shown; some part of the biliary tract was found to harbor pathogenic organisms in 73, or 28%. (The proportion of pathogenic cultures of the gallbladder bile was 22%, the gallbladder wall 25%, gallstones 17%.) Gallstones were present in 83% of both groups. The statistics do not suggest that stones could be considered either a primary cause or effect of infection.

EFFECT OF INFECTION

An analysis of the operative and pathologic diagnoses of the 259 patients showed that subacute cholecystitis was reported only in the sterile group, with one exception. Pericholecystitis was found in both groups (Table 2).

TABLE 1.—*Sterile and Infected Bacteriologic Findings at Operation Among 259 Patients*

	Patients with Sterile Cultures	Patients with Infected Cultures	Patients Infected, %
Conditions yielding cultures	186	73	28
Gallbladder bile	174	64	22
Gallbladder wall	171	57	25
Gallstones	125	25	17
Common duct bile	30	18	37
Cystic duct node	31	13	30

Complications involving the liver and spleen occurred with about the same frequency in both groups. The only organ that showed an increased morbidity in the infected group was the pancreas. Ten cases of acute and chronic pancreatitis were found in the infected group, with only five cases of chronic pancreatitis in the larger sterile group. Duodenal ulcer and periduodenitis were found only in the sterile group.

PATHOLOGIC FINDINGS

A brief summary of significant findings reported by the pathologist on gross and microscopic examinations of the removed gallbladders is shown in Table 3. The incidence of practically all findings is similar in both groups. Cholesterosis of the gallbladder occurred more frequently in the sterile group; necrosis, more frequently in the infected group. The low incidence of polymorphonuclear infiltration in both groups is worthy of note.

FINDINGS IN PATIENTS STERILE AT OPERATION

Preoperative Duodenal Drainage Findings.—The results of the preoperative duodenal drainages of 100 patients sterile in all parts of the biliary tract at operation are shown in Table 4. The findings are recorded on the basis of the presence or absence of free hydrochloric acid in the gastric contents. In the presence of free hydrochloric acid, 73% of the patients had all sterile cultures; with no acid, only 46% were sterile. When drainages with one or two sterile specimens of duodenal bile were added to those having all sterile specimens, 85% of those with acid showed sterile cultures, while only 61% of those without acid were sterile.

TABLE 2.—*Associated Conditions Indicated by Operative and Pathologic Diagnoses*

	Sterile	Infected
Associated Conditions	186	73
Cholecystitis, chronic	171 (92%)	70 (96%)
Cholecystitis, subacute	8	1
Pericholecystitis	11 (10%)	2 (4%)
Pancreatitis, chronic	5	6
Pancreatitis, acute	0 (2%)	4 (13%)
Hepatitis	10	3
Cirrhosis of the liver	3 (9%)	2 (7%)
Splenomegaly	5	0
Appendicitis, chronic	85 (46%)	36 (50%)
Appendicitis, acute	1	1
Duodenal ulcer	5	0
Periduodenitis	1	0

The types of organisms found where part of the cultures were sterile are shown in Table 5. Mixed growths or nonpathogenic types of organisms predominated. Significantly enough all positive cultures of bile occurred in the "D" or "M" specimens; the final or "O" specimens were all sterile. Contaminations seemed less prevalent in the final specimens of duodenal bile. The organisms found when all cultures of duodenal bile were positive are also shown in Table 5. The proportion of these apparently contaminated drainages was 16% in the presence of free hydrochloric acid and 36% in its absence. In the achlorhydria group, mixed growths of organisms again predominated. These findings clearly indicate the relation of the absence of free hydrochloric acid in the stomach and pathogenic organisms in the duodenum. A mixed growth of organisms in the duodenal bile suggests gastric or duodenal contamination, especially if the positive cultures occur only in the "D" or "M" specimens.

Postoperative Findings in Patients with Sterile Preoperative Cultures.—Sterile postoperative duodenal drainages were done over a period of four years in 50 patients having all preoperative and operative specimens sterile. Of the 30 having no free acid postoperatively, 27 had drainage during the first year. Twenty-two of the 27 drainages showed sterile specimens, and five had only positive cultures. The types of bacteria found then and during the subsequent years were mixed cultures, E. coli and nonhemolytic streptococci. Of the 20 patients having free acid, only one had a positive postoperative bile culture of Staphylococcus aureus. Apparently a sterile biliary tract will remain sterile in the presence of free hydrochloric acid. With no free acid, however, positive cultures are far more prevalent. These findings may be attributed to an increased incidence of contamination from the stomach or intestines, an intermittent discharge of bacteria from the biliary tract, or a cholangitis which developed after the cholecystectomy.

TABLE 3.—*Significant Findings in Examinations of Removed Gallbladders*

	Sterile	Infected
	186	73
Gross examination		
Hemorrhage	9	2
Cholesterosis	13 (7%)	1 (1%)

Mononuclear cells	13	4
Eosinophils	5	2
Collagen degeneration	4	3
Necrosis	2 (1%)	3 (4%)
Giant cells	1	0
Calcification	1	0

Postoperative Findings in Patients with Positive Preoperative Cultures.—A postoperative study of duodenal drainage bile was made of 23 patients sterile at operation, in whom pathogenic organisms were found in the duodenal bile preoperatively, to determine whether the same types of organisms were present after cholecystectomy.

Of six patients with free acid, three with preoperative cultures of E. coli showed E. coli in each case after one, three and 11 years. Of the remaining three patients, one had preoperatively a nonhemolytic Streptococcus and postoperatively a mixed growth of organisms during the first and second years. Of the remaining two, one had before operation a K. pneumoniae (Friedländer's bacillus) and one a Staph. albus; each was sterile postoperatively over a period of three years. These findings suggest a transient intermittent discharge of bacteria in the duodenal bile, as opposed to the chronic infection with positive cultures at operation.

In the 17 patients having no free acid, 10 had preoperatively a mixed growth of bacteria. Of these, nine had duodenal drainages during the first postoperative year; six had persistent mixed growths, three had a persistent single type of organism. During the second postoperative year, four of this group of 10 had duodenal drainages; there were two mixed growths, and two had a single type of organism. During the third and fourth years, three patients had drainages and each showed a mixed growth of organisms. Of four patients having E. coli preoperatively, all showed postoperatively E. coli or coli with other types of organisms over a period of three years. Sterile cultures were obtained postoperatively in only two of the 17 patients with no free hydrochloric acid. In each of these the preoperative organism was K. pneumoniae (Friedländer's bacillus). Here again, the consistent preoperative and postoperative findings indicated an intermittent discharge of the same types of organisms into the duodenum.

TABLE 4.—*Sterile Duodenal Drainage Culture Findings in 100 Preoperative Patients*

Number of Drainages		All Sterile Specimens	One or Two Sterile Specimens
In patients with free HCl.........	48	35 (73%)	6
In patients without free HCl.....	52	24 (46%)	8
Total	100	59	14

FINDINGS IN PATIENTS WITH POSITIVE CULTURES AT OPERATION

Operative Findings.—Table 6 summarizes the bacteriologic culture reports of the specimens obtained at operation in the 83 patients of the infected group, in each of whom there was at least one positive culture of a pathogenic organism. A number of cultures from the biliary tract were sterile. The most prevalent organism found was E. coli. Other organisms found in significant numbers included nonhemolytic Streptococcus, S. typhosa, and alpha (green) hemolytic Streptococcus, and Clostridium perfringens (Welch's bacillus). It is of interest to note that in this infected group, 21 of the 52 stones cultured were sterile. Cultures of the common duct bile were positive in 24 of the 25 specimens examined, while the cystic duct node cultures were positive in 17 of 18 specimens. It would seem that infections of the gallbladder involve the common duct and cystic duct node more frequently than the contained stones.

Preoperative Culture.—A study was made of the preoperative duodenal drainages in 49 patients having positive cultures of the biliary tract at operation. Of the 34 patients in this group having no free acid, 28 had at operation a single type of organism, six had more than one type (Table 7). In the preoperative duodenal drainages 14 of the 28 had only the same type of organism, while five had the same with an additional type. Preoperatively, seven patients had types of organisms different from those found at operation, while two were sterile. Of the six patients having more than one type of organism at operation, all had at least one of these types in the preoperative duodenal drainage bile.

TABLE 5.—*Organisms Found in Preoperative Duodenal Drainages*

Organism	Number in Patients With Free HCl	Number in Patients Without Free HCl
Sterile "O" Bile with Positive "D" or "M" Specimens		
Mixed growth	3	6
Micrococcus catarrhalis	1	0
Nonhemolytic Streptococcus	1	0
Klebsiella pneumoniae	1	1
Staphylococcus albus	0	1
Total	6 (12%)	8 (15%)
No Sterile Cultures		
Mixed growth	3	14
Nonhemolytic Streptococcus	2	0
Streptococcus viridans	1	0
Staphylococcus albus	1	0
Gram-negative rods	1	0
Escherichia coli	0	4
Gram-positive cocci	0	1
Total	8 (16%)	19 (36%)

The bacteriologic findings in the 15 patients having free acid are also shown in Table 7. Of the 15, nine showed the same type of organism in the duodenal drainage bile as that found at operation. The duodenal bile was sterile in four patients and in two a type of organism different from that in the biliary tract at the time of operation was shown. In summary, 43, or 87%, of the patients showed pathogenic types of organisms in the duodenal drainage bile. All patients having sterile preoperative cultures of duodenal bile had sterile cultures of gallbladder bile at operation.

TABLE 6.—*Types of Organisms in Operative Specimens of 73 Patients with Pathogenic Organisms in the Biliary Tract*

	Total	Sterile	Escherichia coli	*Salmonella typhosa*	Nonhemolytic Streptococcus	2 Types of Organisms	Alpha Hemolytic *Streptococcus*	Clostridium perfringens	Proteus vulgaris	Staphylococcus albus	Gram-negative rods	Alcaligenes faecalis	Staphylococcus aureus

Postoperative Cultures.—In 40 patients having positive cultures of the biliary tract at operation, the effect of cholecystect [illegible] on the bacteriology of the duodenal bile was [illegible] inages over a period

Of the various types of infection, only in S. typhosa was there a tendency for the duodenal bile to become sterile, regardless of the presence or absence of free acid. Of 11 typhoid carriers (seven with free acid and four without acid), nine had sterile cultures of duodenal bile within a year; in one the bile became sterile later.

In the remaining 29 patients, 18 without free acid showed persistently positive cultures of duodenal bile in most instances. In this group, of the six having E. coli at operation, the duodenal bile became sterile in three, and in three the E. coli was retained, two of these having an additional type of organism.

Of the 11 patients with free acid, five who had single types of E. coli or nonhemolytic streptococci at operation had sterile duodenal bile. The remaining six had two types of organisms at operation. All these patients continued to have positive cultures of the same or similar types in the duodenal bile.

COMMENT

The role of infection in chronic cholecystitis is of fundamental importance in that a chronic infection apparently becomes permanent once it has extended beyond the gallbladder and becomes established in the walls of the bile ducts. While the majority of patients coming to operation do not show evidence of active infection, the presence of such an infection frequently constitutes a serious problem even after operation.

The recognition of such a condition before involvement of the bile ducts and liver is obviously to the best interest of the patient, surgeon and internist. Active infection of the biliary tract can be determined reliably by cultures of duodenal bile taken under sterile precautions provided there is good drainage technic and accurate laboratory work.

At operation, the majority of organisms found are in the colon-typhoid and streptococci groups. In most cases the presence of these bacteria in the duodenal bile (as shown by comparative studies of the preoperative and operative cultures in this series) constitutes dependable evidence of biliary tract infection.

However, the presence of organisms in the duodenal bile, other than those of the above-stated groups, cannot always be considered of diagnostic value, particularly if several types are present, or if there is no free hydrochloric acid in the gastric contents. The accuracy of the cultures of duodenal bile should be questioned if they are not consistent with the history, physical findings and cholecystographic findings.

The procedure of duodenal drainage has lent itself particularly well to the investigation of patients with a residual typhoid infection of the gallbladder, in whom the diagnosis of the typhoid carrier state by duodenal bile cultures and its elimination by cholecystectomy have been in most cases successful.[13] The elimination of the more prevalent colon carrier state is decidedly less satisfactory. The cause of the unsatisfactory results in many of these patients is that the nature of the infection has not been recognized until after it has spread beyond the gallbladder and become "seeded" in the bile ducts, after which cholecystectomy is unsuccessful in clearing up the condition. The earlier recognition of active biliary tract infection by means of duodenal drainage cultures should lower the incidence of delayed cholecystectomy, which in these cases results in a persistent chronic infection of the bile ducts, with increased operative mortality and increased morbidity.

SUMMARY AND CONCLUSIONS

1. A study has been made of 259 patients with chronic cholecystitis coming to operation. Preoperative and postoperative cultures of the duodenal bile were obtained, as well as cultures from all parts of the biliary tract at operation. Operative cultures were positive in 73, or 28%, of the patients, and were sterile in all parts of the biliary tract in 186, or 72% of the patients.

2. The sterile and infected groups had a similar incidence of symptoms and abnormal physical findings, as well as the same percentages of abnormal cholecystograms.

3. Gross and microscopic pathologic examinations showed no significant differences in the sterile and infected groups.

4. In the group of 186 patients sterile in all parts of the biliary tract at operation, the results of preoperative duodenal drainages in 100 patients gave one or more sterile cultures in 85% of those with free hydrochloric acid and in 61% of those having no free acid. Fifty patients with sterile preoperative cultures, practically all having free acid, remained sterile postoperatively. Of 32 patients having no free hydrochloric acid, 10 showed only postoperative positive cultures of duodenal bile.

---

[13] Garbat.[1b] Wilkie.[6c] Coller, F. A., and Crabtree, P.: Chronic iary Typhoid Carriers, Surgery 12:426, 1942. Hanssen, E.: The Status of the Typhoid Carrier Problem, New York State J. Med. 7, 1939.

5. In the group of 73 patients with pathogenic organisms in the biliary tract at operation, the predominating organisms were Escherichia coli, Salmonella typhosa, nonhemolytic Streptococcus, alpha hemolytic Streptococcus (green), Klebsiella pneumoniae (Friedländer's bacillus), and Proteus vulgaris. Stones were positive in 31 of 52 cases, the common duct bile and cystic node cultures were positive in all but one case each. Eighty-seven percent of 73 preoperative duodenal drainages showed pathogenic organisms. The six patients having sterile preoperative cultures had sterile gallbladder bile at operation. Postoperative drainages showed sterile cultures of duodenal bile in 10 out of 11 typhoid carriers and in all patients having free acid with pure colon or Streptococcus infections. In the majority of the patients having no free acid and in those having acid with mixed cultures at operation, the duodenal bile remained positive.

6. In both the sterile and the infected groups, there were the same incidence and type of pathologic changes and stones, suggesting that infection was superimposed upon previously existing pathologic conditions.

7. The presence of active infection, however, makes the condition of the patient far more serious. Infectious cholecystitis can be cured only if treated in the early stages by cholecystectomy.

8. The early recognition of biliary tract infection is for the most part dependent upon the demonstration of pathogenic organisms in the duodenal bile. With suitable sterile precautions this can be done accurately in the majority of patients.

65 E. 55th St. (Dr. Twiss)

VISUAL SYMPTOMS AFTER DIGITOXIN THERAPY

Maxwell L. Gelfand, M.D., New York

The demonstration by Travell and Gold[1] that digitoxin is almost completely absorbed from the gastrointestinal tract in man has led to an ever-increasing popularity in the use of this digitalis glycoside. Many physicians are now employing digitoxin ("digitaline Nativelle," purodigin®, and crystodigin) in preference to digitalis leaf in congestive failure and arrhythmias requiring digitalis therapy. Although Gold and his co-workers[2] have emphasized that the full oral digitalizing dose of 1.2 mg. and the maintenance dose of 0.2 mg. can be given with safety, several reports of digitoxin toxicity have recently appeared in the literature.[3]

Ocular symptoms associated with digitalis poisoning have long been known to the medical profession. Recently, eye symptoms have also been described resulting from the ingestion of digitoxin, but these were associated with more serious cardiac abnormalities. The following four cases illustrate visual disorders arising shortly after digitoxin therapy with no other evidence of toxicity.

REPORT OF CASES

CASE 1.—S. O., a 69-yr.-old white man, complained of cough, dyspnea on exertion, and slight ankle edema of five days' duration when seen on Jan. 5, 1949. The past history disclosed that he had sustained two attacks of coronary occlusion, in 1936 and 1942. He recovered completely and was able to perform his work, dress cutting, until this present episode.

Physical examination at this time revealed dyspnea and orthopnea but no cyanosis. The weight was 187 lb. (84.8 kg.). The heart was markedly enlarged to the left on percussion and the apical impulse was palpable in the sixth interspace at the anterior axillary line. A systolic murmur was heard at the apex and base, and the second aortic sound was accentuated. The rhythm was regular and the blood pressure was 120/80. There were many moist rales at both bases of the lungs. The liver was enlarged three fingerbreadths below the costal margin and there was 1 + pretibial edema. The electrocardiogram was interpreted as showing an old anterior wall infarct, left axis deviation and a transverse heart. There was no history of digitalis therapy; therefore, 0.4 mg. of "digitaline Nativelle" was given at once, followed by 0.4 mg. every six hours until a total of 1.2 mg. was reached. Thereafter, a daily maintenance dose of 0.2 mg. was employed. In addition, bed rest and a salt-free diet were prescribed. Two weeks later the patient complained of slight blurring of vision. He stated that he saw bright flickering lights, and that objects were covered with snow when he was outdoors in the daylight. He was referred to an ophthalmologist, who, after a complete examination failed to discover any abnormal findings. It was suggested that the digitoxin was responsible for the ocular disturbances. An electrocardiogram at this time indicated depression of the ST segment and inverted T waves in leads 2 and 3. No rhythm or conduction abnormalities were noted. Cessation of digitoxin for several days succeeded in clearing these symptoms. "Digitaline Nativelle" was then readministered in a 0.1 mg. daily dose with no ill effects.

CASE 2.—M. B., a 70-yr.-old white man with hypertensive and arteriosclerotic heart disease and emphysema, had been on digitalis leaf therapy for several years with no untoward effects. On Feb. 7, 1949, he complained of marked dyspnea, orthopnea, cough and swelling of the ankles. He had not taken digitalis for six months.

On physical examination the heart was enlarged to the left on percussion. There was a systolic murmur at the base, and the second aortic sound was greater than the second pulmonic sound. The rhythm was regular and the blood pressure was 170/110. The lungs were hyper-resonant to percussion and numerous rhonchi, wheezing and sonorous rales were heard throughout both lung fields. The liver was felt four fingerbreadths below the costal margin, and there was 2 + pretibial edema. The weight was 202 lb. (91.6 kg.). The electrocardiogram demonstrated right axis deviation with a pattern suggestive of right ventricular hypertrophy. The patient was given 1 cc. of meralluride injection (mercuhydrin®) subcutaneously, and 1.2 mg. of purodigen® was prescribed in three divided doses of 0.4 mg. every six hours, followed by a maintenance dose of 0.2 mg.

Med. **8**: 640, 1950.

daily. Ten days later, when the patient was seen again, marked improvement of the congestive failure was noted. On careful questioning, however, he complained that he had white spots before his eyes and blurring of vision, and that objects were covered with snow when he was outdoors in the daylight. In addition, there were loss of appetite and nausea but no vomiting. Digitoxin intoxication was suspected immediately and the drug was stopped. An electrocardiogram at this time revealed depression of the ST segment and inversion of the T waves in leads 1, 2, and 3. Several days later, 0.1 mg. of purodigen® was readministered without return of the above symptoms. On several occasions when the dose was increased spots before the eyes reappeared.

Case 3.—Mrs. B. S., a 72-yr.-old white woman, was admitted to Manhattan General Hospital on Nov. 15, 1949, with a diagnosis of hypertensive and arteriosclerotic heart disease in marked congestive failure. She had omitted taking digitalis for several months. Her weight was 178 lb. (80.7 kg.). On admission, 1.2 mg. of "digitaline Nativelle" was administered at once, followed by a maintenance dose of 0.2 mg. daily. In addition, oxygen, a salt-free diet, and meralluride injection every other day were given. Six days later the patient complained of blurred vision and yellow spots before her eyes. An electrocardiogram taken at this time did not reveal any changes from those noted on admission and was interpreted as indicative of left ventricular strain. Immediately, digitoxin was stopped and four days later these visual symptoms disappeared. A dose of 0.1 mg. daily was reinstituted and well tolerated.

Case 4.—Mrs. M. F., a 78-yr.-old white woman, was admitted to the Manhattan General Hospital on May 15, 1950, in marked congestive failure.

Physical examination revealed marked cyanosis, dyspnea and orthopnea. There was distention of the vessels of the neck. Cardiac dullness was markedly enlarged to the left on percussion. The rate was rapid and the rhythm was regular. There was a rough musical systolic murmur over the entire precordium, and the second pulmonic sound was accentuated. The blood pressure was 210/130. There were many rhonchi, wheezes, and numerous sibilant and moist rales throughout both lung fields. liver was palpable at the level of the umbilicus and was ely tender. The extremities revealed 3 + edema. The ight was 210 lb. (95.2 kg.). An electrocardiogram, taken on May 16, 1950, revealed left bundle-branch block. Since there was no history of any recent digitalis therapy, 1.2 mg. of "digitaline Nativelle" was given at once, followed by 0.2 mg. daily. In addition, aminophylline and the Karell diet were prescribed. Four days later, on careful questioning, the patient complained of loss of appetite, nausea, blurred vision, yellow vision, and scotoma. An electrocardiogram at this time did not indicate any cardiac abnormalities other than those noted on admission. Cessation of the digitoxin for five days resulted in clearing of the above symptoms. A subsequent dose of 0.1 mg. daily was then given with no untoward effects.

COMMENT

Congestive heart failure, regardless of its etiology, is the primary indication for digitalis therapy. Inasmuch as in all the cases presented the patients were in failure, there can be no question as to the need for the use of a digitalis compound. The dosage of 1.2 mg., either as an initial digitalizing dose or in divided doses given every six hours, is in accord with schedule suggested by Gold and others.[2] This cannot be considered an excessive amount since all the patients weighed more than 70 kg. The daily maintenance dose of 0.2 mg. is somewhat controversial. Although Gold and his associates recommended a daily maintenance dose of 0.2 mg., they felt that this was the average dose and it did not apply to all cases. Batterman and DeGraff[4] stated that a daily maintenance dose of 0.2 mg. carried with it a higher incidence of toxicity than a 0.1 mg. daily quota; hence, they recommended the latter. It is possible that the higher maintenance dose employed in this group of patients may have been responsible for the toxic symptoms, since digitoxin is known to have a cumulative effect.

Ophthalmic complaints resulting from digitalis intoxication were noted as early as 1785, when Withering, in his classic paper on the foxglove, stated that when given in large doses it might result in "confused vision—objects appearing green or yellow." In 1925, Sprague, White and Kellogg,[5] in an exhaustive review of the subject, found few references in the English literature, but many reports in German and French. They described seven of their own cases and concluded that the character of the visual disturbance was related to the individual susceptibility of the patient and the dosage of the drug. Since then physicians have become alerted to this phenomenon. Not infrequently ophthalmologists are the first to see patients with visual complaints while under treatment with digitalis. Thus Carroll,[6] Langdon and Mulberger,[7] and Gillette[8] reported several patients with eye symptoms resulting from the ingestion of digitalis. In their cases the visual acuity, visual fields and fundi were completely normal. However, Wagener, Smith and Nickeson[9] described a case of blurred vision and retrobulbar neuritis with bilateral central scotomatous defects in the field of vision after digitalis therapy.

A variety of ocular abnormalities have been described associated with digitalis poisoning.[10] Blurring of vision, white vision, and disturbances in color vision, so that objects appear yellow, green, blue and red, are the most common. The effect is often increased by going out into the sunlight, although some have stated that artificial light also produces the colored vision. Cases have been recorded in which the surroundings were said to have appeared covered with snow or hoary frost. Dimness of vision with inability to distinguish objects or people, inability to focus the eyes and to read even the largest print have occasionally been mentioned. Many forms of light sensation and scotoma have also been described. These have ranged from flickering before the eyes to flashes of light, rapidly moving sparks and spots of various colors surrounded by coronas and banded figures. Rarely, diplopia and temporary as well as permanent amblyopia have been reported. Among the objective findings noted with the above symptoms were mild conjunctivitis, pupillary variations, exophthalmus, retro bulbar neuritis and possible nystagmus. Although n satisfactory explanation for these manifestations is available as yet, most investigators believe that they are du to a toxic action of digitalis on the central nervou system.

10. Sprague, White and Kellogg.[5] Willius, F. A.: Digitalis Intoxication, Mod. Concepts of Cardiovas. Dis. **14**: 12 (Dec.) 1945.

Blurred vision, white and yellow vision, scotoma, the appearance of bright flickering lights and the appearance of snow covering objects outdoors were the visual disturbances observed in these patients following the ingestion of "digitaline Nativelle" and purodigen®. They were no different from those described as a result of digitalis toxicity. This is not surprising, since there is sufficient experimental evidence to indicate that the only fraction of digitalis that is absorbed is the digitoxin or digitoxin-like material. Batterman and DeGraff,[4] and Gold,[11] as well as others, have shown that the toxic manifestations of the purified glycosides are generally the same as those of digitalis leaf. Master [3a] observed that the symptoms in his cases of digitoxin poisoning were no different from those described as a result of poisoning with other types of digitalis. The eye symptoms in this group of patients developed early in the course of digitoxin therapy, and cleared several days after the drug was withdrawn. Subsequently, the readministration of smaller doses produced no ill effects on the eyes, thus precluding a hypersensitivity factor.

The slight nausea and loss of appetite in Cases 2 and 4 may have been due either to the congestive failure per se or possibly to digitoxin overdosage. The depression of the ST segments and inverted T waves noted in the electrocardiograms of Cases 1 and 2 at about the same time that the visual disturbances appeared cannot, by themselves, be considered as evidence of digitoxin toxicity. They are an indication of the physiologic effect of digitoxin on the cardiac musculature. In none of the patients were rhythm or conduction abnormalities detected either clinically or electrocardiographically concurrent with the eye symptoms. This is somewhat different from the observation of others. Most of the recent reports relative to digitoxin intoxication have emphasized the serious disturbance of the cardiac mechanism. Visual disturbances have been mentioned, but always in association with cardiac disorders and other systemic involvement.

It is thus apparent from the cases presented here that ocular aberrations can occur soon after the ingestion of digitoxin and, when present, indicate early toxicity. It is probable that the prompt recognition of these visual disturbances may obviate more serious cardiac sequelae. Therefore, it is important to question patients early in the course of digitoxin therapy as to whether they have had any visual disturbances.

SUMMARY

Four patients in congestive failure were treated with digitoxin ("digitaline Nativelle" and purodigen®) orally.

A full digitalizing dose of 1.2 mg. and a maintenance dose of 0.2 mg. was employed.

Blurring of vision, white and yellow vision, scotoma, bright flickering lights and objects covered with snow, outdoors only, were the visual symptoms of toxicity noted in the patients.

The visual complaints developed early in the course of digitoxin therapy, from the fourth to the 12th day.

Cessation of administration of the drug for several days cleared the ocular disturbances, and the reintroduction of a smaller maintenance dose produced no ill effects on the vision.

No disturbances of the cardiac mechanism were noted in this group of patients with digitoxin toxicity.

It is suggested that patients on digitoxin therapy should be observed for visual symptoms.

CLINICAL NOTES

INCOMPATIBILITY OF LUMBAR BLOCK AND ANTICOAGULANT THERAPY

Frank Cole, M.D.
and
William P. Kleitsch, M.D., Lincoln, Neb.

Temporary paralysis of the lumbar sympathetic ganglions by means of a paravertebral injection of procaine hydrochloride is enjoying a well-earned measure of popularity both as a therapeutic test and as a means of treatment. Paravertebral blocks are commonly used to determine the degree of vasospasm in the legs and, thus, to discover how much relief can be expected from lumbar sympathectomy. Paravertebral block is almost a specific treatment for femoral thrombophlebitis (milk-leg).

It is important to note, however, that the indications for paravertebral sympathetic block often coincide with the indications for anticoagulant therapy. This is an important item to consider because, while the indications for use of paravertebral procaine injections may coincide with the indications for anticoagulant therapy, the simultaneous use of these procedures is fraught with great danger. In other words, paravertebral blocks should never be done in patients who are receiving anticoagulant therapy. This conflict in therapeutic agents has been noted by others, who have suggested that deep injections of any kind are best avoided in patients whose clotting mechanism is impaired.[1] The most dangerous deep injections are paravertebral and intraspinal, since both pass through vascular tissues and in either case subsequent hemorrhage may be a serious complication.

Perforation of a lumbar vein is an unavoidable and not infrequent occurrence in paravertebral injections. When the clotting mechanism is intact, such a needle puncture will produce little harm, since it will soon be sealed with a clot. When clot formation is impaired, continuous oozing may occur. The amount of blood extravasated into the retroperitoneal tissues may indeed

assume massive proportions without being suspected. A lower-abdominal mass, intestinal distention, ileus, fever, and falling erythrocyte count all may indicate a retroperitoneal hematoma. When this complication occurs, the clotting mechanism must be restored by administering vitamin K to combat bishydroxycoumarin (dicumarol®) poisoning and protamine to counteract heparin. Supportive blood transfusions are also indicated. Finally, operative drainage of the hematoma is desirable.

REPORT OF A CASE

R. B., a 54-yr.-old white man, sustained a fracture of the right lower leg in an automobile accident on April 4, 1950. The fractures were treated by means of pinning and a cast, and bishydroxycoumarin was administered from April 20 to May 2. He was discharged on convalescent furlough on May 14 and readmitted on June 21, when the cast was changed and the pins were removed. On June 29 a tender lymph node was palpable in the right inguinal region, and, later, evidence of thrombophlebitis was discovered. He was given 300 mg. of bishydroxycoumarin on July 10, 200 mg. on July 11, and 50 to 100 mg. daily thereafter, in order to maintain the prothrombin time approximately double that of the control. No difficulty was encountered until July 28, when attempts were made to ambulate the patient, and signs of vasospasm developed in the fractured leg. A lumbar sympathetic block was done on July 28, with very good symptomatic results, and it was, therefore, repeated on July 31. On Aug. 2 the patient became sick, and by Aug. 3 there was evidence of a mass in the right lower quadrant, an ileus with vomiting, and a leukocytosis of 24,700. The prothrombin time at this time was 33 sec., as compared with a control of 15 sec. A retroperitoneal hematoma was suspected, but, because of the high white cell count and the age of the patient, it was felt that an appendical abscess could not be excluded. Therefore, on Aug. 4, the symptoms having progressed, surgical exploration was felt to be indicated. A transverse incision was made in the right flank, and retroperitoneal exploration revealed the psoas uscle to be distended with blood, the blood having extravasated usely between the muscle fibers. Because of the danger of orrhage, exploration through this incision was discontinued, nd a paramedian abdominal incision was made. The rectus muscle was retracted laterally, and the psoas muscle was approached transperitoneally. Careful examination of the muscle revealed no evidence of a bleeding vessel. The hemorrhage was diffuse; there was no clot formation, and a bleeding point could not be identified. A reasonable amount of blood was evacuated from the muscle by splitting the psoas fibers longitudinally. The contents of an ampule of topical thrombin were irrigated through the muscle fibers, and a gauze pack was placed into the defect in the muscle and brought out through the retroperitoneal incision. A Penrose drain was brought out through the abdominal incision. The wounds were closed in layers, and recovery from this operation was uneventful. No further evidence of bleeding developed in this man. The day after the operation he had an erythrocyte count of 3,590,000 and a leukocyte count of 12,200, with 11 gm. of hemoglobin. The prothrombin time at this time was still 35 sec., as compared with a normal of 15 sec., but by the next day it had fallen to 19 sec. The use of bishydroxycoumarin and heparin, was of course, discontinued.

COMMENT

A paravertebral procaine injection should not be considered to be a completely innocuous procedure. Although complications following this injection are exceedingly rare in normal patients, the deep injection of procaine in a hypocoagulatory patient may be followed by serious and undesirable effects. It is probably a good rule never to do any deep injections in a person who has had his clotting mechanism deranged.

In thrombophlebitis and phlebothrombosis the conflict between paravertebral block and anticoagulant therapy is easily resolved. Phlebothrombosis requires anticoagulant therapy and paravertebral block is contraindicated. Thrombophlebitis requires a lumbar block more urgently than anticoagulant therapy. The most awkward situation occurs in frostbite or impending arteriosclerotic gangrene when it would seem that both anticoagulants and lumbar blocks are indicated for maximum therapeutic effect. However, in the case of frostbile it is probably wiser to use one or the other and not to combine the two types of treatment. For arteriosclerosis the wisest course of action is lumbar sympathectomy followed by anticoagulant therapy in the postoperative period.

SUMMARY

The danger of doing a paravertebral lumbar sympathetic block in a patient receiving anticoagulant therapy is emphasized. The successful treatment of a psoas hematoma following such a procedure is described. The combination of anticoagulant therapy and lumbar sympathetic block is briefly discussed.

ANGIONEUROTIC EDEMA DUE TO FOREIGN BODY LONG PRESENT IN THE NOSE

REPORT OF A CASE

Bunim Pruzanski, M.D., Tel-Aviv, Israel

The following case report is considered of interest because an organic foreign body in the nose, a peanut, had given no local symptoms for years and was accidentally disclosed during routine otolaryngological examination in connection with angioneurotic edema, a sequel of the foreign body. The discovery of foreign bodies long present in the nose is an uncommon occurrence. Worthington[1] described a foreign body present for 13 years, Camerer,[2] for 17 years, Kelemen,[3] for 28 years, and Marks,[4] for 12 years. In none of these cases had the foreign body become the cause of angioneurotic edema as in the case described below, and I was unable to find a similar case in the available literature.

REPORT OF CASE

The patient, M. S., a married woman aged 21, was first seen on Nov. 17, 1949, when she was sent to me by the allergist, Dr. Loev, for routine otolaryngological examination and exclusion of focal infection. She complained of periodic swellings, appearing in various parts of her body for several years. Her eyelids, lips, forehead, wrists, and lower parts of her legs had been particularly affected. Her suffering had increased gradually, and during the last year she had awakened every morning with a

---

From the Otolaryngological Department, Mandelberg's Clinic, Kupat-Holim.

The patient was presented at the Meeting of the Tel-Aviv Section of the Israel Otolaryngological Society, November 17, 1949.

swelling of the face that usually receded during the day. Swellings of the extremities had occurred every week. She had had no pains except light headaches, and no fever but had suffered from very frequent colds. She remembered that when she was eight years old a tooth extraction of the left first upper incisor had been performed owing to some swelling of the upper lip. During the last few years she had been under the treatment of a general practitioner, had undergone several examinations allegedly including the ear, nose and throat, with no results, and she was finally transferred to the allergist.

The examination showed a normally developed young woman with normal throat and ears. In the mouth the left first upper incisor was missing and was substituted for by an artificial tooth. The nose was patent with no pathologic discharge. The floor of the nasal fossa was of equal level on both sides, but on the left, in the third anterior part of the floor, a greyish spot was disclosed. Touching of the spot with a probe yielded the impression of something hard and evoked a suspicion of a rhinolith deeply and strongly embedded in the floor of the nose. After several attempts to move the hard mass by means of a blunt hook, without anesthesia, the foreign body broke and was finally removed in three parts, the procedure causing almost no bleeding. Reconstruction of the parts produced a whole peanut, still in its shell, which measured 12 mm. in length and 7 mm. in diameter. The shell was relatively thick and hard. The kernel appeared to be a uniformly changed mass, soft, of cheeselike consistency, and strongly fetid. After removal of the foreign body a deep corresponding hollow in the floor of the nose became evident. The surface of the hollow was rough, and bleeding was nearly absent. The anterior part of the left inferior concha was underdeveloped.

The patient was exceedingly surprised when she saw the foreign body, and could not trace in her memory any episode suggesting the way or time it had entered her nose. Next morning there was no swelling of the face. The patient was sent home. I next saw her on July 30, 1950. Since the removal of the foreign body the bouts of swellings and colds disappeared completely, and the patient was cured and happy. In the nose, on the left side, I could no longer see the hollow, which was now filled up and covered with normal mucous membrane. The anterior parts of the left inferior concha remained underdeveloped.

COMMENT

The presence of the foreign body in the nose for at least 17 years may be assumed, since the patient could not remember putting it into her nose. The assumption is corroborated by the anatomical changes in the floor of the nose and of the left inferior concha and by the mentioned incident of lip swelling and tooth extraction in the patient's childhood. Of unique interest is the fact that the organic foreign body, the peanut remained undecayed as a whole for many years and caused no local symptoms but colds. In effect, no suspicion of its presence arose.

The case is an important contribution to the etiology of angioneurotic edema, as it shows that a foreign body in the nose, with no local symptoms, may cause angioneurotic edema. The complete recovery after removal of the foreign body is ample proof of it.

SUMMARY

A case of angioneurotic edema due to a foreign body long present in the nose is described.

The foreign body, a whole peanut, still in its shell, gave no local symptoms, supposedly, for 17 years but caused angioneurotic edema of the face and upper and lower extremities.

Removal of the foreign body resulted in full recovery.

28 Allenby Road.

REMISSION OF CUSHING'S SYNDROME FOLLOWING ADRENALECTOMY

REPORT OF A CASE

Seymour F. Wilhelm, M.D.
and
Emmanuel Dickler, M.D., New York

Recent studies with corticotropin (ACTH) and cortisone indicate that Cushing's syndrome is basically caused by hypersecretion of certain adrenal cortical steroid hormones.[1] Such adrenal hyperfunction, or perhaps dysfunction, may be caused by an intrinsic lesion of one or both of the adrenal glands, or may be activated by hormonal hypersecretion of the pituitary and possibly also of other endocrine glands. This newly acquired evidence supports the assumption that Cushing's syndrome may occur on a purely functional basis in the absence of demonstrable pathological changes in the adrenal glands. While some lesion of an adrenal gland, such as hyperplasia or neoplasm, has been demonstrated in most cases of Cushing's syndrome,[2] there are a few authentic cases in which the adrenal glands were found histologically normal.[3] Such was the case reported here of classical Cushing's syndrome in a woman aged 45, whose progressive downhill course was suddenly interrupted by a total left adrenalectomy.

REPORT OF A CASE

History.—On May 8, 1948, a female schoolteacher aged 45 was referred to the medical service of the Beth Israel Hospital by Dr. Arthur Fishberg with a diagnosis of Cushing's syndrome. Her chief complaints were swelling of the body, excessive hairiness, and the voiding of large amounts of urine. She had first noticed a rather sudden onset of swelling of the face, trunk, and lower extremities about 10 months prior to her hospital admission. She had next noticed an increasing adiposity of the face and trunk, and had discovered that she had gained 30 lb. (13.6 kg.). At the same time, she had become aware of an increased growth of thick dark facial hair, and a thinning and loss of scalp hair. Her skin had become quite dry and had assumed an unusual reddish color. Her breasts had decreased in size.

The patient had noticed an increase in thirst and appetite, as well as frequent urination. A little later there had been some weakness of the lower extremities and difficulty in walking. Vision had become poor, with blurring of distant objects. The menstrual history, which had previously been quite normal showed that she had been amenorrheal for the past eight or nine months. For about the same length of time, the patient had com-

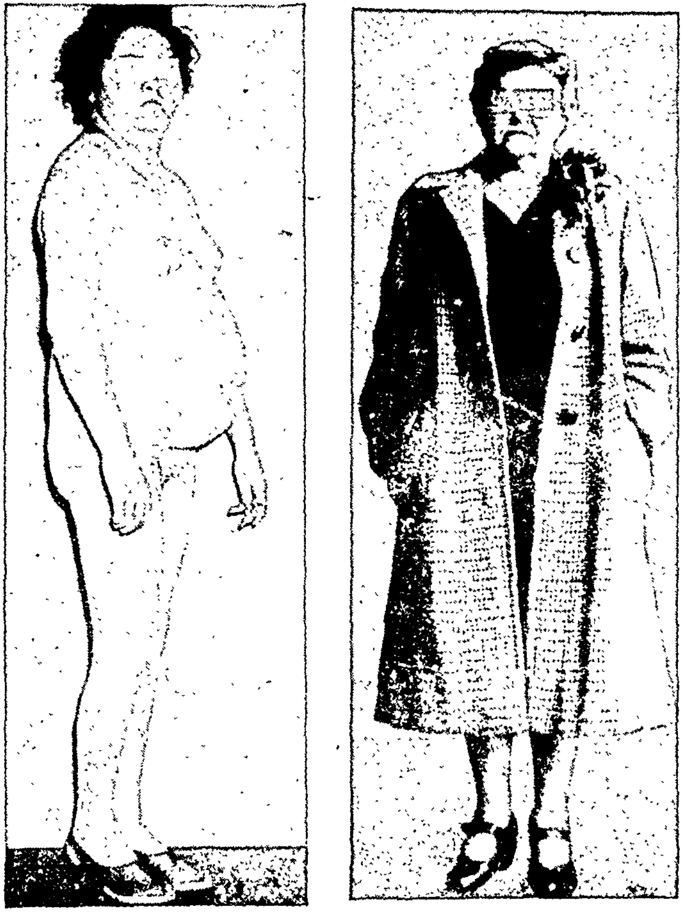
L., and Power, M. H.: The Pathologic Physiology of Adrenal Cortical Tumors and Cushing's Syndrome, in Laurentian Hormone Conference: Recent Progress in Hormone Research, Proceedings, 1947-1948, New York, Academic Press, Inc., 1948, Vol. 2, p. 345.

plained of moderately severe, sharp, fairly constant, nonradiating pain in the left loin. She gradually had become more irritable and mentally unstable, with frequent episodes of depression and weeping.

The patient had been healthy prior to the onset of the above symptoms, and both the past history and the family history were not remarkable.

Physical Examination.—The patient's appearance was typical of Cushing's syndrome; she had a moonlike face, buffalo-type adiposity, plethora, and numerous large purplish striae over the lower abdomen. There was an excessive amount of thick, dark, coarse facial hair whereas the hair on her scalp was sparse and dry. Her breasts were small and flabby. Her weight varied between 126 and 128 lb. (57.2 and 58.1 kg.).

Examination of the heart revealed a rough apical systolic murmur. The blood pressure was 180/120. The abdomen was very obese but no masses were palpable. There was slight tenderness in the left costovertebral region.



Left, preoperative photograph (May 1948). Right, photograph made two and one-half years after the operation (Dec. 16, 1950).

Laboratory Data.—Urine examination before breakfast on May 10, 1948, showed 1 + glucose and 1 + albumin, but no acetone. Microscopic examination was negative. Glucose from 2 to 4 + was found in all the urine specimens examined during the next three days. The basal metabolic rate was + 3.

On May 11 fasting blood glucose was 194 mg. per 100 cc.; a glucose tolerance test showed a typical diabetic curve. The total blood proteins were 6.9 mg.; albumin 4.9; globulin 2.0. Blood chlorides were 588 mg. per 100 cc.; blood sodium 308.8 mg. per 100 cc.; blood potassium 18 mg. per 100 cc.

On May 13 a 24-hour specimen of urine was collected for determination of the 17-ketosteroids. The total volume was 1,960 cc., and contained 15.9 mg. of 17-ketosteroids. A test for dehydroisoandrosterone was negative.

A second urine specimen collected on May 17 was also negative for dehydroisoandrosterone. The total volume was 2,820 cc. and the 17-ketosteroids were 21.3 mg.

On May 18 the blood calcium was 8.6 mg. per 100 cc.

An electrocardiogram was reported as showing insufficient changes to indicate myocardial involvement.

An electroencephalogram revealed generalized dysrhythmia and a moderate increase in fast and slow activity. The possibility of a deep-seated midline lesion was considered. Visual field studies showed no significant abnormality.

X-ray Examination.—A lateral film of the skull reveale some mottling of the bones of the vault, but the sella turcic was normal in size. There was some absorption of the posterio clinoids.

The lungs were normal, but there was a slight ventricular en largement of the heart.

The long bones showed no abnormality, but the lumbar spin was the seat of productive spondylitis.

On excretory urography, the pelves and calyxes of the kidney were not well visualized, and the bladder appeared normal.

Perirenal insufflation was done on May 14, 1948. With a pneu mothorax apparatus 500 cc. of air was injected on each sid Both kidneys were normal in size, shape, and position, and bot adrenal glands were clearly delineated. The right adrenal shado appeared normal in size and shape; the left was somewhat larg than the right.

In view of the laminagraphic findings and the progressive unfavorable course of the patient, it was decided to explore th left adrenal region. On the day prior to operation, adrenal co tex extract and 10 gm. of sodium chloride were administere

Operation.—On May 20, 1948, the left adrenal gland was e posed through a lumbar incision. It was encased in a sheath adherent fat, but was normal in size, shape and appearanc Nevertheless, a total left adrenalectomy was done.

The pathological report made by Dr. Henry Brody showe the following:

Specimen: Left adrenal gland and fat tissue. Gross: Resecte adrenal gland together with several very tiny fragments adrenal tissue, in all weighing 4.7 gm. The gland measur 4.1 x 2.7 cm. and was essentially quadrilateral in shape. showed the usual thickened central region and at the thicke point measured 0.8 cm. On section practically no medulla w seen at any of the many levels examined. Distinct laminati was not made out. The outer cortical zones were yellow to y low-brown with numerous pinhead brighter yellow areas. An o casional somewhat larger than pinhead, deep brown to bla nodule was seen. There was an inner deep brownish-black zo of irregular thickness. Sections in formaldehyde solution and gelatin were made. Sections for special histochemistry we made, and the remainder of the gland was taken for lipidanalys About 1 tablespoon of periadrenal fat tissue was received. O section was made.

Microscopic Examination: The cortex was relatively thic The glomerular zone tended to be thin and poorly formed. T fascicular zone was the thickest portion of the cortex, but show fasciculate arrangement only in part. Portions of it were qui rich in lipid, as seen in Sudan IV and Sudan black stains. Oth portions were quite granular and in the lipid stains showed n fat. The reticular zone contained less pigment than would ha been judged from the gross appearance of the gland. No fuchsi ophil cells were found. In places the cortex appeared somewh nodular, and an occasional extra capsular nodule was foun An occasional cluster of cortical cells was seen in the midst the medulla, and these tended to give a somewhat deeper Sud reaction than other lipid-containing cortical cells. There w some hemorrhage in the capsule and cortex, probably of tra matic origin.

Diagnosis: Nonenlarged adrenal gland, showing perhaps ve slight hyperplasia of cortex.

Postoperative Course.—The patient withstood the operati procedure well, and returned to the ward in good condition. H postoperative course was uneventful, with only minimal febri reaction. Her blood pressure was maintained at a satisfacto level, and on the second postoperative day was 148/70. Th wound healed by primary union.

During her postoperative hospital stay, the patient reporte a sense of well-being and was able to walk about with greate ease. Her spirits improved and her visual disturbance was als diminished. She left the hospital on May 31, 1948. At home th physical and mental recovery continued steadily.

Follow-up Observations.—A progress note on July 7, 1948 pointed out the following. Clinically, the patient appeared to b much improved. Her mental attitude was much better. Th leonine facies, which she had, was much lessened. Her sister stated that she was more normal at home, having regained her sense of humor, and the patient was now able to partake in social functions.

After the examination on July 7 a course of x-ray therapy directed to the pituitary was begun. There was administered 2,400 r (scatter) to each of the left temporal, right temporal and forehead portals from July 7 to Aug. 4, 1948. The sella dose was calculated at 2,640 r. The physical factors were 200 kv.; 0.5 copper; 1.0 aluminum; half value layer 1.39 mm. copper; target skin distance 50 cm.; and r per minute 24.6.

Improvement continued, and in August, three months after the left adrenalectomy, the urinary 17-ketosteroid excretion had dropped from a preoperative level of 21.3 mg. in 24 hours to 9.8 mg. The blood glucose was now normal and there was no glucose in the urine. The blood pressure, which prior to operation had been 180/120, had now fallen to 140/80.

On Sept. 30, 1948, the patient stated that she felt completely normal. She had lost all the symptoms of diabetes and the abnormal hair had fallen out. The patient's general appearance was normal; she was cheerful and less obese. Her blood pressure was 134/70.

On Dec. 24, 1949, the patient stated that she felt well mentally and physically and that she was carrying a full program in her school work. As a result of diet and medication (amphetamine [benzedrine®] sulfate and thyroxin), she had lost 36 lb. (16.3 kg.) in the preceding four months. Her blood pressure, however, was 190/90. This elevation was ascribed to the amphetamine and thyroxin. A urine specimen was negative for glucose.

On Jan. 15, 1949, the patient was well and appeared normal except for a recent weight gain of 15 lb. (6.8 kg.). On Jan. 14 the patient began to menstruate for the first time since the onset of her illness about one and one-half years previously. Her blood pressure was 140/90. She was placed on a low caloric diet in order to determine whether her recurrent obesity was due to overeating.

On Feb. 19, 1949, her blood pressure was 140/90. The abdomen was only slightly obese, and there was complete loss of the abnormal hair. The patient's weight had remained stationary.

On April 2, 1949, she was well, but still obese. Menstruation occurred regularly every month, the period lasting four days. Her blood pressure was 130/80. She weighed 159 lb. (72.1 kg.). X-ray examination of the skull showed some recalcification of the posterior clinoids. The skull otherwise appeared the same as on previous examination.

On June 17, 1949, the patient's only complaint was that of obesity. The blood pressure was 135/90, and menstruation continued regularly at monthly intervals.

On July 18 the patient had lost 8½ lb. (3.8 kg.) while under the care of her private physician. Her blood pressure was 140/80. She was menstruating at the time of this examination.

On Aug. 17 the patient's only complaint was that of general tiredness. There was evidence of a recent weight loss. Her blood pressure was 145/70.

On Nov. 5 the patient weighed 135 lb. (65.2 kg.), representing a loss of about 25 lb. (11.3 kg.) as a result of a low caloric diet and amphetamine. The abdominal striae were no longer present, but an incisional lumbar hernia was noted. The blood pressure was 160/80.

On May 10, 1950, the patient's only complaint was that of bilateral ankle edema after prolonged standing. She was actively employed in her profession. The menstrual periods had been regular until Nov. 1949, when they had suddenly stopped. The stopping was considered to be menopausal. The patient's weight was 115 lb. (52.1 kg.) and her blood pressure was 180/90. She was very excited at the time of this blood pressure reading. Urine examination was negative for glucose.

On Dec. 16, 1950, the patient stated that she had been feeling well except for occasional headaches and slight weakness in the left leg when walking upstairs. She was working regularly and enjoying an active social life. The heart sounds were normal and regular. Her blood pressure was 165/115; and her weight, 116 lb. (52.6 kg.). She complained of a moderate sized left lumbar incisional hernia. The 17-ketosteroids were 13.9 mg. in 24 hours. Blood sodium was 137 mEq.; chlorides, 104.8 mEq.; glucose, 116 mg. per 100 cc.; total proteins, 6.22 mg. per 100 cc.; albumin, 4.37; and globulin, 1.85.

COMMENT

A woman aged 45 with a classical Cushing's syndrome was apparently completely relieved after total surgical excision of a grossly normal adrenal gland, and subsequent pituitary irradiation.

Remission of Cushing's syndrome after the enucleation of an adrenal neoplasm has occurred by now with sufficient frequency not only to establish the causal relationship of such tumors to this disease, but also to indicate their surgical removal whenever possible.

In 1936 Kessel[4] reported Crile's case of a typical Cushing's syndrome in a girl aged 17. Following bilateral adrenal denervation and a right partial adrenalectomy, the hirsutism and obesity disappeared, the blood pressure and sugar tolerance returned to normal, and the patient was apparently well for about one and one-half years. Then, however, the patient died rather suddenly of an acute intercurrent infection, and, at autopsy, a basophilic adenoma of the pituitary was found. Relief of symptoms had been accomplished by reducing the adrenal function even though the primary lesion was in the pituitary.

Urinary 17-Ketosteroids

Date	Urine Volume in 24 Hr.	17-Ketosteroids in 24 Hr.	Dehydroiso-androsterone
5/13/48	1,960 cc.	15.9 mg.	Negative
5/17/48	2,820 cc.	21.3 mg.	Negative
5/20/48	Left Adrenalectomy		
5/25/48	2,080 cc.	10.6 mg.	....
8/27/48	590 cc.	9.8 mg.	....
2/12/49	860 cc.	22.1 mg.	....
11/ 5/49	1,080 cc.	12.3 mg.	....
12/16/50	1,710 cc.	13.9 mg.	....

Recent experience with corticotropin and cortisone indicates clearly that the symptoms and signs of Cushing's syndrome are basically due to hypersecretion of steroid hormones by the adrenal cortex. Surgical excision of an adrenal is probably followed by a sudden diminution in the total cortical hormone secretion. This, indeed, seemed to be the case in two adrenalectomies for hyperplasia with female pseudohermaphroditism done by one of us (S. F. W.).[5] In both of these patients the 24-hour excretion of the neutral 17-ketosteroids was almost exactly halved after total excision of the one adrenal.

In the patient described in this article, the prompt remission of the Cushing's syndrome after surgical excision of a grossly normal adrenal gland may also be ascribed to an abrupt quantitative reduction in adrenal cortical hormone secretion.

The evaluation of the pituitary irradiation is more difficult, since it was begun only seven weeks after the adrenalectomy when marked improvement had already occurred. In previous reports, the results of radiotherapy in Cushing's syndrome have been inconstant and at best temporary, except in isolated cases. The x-ray therapy in our patient may, however, have contributed to the completeness of the remission, as well as to its duration.

---

[5] Wilhelm, S. F.: Resection of Hyperplastic Adrenal Glands for Female Pseudohermaphroditism. J. Mt. Sinai Hosp. 14: 679, 194[illegible].

While spontaneous remissions of Cushing's syndrome have at times been observed, the prompt improvement after operation affords strong evidence that in this case the adrenalectomy was the decisive stroke which interrupted and reversed the morbid course.

ASPIRATING BRONCHOSCOPE FOR THE GENERAL SURGEON, OBSTETRICIAN, AND ANESTHETIST

Ernest B. Emerson Jr., M.D., Rochester, New York

Over the last 10 yr. the problem of postoperative atelectasis, the problem of the patient with aspirated vomitus, and similar problems have become more generally appreciated. Indeed, the literature contains an ever increasing volume of material on such emergencies, but a discussion of them is beyond the scope of this paper. However, as a result of the more general appreciation of these emergencies, my associates and I have noted an ever increasing number of inquiries from former students and residents, located where experienced bronchoscopists are not available, as to what instruments they should buy to care for their patients. Many of these men are working at places where financial resources are limited, and in more than one communication the request has included a desire for information concerning the absolute minimum of [illegible] needed for bronchoscopic examination. With [illegible] factors in mind, that is, (1) reducing the equipment to a minimum in order to cut the cost, (2) simplifying the equipment in order to eliminate the technical difficulties (usually electrical) inherent in the more conventional bronchoscopes, and (3) maximizing ease of insertion and safety in the hands of men not especially trained in endoscopy—we have made certain modifications in bronchoscopes already existing.

As in the case of the equipment previously described for handling tracheobronchial aspiration in the newborn,[1] this bronchoscope is designed not as a substitute for the more highly developed instruments and techniques but as an instrument which may be lifesaving under the circumstances already indicated.

THE INSTRUMENT

To fulfill the first two requirements, that is, to limit the cost and total amount of equipment necessary, it was decided to incorporate into one instrument the power supply, oxygen carrier, and bronchoscope. Thus, it was possible not only to eliminate battery boxes, transformers, and light cords from the cost but to simplify the whole bronchoscopic setup as well. Thi was not entirely a new idea since anesthetists have ha laryngoscopes made this way for years, and Dr. Feni- more E. Davis has designed such a bronchoscope.

The third requirement, that is, ease of insertion an safety, posed more of a problem. However, experienc over the past 11 yr. in training surgical interns in al sorts of bronchoscopes has pointed repeatedly to th fact that the newcomer to bronchoscopy finds th Israel type of instrument[2] by all odds the easiest t master. In addition to ease of insertion, this type c bronchoscope, since it is inserted directly, eliminate another accessory, which in itself is hard to handl namely, the laryngoscope. Therefore, the battery containing handle of the instrument was placed in position opposite to that of the Jackson and presen existing battery-containing bronchoscopes. This re sulted in a bronchoscope that can be used with fair eas of insertion even by the beginner.

The barrel or tube of the bronchoscope is 2¼ in (5.72 cm.) shorter than the standard adult diagnosti Israel bronchoscope and is, therefore, safer since i cannot be inserted deeply into the bronchus wher damage is most likely to occur. It is, however, lon enough for either bronchus to be entered and allo direct vision for guiding the suction tube deeper int the lung. Further, the tube of the bronchoscope tapered, being 7 mm. at the distal end and 9 mm. at th handle.[3] This tapering has two advantages: First, fo the untrained eye, vision through a long tube is facil tated, and, second, more freedom of motion with th suction tube is allowed without undue movement the bronchoscope. Both of these advantages are appr ciated by the novice and by the person who does only a occasional bronchoscopy.

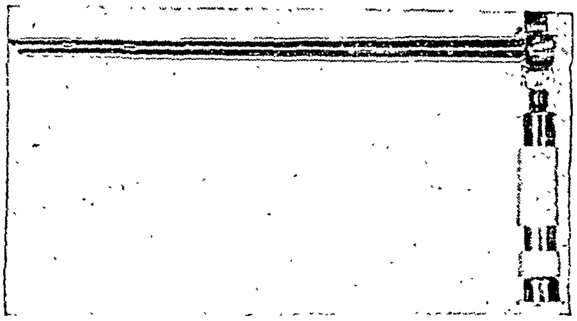

Fig. 1.—The bronchoscope. The handle contains the batteries and h been placed so as to be dependent during insertion of the instrument. T tube is narrower at the distal end.

TECHNIQUE

It is not the purpose of this paper to go into the fir points of bronchoscopic techniques as used by thorac surgeons and endoscopists, but, since the instrume is being presented for the emergency use of operato belonging to groups other than the foregoing, certai points in its use should be emphasized.

If the patient is under general anesthesia, the prob lem of coughing and gagging does not arise. Howeve if the emergency involves a conscious patient it i usually sufficient to anesthetize the throat by carefull

---

From the Department of Surgery, Division of Otolaryngology, University of Rochester School of Medicine and Dentistry.

The bronchoscope herein presented is available, to the profession, at The Foregger Company, Inc., 55 W. 42d St., New York 18.

spraying it three to four times with 2% tetracaine (pontocaine®) hydrochloride. This will eliminate or deaden the gag and cough reflexes sufficiently enough to allow insertion of the bronchoscope. Tetracaine may be used intratracheally if desired, but the nature of the emergencies for which the instrument was designed contraindicates actual tracheal anesthesia, since coughing aids in bringing the foreign material to the suction tip once the tracheobronchial tree has been entered.

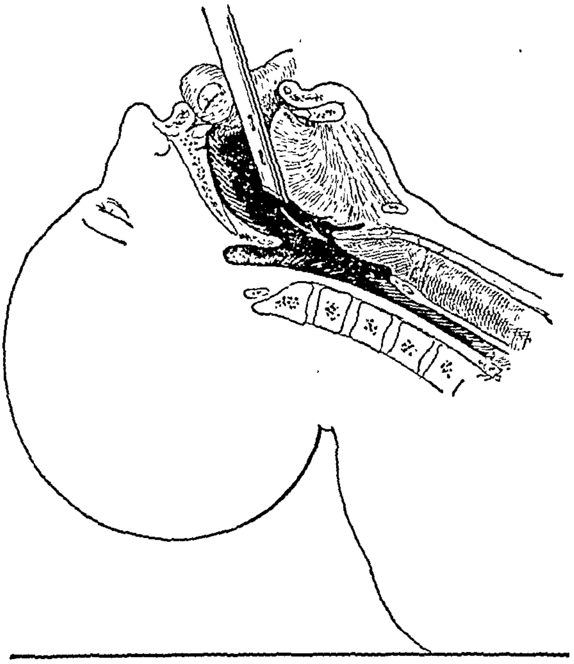

Fig. 2.—The beginning of the insertion of the emergency bronchoscope over the left thumb to the point at which the epiglottis is visualized.

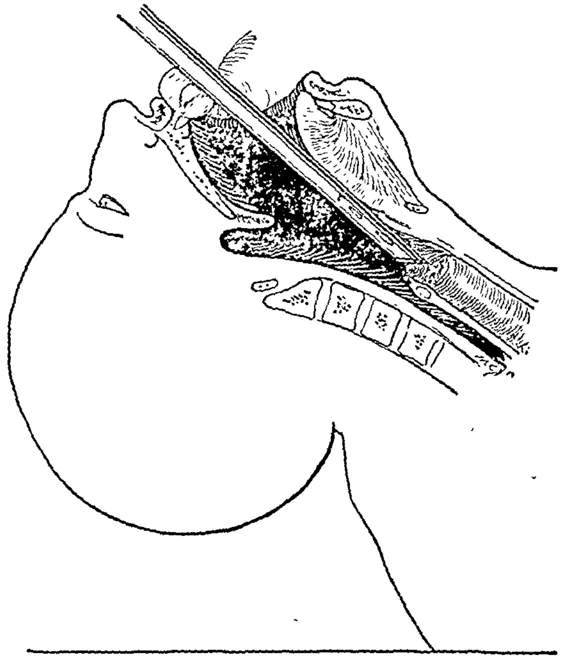

Fig. 3.—The bronchoscope has been advanced to the vocal cords, both the tongue and epiglottis having been pushed up and away by the tube.

Most physicians using a bronchoscope for the first time will find the atmosphere of the operating room and the additional help available there comforting. However, once the instrument has been mastered it is comparatively easy to perform the procedure in the patient's room. By placing the patient diagonally on a Gatch bed, the necessary position can be obtained; in the absence of assistance a pillow under the shoulders and neck will facilitate matters. It is under these circumstances that a one-piece bronchoscope and light source is most fully appreciated.

Insertion of the bronchoscope is initiated by placing the left thumb over the upper teeth or gum, where it serves as a fulcrum and a guard against dental damage. Over this thumb the instrument, held in the right hand, is inserted into the mouth until the uvula comes into view (Fig. 2). Then, using the thumb as a fulcrum, the handle of the scope is brought slowly down, the barrel thus lifting the tongue up out of the way (Fig. 3). At the same time, the instrument is advanced deeper into the throat and, as the epiglottis is visualized, is passed under it, the epiglottis in turn being lifted up and away in the same manner as the tongue. At this point the vocal cords are visualized, and the head is then extended far enough to allow full view of the glottic chink. As soon as the cords open, in inspiration, the scope is turned sideways, and the bill is slipped quickly between the cords. From this point on the tube is easily advanced, under direct vision, to the desired position in either main bronchus (Fig. 4). The simple insertion of the suction tube, the only other instrument needed, and the removal of the offending material completes the procedure, and the two instruments are quickly withdrawn together.

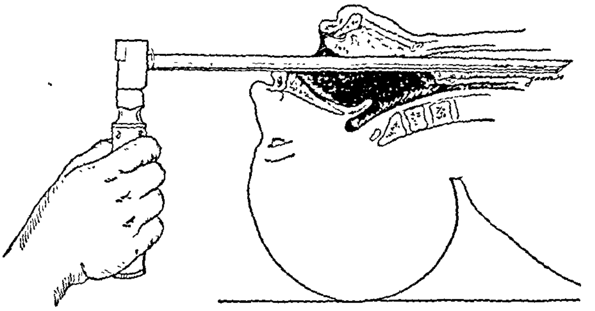

Fig. 4.—With the head extended, the bronchoscope has been carried on into the trachea.

SUMMARY

An emergency aspirating bronchoscope suitable for use by surgeons, obstetricians, and anesthetists has been presented. The instrument reduces the total cost of equipment to a minimum since it eliminates many of the accoutrements of conventional bronchoscopy. The instrument has been designed with an eye to ease of use and maximum safety in the hands of operators not specializing in endoscopy. The bronchoscope described has been found satisfactory for the use for which it was designed—that is, the emergency aspiration of foreign material, such as mucus, blood, and vomitus, in atelectatic lungs of traumatic or postoperative origin or the removal of aspirated material from the tracheobronchial tree of the flooded lungs of the very ill. It is believed that the availability of such equipment will, in many instances, be lifesaving in the absence of a trained bronchoscopist. It has occurred to me, on the basis of three and one-half years of active duty with the armed forces, that this instrument would make an ideal all-purpose bronchoscope for military purposes.

DISLODGING FOREIGN BODIES, INSPIRED OR SWALLOWED BY CHILDREN, WITH AMINOPHYLLINE

I. Newton Kugelmass, M.D., New York

Children inspire or swallow foreign bodies because they explore things with their mouths. Inspiration of such objects into the air passages is usually the result of a sudden gasp for breath after excitement, crying, or laughing, but swallowing may force an object over the laryngeal aperture. If a foreign body lodges in the esophagus, it is too large or too spiky to pass through to the stomach.

An asthmatic girl swallowed a bead without her mother's knowledge, and soon a spastic persistent cough developed. Because of the indefiniteness of signs in the lungs, diagnoses of whooping cough, enlarged mediastinal glands, and bronchopneumonia were made. I observed her first during a true asthmatic attack and prescribed aminophylline solution by rectal retention. The asthmatic attack cleared temporarily, and the bead that had lodged in the bronchus was coughed up.

This observation led me to use aminophylline in other patients suspected of inspiring or swallowing foreign bodies. Its relaxing effect on the bronchial musculature was prompt. Rectal administration of 0.25 gm. (4 grains) aminophylline in solution dislodged small, smooth foreign bodies in the esophagus, larynx, and bronchus in the following cases. If this simple procedure failed, the patient was hospitalized for further study.

REPORT OF CASES

CASE 1.—Congenital stenosis of the esophagus without fistula formation became apparent with the introduction of semisolid food in a 4 mo.-old-female child. Diagnosis was confirmed by roentgenologic studies. Treatment by esophagoscopic dilatation was carried out by Dr. Chevalier Jackson. In the interim the infant experienced marked distress after taking solid food in excess of her capacity. She vomited, coughed, struggled, and became cyanotic when she ate too much or too quickly. The mechanical difficulty was cleared completely and effectively with rectal retention of a solution of 0.2 gm. (3 grains) aminophylline containing 0.06 gm. (1 grain) ethyl aminobenzoate (anesthesin®) to prevent local pain and subsequent nausea.

CASE 2.—Catarrhal esophagitis complicated pneumonia in a 3 year old boy. He experienced substernal pain on swallowing, dysphagia, and hematemesis. The symptoms cleared at the onset with a rectal retention of 0.20 gm. (3 grains) aminophylline and 0.06 gm. (1 grain) ethyl aminobenzoate in solution. The difficulty in swallowing on the second day was completely alleviated by the same treatment.

CASE 3.—Esophageal foreign body was suspected in a 5 year old girl who said that something stuck in her throat. She refused to take solid food and had difficulty in swallowing. Then she began to cough, gag and choke. Frightened, she volunteered the information that she swallowed a pearl button. Fluoroscopic examination localized it in the cervical esophagus. A solution of 0.25 gm. (4 grains) aminophylline and 0.06 gm. (1 grain) ethyl aminobenzoate was given by rectal retention before admission to the hospital for esophagoscopic removal. The button was released spontaneously.

CASE 4.—Laryngeal foreign body was the unsuspected ca of croupy cough with aphonia and moderate fever in a 14 mo old girl. The family physician admitted her to the contagi ward. Treatment with diphtheria antitoxin and penicillin in tions, steam inhalation, and emetics was unsuccessful. Fina roentgenographic and laryngoscopic examination revealed a eign body in the sagittal plane, but the mechanical problem fo a preliminary attempt at removal. The infant was dischar from the hospital before direct laryngoscopy could be repea I prescribed aminophylline solution by rectal retention th times a day. On that same day a plastic part of a toy was coug up. Thereafter, the hoarseness, dyspnea, and wheeze cleare

CASE 5.—Laryngeal foreign body was lodged four mo without producing symptoms in a 7 year old girl. She was tre with rectal retentions of aminophylline solution for a se attack of asthma. She suddenly coughed up the ivory tip c pencil. Apparently, this small, smooth object produced repe attacks of coughing that were confused with the accusto asthma. Eventually the larynx had adjusted to this foreign bc as there were no such symptoms for months except dyspnea exertion.

CASE 6.—Bronchial foreign body was diagnosed from history of a 4 year old girl who suddenly began to choke du play. She explained that the glass eye of her doll "went in." apparently went straight down the trachea into the larger m vertical right bronchus. The breath sounds were reduced, wheezing became audible on that side. Aminophylline solut was given by rectal retention before hospitalizing the child. object was coughed up and all symptoms cleared.

1060 Park Ave.

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

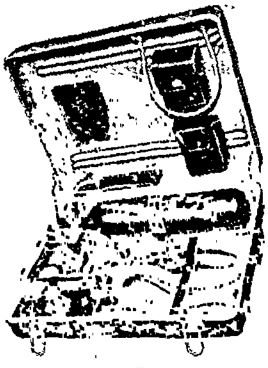
The Council on Physical Medicine and Rehabilitation authorized publication of the following report.

RALPH E. DE FOREST, M.D., *Secretar*

M. S. A. PNEOLATOR ACCEPTED

Manufacturer: Mine Safety Appliances Company, 201 N Braddock Ave., Pittsburgh 8.

The M. S. A. Pneolator is a device for administering artifi respiration by means of intermittent positive pressure with *suction*. The apparatus is housed in a carrying case resemb a heavy suitcase or steamer trunk, the motive power is supplied by compressed oxygen in a cylinder. carrying case measures 20 by 66 by cm. (8 by 26 by 21 in.), and with contents it weighs 23 kg. (50 Crated for shipment it measures 2 68 by 58 cm. and weighs 25 kg. lb.). Spare cylinders and an auxil attachment for the simultaneous tr ment of a second patient are *not* cluded in the above weights.



M. S. A. Pneolator

From acceptable sources the Co cil obtained evidence that the phys performance of the apparatus was represented by the manufacturer. cause evidence at hand, however, is not sufficient to establ its usefulness as an emergency respirator for use *by fire dep*ments and rescue squads, it is not accepted for this purpo The Council on Physical Medicine and Rehabilitation voted accept the M. S. A. Pneolator as an artificial breathing ap ratus for use in hospitals, operating rooms and other medi institutions under the direction of a physician.

REPORTS OF OFFICERS

REPORT OF THE SECRETARY

To the Members of the House of Delegates of the American Medical Association:

The secretary respectfully submits the following annual report:

Membership

The table showing the number of members of the American Medical Association by states and territories which it is customary to present in the Secretary's report has not been prepared. It has been thought better to wait until next year when it will be possible to submit a more accurate and informative listing.

As of Oct. 1, 1951, there were 107,345 members of the American Medical Association who had paid their 1951 membership dues. In addition to this number, there were many more who were exempt from payment of dues but who were still carried as members, such as disabled physicians, residents and physicians temporarily absent on active service in the Armed Forces. There are approximately 7,500 Service Fellows, who have direct Fellowship and do not pay dues as members. The exact count of members will be made just prior to December 1, so as to supply all secretaries of constituent associations with the number of members on which the apportionment of delegates from their associations for 1952 will be made.

The Membership and Subscription Department has been functioning for many years under a system that was rather antiquated but worked well until 1950. With the complete change by which dues were levied on members, this system has proven inadequate. The Executive Committee of the Board of Trustees recently authorized a survey of this department by a management engineering firm. This company made a very careful analysis and report and recommended the installation of International Business Machines to facilitate the work of the department. The plan was accepted, and the department is now undergoing a complete reorganization. It is expected that by the first of the year the reorganization will have progressed to such a point that the keeping of the Association's membership records will be more efficient and up to date.

Field Activity

There have been many demands during the past year on the Secretary and the Assistant Secretary to appear at medical meetings throughout the country. The demands for these personal appearances seem to be increasing from year to year. In addition, liaison with numerous other national medical societies makes more and more demands on the executives of the headquarters staff, so that travel has increased to an appreciable extent.

Resolutions to Be Presented to the House of Delegates

The Secretary has received the following resolution, which is to be presented to the House of Delegates by delegates of the Ohio State Medical Association:

RESOLUTION ON PLACE OF INTERIM SESSIONS OF HOUSE OF DELEGATES

Whereas, It has been customary for the House of Delegates to hold its interim session during the Clinical Session of the American Medical Association; and

Whereas, This has required excessive travel on the part of many delegates who seldom have time to attend the Clinical Sessions; and

Whereas, This requires travel on the part of many members of the staff of the Chicago office of the American Medical Association to some distant city and the shipment of many records and supplies from Chicago, entailing considerable expense to the Association; therefore be it

Resolved, That interim sessions of the House of Delegates be held in Chicago in December each year, and that this change become effective in 1953.

The following resolution, which also will be submitted to the House of Delegates at the Los Angeles Session has been received from the Medical Society of the State of North Carolina:

RESOLUTION ON NEGRO PHYSICIANS IN NORTH CAROLINA

Whereas, The members of the Medical Society of the State of North Carolina are anxious to maintain the cordial relations existing between the white and Negro physicians in North Carolina; and

Whereas, They recognize the advantages to the Negro physicians of membership in the American Medical Association; and

Whereas, At present it is not feasible, because of limits of space in the hotels of North Carolina, and also because of existing custom, to attempt to have joint meetings of both groups; and

Whereas, The Old North State Medical Society, which for fifty-three years has been the state organization of Negro physicians, has asked to be admitted "as a constituent association of the American Medical Association"; and

Whereas, The House of Delegates of the Medical Society of the State of North Carolina, at its annual meeting in May 1951, voted to approve this request and sponsor the Old North State Medical Society as a constituent of the American Medical Association; therefore be it

Resolved, That the House of Delegates of the American Medical Association approve the recognition of the Old North State Medical Society as an affiliate of the Medical Society of the State of North Carolina, and also of the American Medical Association.

The Secretary has also received a resolution to be introduced by a delegate of the Oregon State Medical Society, as follows:

RESOLUTION ON APPROVAL OF INTERNSHIPS

Whereas, Interns should be appointed to hospitals that have adequate facilities and organization for carrying on this type of training; and

Whereas, The number of internships should be limited to approximately the number of medical students graduating and applying for such positions, leaving some excess for fair competition between hospitals; and

Whereas, The quota of interns assigned to a hospital should be based on an up to date survey of the facilities for adequate intern training offered by the hospital; therefore be it

Resolved, That any future plan for the approval of internships adopted by the Council on Medical Education and Hospitals shall conform to these principles.

Appreciation

The Secretary desires again to offer an expression of his sincere appreciation for the assistance and many courtesies he has received from the officers and members of official bodies of the American Medical Association, as well as from many officers and members of the constituent and component medical societies. The personnel at Association headquarters, numbering 838, are deserving of praise for loyal and efficient contributions to the administration of the Association's affairs.

Respectfully submitted,

GEORGE F. LULL, Secretary.

REPORT OF THE BOARD OF TRUSTEES

To the Members of the House of Delegates of the American Medical Association:

The following annual report of the Board of Trustees is respectfully submitted:

Report on Matters Referred by House of Delegates

Resolution on Income Tax Exemption.—In accordance with the action taken by the Board of Trustees, as reported to the House of Delegates in June 1951, on the Resolution on Income Tax Exemption introduced by Dr. J. Wallace Hurff, New Jersey, in June 1950, preliminary steps are being taken to initiate within the Bureau of Internal Revenue the procedures necessary for a review of the 1921 ruling which denies deductions to physicians for expenses incurred in taking postgraduate courses. The report of the Bureau of Legal Medicine and Legislation contains an item on this subject. Further reports will be made from time to time as new developments occur.

Resolution on Free Choice of Physicians for Federal Employees.—The Board referred back to the Council on Industrial Health the resolution introduced by Dr. J. Stanley Kenney, New York, in June 1949. A report has been received to the effect that a meeting was held on October 17 between representatives of the Council on Industrial Health and Dr. Kenney, at which it was announced that he would submit an official statement on the subject. This statement, when received, will be presented to the House of Delegates.

Retirement Benefits and Pension Plans.—Three separate resolutions having to do with retirement benefits and pension plans for professional persons were submitted to the House of Delegates in June 1951 by Drs. W. D. Stovall, Wisconsin, W. H. Huron, Michigan, and W. P. Anderton, New York. The Board strongly supported the Ives amendment to H. R. 4473, 82d Congress, which would authorize the tax free diversion of certain sums each year by physicians, among others, for the purpose of purchasing retirement and other benefits. However, the Ives amendment was not adopted by this session of Congress. It is possible that some plan comparable to the amendment will come up for consideration again in the second session of the 82d Congress, in which event the Association will again vigorously support it. The report of the Bureau of Legal Medicine and Legislation contains a statement on this matter.

Resolutions on Publicizing American Medicine.—These resolutions presented by Dr. Edward P. Flood, New York, in June 1951 were referred to the Department of Public Relations for implementation. The Department expects to have a report on the subject matter in the near future.

Resolution on Stamps of Approval for Iodized Salt Packages.—This resolution introduced by Dr. William A. Hyland, Michigan, was referred to the Council on Foods and Nutrition, which has reported that at the present time fifteen different brands of iodized salt have been accepted and have been accorded the seal of acceptance of the Council.

Resolution on Distribution of Medical Care.—The Board of Trustees referred to the Committee to Study the Twelve Point Program the resolution introduced in June 1951 by Dr. William F. Costello, New Jersey. The Committee held a meeting on October 27 in New York at which this resolution was discussed, and a report will be submitted to the House of Delegates at the Los Angeles Session.

Resolution on Costs of all Technical and Professional Training.—The resolution introduced by Dr. E. F. Hoffman, California, was referred by the Board to the Council on Medical Education and Hospitals and the Bureau of Legal Medicine and Legislation for study and report.

Resolutions on Medical Relations in Workmen's Compensation.—The Board referred to the Council on Industrial Health the report of the Reference Committee on Industrial Health with respect to the report of the Council on the Resolutions on Medical Relations in Workmen's Compensation, adopted by the House of Delegates in June 1950. The Board requested the Council to submit another report when complete returns are available from the persons contacted with respect to this matter. Final action by the Board will be held in abeyance until a final report is forthcoming.

Membership, Fellowship and Dues

There was much discussion of the meeting of the House of Delegates in June relative to the continuation of the classification of Fellowship and of the levying of Fellowship dues. This matter was referred to the Board of Trustees. In addition, the Committee on Constitution and By-Laws has given careful consideration to this subject and will present a report to the House. The Board of Trustees recommends that there be only one class of membership and, consequently, also recommends that for the year 1952 no Fellowship dues be charged. The Board wishes to call the attention of the House of Delegates to the fact that by doing away with Fellowship dues, the Association will lose approximately $350,000 of income.

Public Relations

The recommendation from the House of Delegates that continued efforts be made to increase the interest, education and participation of physicians in public relations has received the careful consideration of the Board of Trustees. Every effort is being expended to implement this recommendation of the House. It is hoped that those delegates who find it possible will attend the meetings on medical public relations held immediately before the Clinical Session convenes.

Expression of Appreciation to Woman's Auxiliary

The Board of Trustees wishes to express its deep appreciati of the many fine programs being conducted by the Woman Auxiliary to the American Medical Association and by t woman's auxiliaries to the constituent associations. The projec undertaken by the Auxiliary vary from one state to another r flecting local interests and needs, but in almost every instan these projects are conducted with enthusiasm and effectivene They include nurse recruitment drives, promotion of *Toda Health,* participation in the programs of other organizatio distribution of health education material, civil defense and ma other activities. Their role in getting out the vote in 1950 a publicizing the issues cannot be given sufficient credit. In ma states it was the persistent efforts of the Woman's Auxiliary th produced such favorable results.

The Board of Trustees calls attention of the House of De gates to these many desirable activities of the national and co stituent woman's auxiliaries because of the urgent need for su port and guidance of these activities by sympathetic medi societies. The representatives of the auxiliaries have repeate asserted that the quality of their programs reflects the inter of the medical society concerned, and that lack of support fro the medical society results in no program at all or activit that are inadvisable.

The year 1952 is a key year in the history of medicine. It *highly important that medicine utilize to the fullest all of* resources. One of the most potent of these is the medical socie auxiliary. The Board urges strongly that medical societies gi *full support and constructive advice to the auxiliaries so th* they can carry out their responsibilities with the utmost efficien

The Board of Trustees requests the House of Delegates *support the sense of this statement, and to authorize its dist* bution to the constituent and component societies as the reflecti of the attitude of both the Board of Trustees and the House Delegates.

Narcotic Addiction

Because of the increasing need for an evaluation of the pro lem of narcotic addiction, especially among school children, Board of Trustees has requested the Council on Pharmacy a Chemistry to secure as much information as possible on t subject and has authorized the Secretary and General Mana to contact the Federal Bureau of Narcotics for any suggesti as to how the American Medical Association can assist in solution of this problem.

In addition, a committee will be appointed by the Board *Trustees to study the entire matter.*

Joint Commission for the Accreditation of Hospitals

In September, 1950, the American Hospital Association to action to establish a hospital standardization program in organization of which the medical profession was to have b represented by a committee of six, three to have been appoin by the American College of Physicians and three by the Ame can College of Surgeons. As reported to the House of Delega in June, 1951, the Board of Trustees, recognizing that such program would be of direct concern to the entire medical p fession, took steps to bring to the attention of the Ameri Hospital Association its vital interest in the matter and reques that action implementing the program be deferred.

There followed a series of meetings between representati of the American Medical Association, the American Hosp Association, the American College of Surgeons and the Am can College of Physicians, as a result of which a Joint Comm sion for the Accreditation of Hospitals was recommended. House of Delegates at the June *meeting* approved the act of the Board of Trustees and authorized it to continue neg ations to the end that such a commission be established. A subsequent *meeting* of representatives of the four organizatio the representatives of the American Medical Association, act on instruction from the House of Delegates, requested a chan in the Commission so as to give the American Medical As ciation a proportionately greater representation. The other me bers of the committee, however, expressed the view *that* number of representatives from the American Medical Asso ation and that from the American Hospital Association should equal, particularly since the other members of the *Commissi* would be appointed by two other professional organizations, merican College of Physicians and the American College of urgeons. Further, the latter two organizations had approved he establishment of the Joint Commission on the basis of the greement previously reached that the Commission would be omposed of six representatives appointed by the American Medical Association, six by the American Hospital Association nd three each by the two colleges. This plan has now been pproved by all four participating organizations, and steps will e taken to put it into effect in the near future.

The Joint Commission will be the final authority for the ccreditation of hospitals, carrying out the standardization proram previously sponsored by the American College of Sureons. The functions of the Commission will be: (1) to formuate standards relating to hospital accreditation; (2) to establish he type and scope of inspections to be made under this proram; (3) to assign responsibility for hospital inspections to the everal participating organizations; and (4) to award certificates f accreditation to qualifying hospitals. Inspections for purposes f hospital accreditation will be made and reported in a uniform nanner by staff representatives of the participating organizaions with the reports to be evaluated and acted on by the Comnission itself. Inspections will be related primarily to the rofessional and administrative aspects of the hospital. They vill not be concerned directly with the hospital's teaching proram. Hospital surveys relating to internship and residency trainng will continue to be carried out by the organizations which ave conducted these programs in the past. The operating exenses of the Commission will be paid by the constituent oranizations on a basis proportionate to their representation on he Commission. The budget for the first year of operation has een tentatively set at $70,000. This amount does not include he costs of the hospital inspection service, which will be the esponsibility of the individual organizations.

It is anticipated that the Association's role in the accreditaion program will be administered through the Council on Medial Education and Hospitals. Additional funds to carry out the rogram will be required depending largely on the extent of esponsibility for hospital inspections which the Council will ssume.

"You and Your A. M. A.," Program

The Council on Medical Service proposed to the Board of rustees that a program having the above title, together with an xhibit, be sent to these state medical associations which desired . The program would consist of some of the officials of the merican Medical Association appearing on a panel with a epresentative of the state association concerned, the panel to be ollowed by a question and answer period. A pilot program was uthorized for the constituent medical associations in four states, ennsylvania, Colorado, Virginia and Indiana. The programs iffer somewhat but in the main the basic features in all are imilar.

These pilot programs were received with such success that it vas thought best to put them on in some other states that had equested them. Consequently it was decided by the Board of rustees in view of the general nature of these programs in vhich all American Medical Association activities are presented, o adopt the following policy:

> The development of any programs designed to inform the medical proession or the public of the over-all activities of the American Medical ssociation is a responsibility of the Board of Trustees and will be carried ut through the Secretary and General Manager. Suitable arrangements hall be made by the Secretary and General Manager to secure participaion by all councils, committees, and departments to assure that their pecific programs are properly and adequately presented to both the proession and the public.

The Journal

Following the action of the House of Delegates by which ubscription to THE JOURNAL was included in the annual dues f members of the Association, the circulation of THE JOURNAL ncreased by many thousands. There are now being printed each veek more than 168,000 copies. Interest in subscriptions, in ddition to those provided for members, is continuing to increase, so that each week there is an addition of as many as our or five hundred names to the mailing list of THE JOURNAL. Study is still being made of possibilities of increasing the foreign irculation, but implementation of the most effective plan has ot been made because of the need for additional study of some f the problems, for example, exchange of foreign currencies.

The recommendations developed from the survey of THE JOURNAL which were reported to the House of Delegates at the Cleveland Session in December, 1950, have practically been completed, although it is planned to continue obtaining from the medical profession expressions of opinion concerning the usefulness and general acceptability of the various sections of THE JOURNAL. The costs involved in preparation and printing are increasing, as are other costs, which raises a factor that must be taken into consideration as each issue is prepared. However, in spite of this problem, it is hoped that from time to time the usefulness of THE JOURNAL will be extended as additional needs are demonstrated.

As the names of thousands of members were added to THE JOURNAL mailing list during 1951, there was seen occasionally evidence of failure to supply THE JOURNAL to qualified members as required under the By-Laws of the Association. This was due in part, unfortunately, to the personnel in the Subscription Department being suddenly faced with an unusually large problem. It is believed that by now most of the work associated with the transferring of names is completed and there should be a minimum of cause for complaint because of failure of a member to receive THE JOURNAL.

An increasing amount of Organization material is appearing in THE JOURNAL. It is the hope of the staff of the Editorial Department of THE JOURNAL to use this medium of drawing more attention to the activities of the various councils, bureaus, and committees of the American Medical Association, so that their work may become better known and the information in their files more widely used.

The number of physicians making use of the Queries and Minor Notes department of THE JOURNAL has greatly increased. The increase of inquiries received in 1950 over 1949 was 50%, and the increase in 1951 over 1950 is 15%. No record is kept of the number of telephone inquires received, many of which, however, are answered by mail. Many inquiries can be answered from material in the files of this department. In other instances it is necessary to refer the inquiries to consultants, whose replies are transmitted to the inquiring physician. Some of the questions and answers thus obtained are prepared for publication in THE JOURNAL so that other users of THE JOURNAL can share this information. Of related interest is the sale of Volume III of "Selected Questions and Answers," the body of which is made up of Queries and Minor Notes that have been published in THE JOURNAL in recent years. So far approximately 2,400 copies of this volume have been sold.

The Medical Literature Abstracts department prepares abstracts from medical literature for this section of THE JOURNAL, a section that is very popular with JOURNAL readers. Abstracts of both domestic and foreign medical articles are published. In addition, the Medical Literature Abstracts department prepares abstracts for the *A. M. A. Archives of Industrial Hygiene and Occupational Medicine.* Members of this department also translate letters from some of THE JOURNAL's foreign correspondents and letters in foreign languages that are addressed to other officers of the Association. The Medical and Surgical Newsletters which are distributed by the Department of State in numerous foreign countries are prepared by this department. The latter service, according to available reports, is well received in foreign countries.

The Medical News section of THE JOURNAL indicates a sustained high level of interest during 1951. For the first nine months of this year, in addition to other items the pages carried announcements and programs of 270 society meetings. This is exclusive of information on programs for hospital seminars, medical lectures, and postgraduate courses. Most winter meetings have not been recorded at the time of preparation of this report. During the winter and early spring months of 1951 it was necessary to select and edit news items very carefully to make the best use of available space in THE JOURNAL. A list of international meetings, their dates and general secretaries was added to THE JOURNAL pages last spring. This feature has become increasingly popular. The death pages have recorded an unusually large number of obituaries of prominent physicians, and notices of 10 deaths of physicians in the armed forces have been published.

Special Journals

During the past year a total of 2,072 scientific articles, case reports, and clinical notes were submitted to the special journals. Of this number 1,564 articles were published and 508 rejected. Of the total number of articles submitted 157 were originally submitted to The Journal of the American Medical Association and later referred to one of the nine special journals.

The annual meeting of the chief editors was held on May 12, 1951, at Association headquarters. At this time material relating to financial status, circulation, advertising, published material and editing style was introduced and discussed by the editors present. Circulation figures for all of the special journals during 1951 compare well with 1950 figures. A slight increase occurred with eight of the journals and a moderate drop in one. A program for increasing circulation of all the journals was recommended and undertaken following the chief editors' meeting of 1950. The campaign for increasing circulation of *A. M. A. Archives of Surgery* through 16,000 advertising letters resulted in the obtaining of approximately 600 new subscriptions. Similar campaigns have been undertaken for *A. M. A. Archives of Internal Medicine* and *A. M. A. American Journal of Diseases of Children* and will be carried out eventually for all the other special journals. A program for increasing advertising income has been under way during 1951. A report from the advertising department indicates that the future of the special journals looks much brighter than it has since 1948. During the first five months of 1951, total income from advertising of all the special journals showed an increase of approximately 20% beyond comparable figures for 1950. It is expected that increased income from circulation and advertising will eventually absorb the present operating deficit.

During 1951, for the benefit of both the subscriber and the author, a firm schedule of publication of all accepted articles in a period of four months or less, has been maintained.

Several changes in physical structure have been made during the past year. These have included newer methods of binding which speed up production and lower production cost, and the enlargement of the printed area of the page which has cut down somewhat on the thickness of the individual numbers without reducing content. The volume index is again included with the June and December number of each volume. This procedure was restored because of mailing difficulties and increased costs of separate mailing of indices.

The special journals have adopted new editorial style changes which are in line with the changes in Journal editorial policy. In the future, style books will be used merely as guides and the author's style will be given preference as long as basic rules of grammatical construction are justified.

During this year progressive changes in several of the journals have included establishment of a new department of editorials in *A. M. A. Archives of Surgery,* a new department of annual reviews and registry of interesting cases in *A. M. A. Archives of Ophthalmology,* a case report section in *A. M. A. Archives of Internal Medicine,* and a section of threshold limit values in *A. M. A. Archives of Industrial Hygiene and Occupational Medicine.* Some increased emphasis has been given to psychiatric papers in *A. M. A. Archives of Neurology and Psychiatry.*

Today's Health

The period covered in this report is from Sept. 1, 1950, through Aug. 31, 1951, and corresponds roughly with the second year of service of the present editor. Progress with relation to the items mentioned in the report for the preceding year are as follows:

The Eastman Research Organization, retained as advisors to the editor by authority of the Board of Trustees proved of definite value in crystalizing and stabilizing the policies of the magazine.

The circulation of *Today's Health* is now frozen (June 5, 1951) at a maximum of 235,000 copies monthly by paper restrictions. Ironically, at this very time, renewal percentages are increasing and it has been necessary for several months to hold over renewals and new orders to the subsequent month to wait for expirations because of inability to put them into effect at once due to the paper shortage.

The change of name from *Hygeia* to *Today's Health* has met with substantial approval, the exception being mainly the professional, the better educated and more intellectual subscribers and the subscribers of long standing who have become attached by habit to the name *Hygeia.*

Advertising revenue for *Today's Health* is slowly but steadi improving and the merchandising plan seems to be beginning show results. It is too early as yet to make any final statemen along this line.

The general financial position of the magazine seems to slowly improving. It is not yet possible to predict what the ope ating expense above revenue will be for 1951, but projectio available at this time would indicate that it will be somewhe between $100,000 and $125,000 as compared with an adjust operating expense above revenue of $202,000 for 1950.

It is certain that the status of *Today's Health* as an education tool through its presence in libraries and schools, in the offices physicians and dentists and its use by health departments a health agencies establishes it as a factor in the national picture health education which cannot be ignored. It is significant that competition has sprung up other than a few digest magazin which are quite different in character and the denomination magazine of the Seven Day Adventists which was establish many years ago. That very fact is in itself evidence that *Toda Health* fills a real need and fills it adequately.

CIRCULATION

The circulation of *Today's Health* during the first six mont of 1951 showed a slight increase over the preceding six mont period. The average net paid circulation per month from Januar through June, 1951, was 221,284 copies, as compared with a average of 219,965 copies per month from July through Dece ber, 1950.

Because there was not sufficient increase in the number of su scribers renewing subscriptions on expiration of the original ter it was necessary to add through direct mail solicitation and agen promotions 76,467 new subscribers in order to maintain the cu tomary monthly average circulation of about 220,000 copies.

Most of the new subscribers to *Today's Health* accepted t special introductory offer of a reduced rate for a trial period six or eight months. However, about 25 per cent of the new ord were received through the efforts of subscription agents and oth organizations, a third of these having been obtained through t work of the Woman's Auxiliary to the American Medical Asso ation. The Auxiliary has been instrumental in promoting the u of *Today's Health* as an integral part of the public relations pr gram of state medical societies, and, in a number of states, cop of the magazine are sent each month to the state and federal leg lators as well as to members of the judiciary and boards of educ tion. For the use of the Woman's Auxiliary, special portab exhibits on *Today's Health* have been created for display annual meetings, state fairs and other large gatherings. Since t first of the year, these exhibits have been used at 30 meeting attracting an audience estimated at more than 25,000 persons.

During the past school year, *Today's Health* has been used a supplementary text book in about 70 high schools and colleg throughout the country. In these schools copies were supplied a pecial bulk rate for quantity orders, so that each pupil could ha a copy of the magazine for his own use. To facilitate classroo discussion of the material, the teachers of these classes receiv each month a list of questions and answers based on articles the issue.

Through exhibits at national conventions throughout the yea *Today's Health* has been introduced to the leaders of vario professional groups. Sample copies of the magazine have be distributed in the last twelve months at the annual and inter sessions of the American Medical Association and at the annu meetings of the American Public Health Association, America Dental Association, National Education Association, America Association of Health, Physical Education and Recreatio American College Health Association, and the American Librar Association.

The number of physicians who subscribe to *Today's Health* ha remained disappointingly constant for the past several years Although only about 15 per cent of the practicing physicians i the United States subscribe to *Today's Health,* a survey mad some time ago indicated that more than 2,000,000 patients rea the magazine each month in their doctor's reception room. If a substantial increase in the number of physician subscribers could be achieved, the magazine would be available to patients in many more waiting rooms, thus providing a greatly augmented circle of readers who are vitally interested in the maintenance of good health.

Standard Nomenclature of Diseases and Operations

The 22 committees for the fourth revision of the Standard Nomenclature of Diseases and Operations have completed their work. Editing process is finished and the publication will be available to hospitals on Jan. 2, 1952.

Major changes in the fourth edition are as follows:

1. The title of the third edition, Standard Nomenclature of Disease and Standard Nomenclature of Operations, is now combined as Standard Nomenclature of Diseases and Operations.

2. In order to establish a correlation between "Standard" diagnoses and equivalents of the International Statistical Classification of Diseases, Injuries and Causes of Death, the International equivalents are included parenthetically in the body of the book and an appendix supplied by which code numbers of "Standard" and the "International List" may be properly cross referenced.

3. The Supplementary Terms lists which were previously distributed throughout the several sections in the body of the book are now grouped.

4. The section on Eponyms which appeared in the third edition is now combined with the general index.

5. The Disease index and the Operations index are placed consecutively. Both now appear at the back of the book immediately following the Nomenclature of Operations.

6. Page size has been enlarged to accommodate the increased amount of material without materially augmenting the thickness of the volume.

7. The index is completely revised and direct page references are given to specific entities.

Scientific knowledge of recent years has required many changes in the scientific material presented. In this revision, changes have included a complete revision of the Psychobiologic Unit, the section on Diseases of the Hemic and Lymphatic Systems and the etiologic section on Tumor terminology. Revisions of these sections represent a work of close collaboration between the Standard Nomenclature committees and editors with nomenclature committees of the various national organizations concerned.

The third revision was reviewed thoroughly and approximately 5,800 changes were made which represent additions, deletions or consistency changes. In addition to the work on revision of the Nomenclature, approximately 2,500 queries relative to nomenclature problems have been received and answered during the past year.

In January and June, 1951 standard nomenclature was taught at five day institutes for medical record librarians sponsored jointly by the American Hospital Association and the American Association of Medical Record Librarians. Standard nomenclature classes were also conducted by Mrs. Adaline C. Hayden, Associate Editor of Standard Nomenclature of Diseases and Operations, at meetings in Kentucky, Indiana, Iowa, Mississippi, and Wisconsin.

It is expected that plans for a fifth revision and methods for proper handling of interval nomenclature problems will be considered immediately after release of the fourth edition.

American Medical Directory

The Eighteenth Edition of the American Medical Directory was completed in May, 1950. On previous editions, the average total sale was about 8,000 copies; on the 1950 edition more than 18,500 copies have been sold, and by the time the 1952 edition is available the supply of the 1950 edition no doubt will have been exhausted.

The increase in the volume of sale is attributed to the fact that eight years elapsed between the publication of the Seventeenth, 1942, and the Eighteenth, 1950, edition. During this interval there was also an unprecedented shifting of physician population because of war conditions, stimulating the desire for an up to date directory of physicians. A more normal demand for the 1952 edition is anticipated, and the tentative press run of 10,000 copies will probably satisfy the demand for this edition. A comparison of the sale of the last two editions, indicates the following distribution of copies:

Type of Subscriber	Eighteenth Edition (1950) %	Seventeenth Edition (1942) %
Physicians	54	36
Hospitals, Clinics	18	22
Commercial Organizations	12	18
Insurance Companies	3	6
Libraries	2	2
Federal Agencies	2	4
Medical Schools	2	3
Miscellaneous	7	9
	100%	100%

Although the 1950 edition will be a sell-out, the income derived from the sale of copies will not be sufficient to cover the cost of publication. Income from the Directory Report Service, a supplementary service furnished semimonthly on a subscription and service-fee basis to large mailers of circular material, has helped to defray some of the expense of maintaining the records of the Directory Department. However, because of the demands made on the Department for information concerning physicians, demands made by practically every Council, Bureau, and Department of the Association as well as by other official bodies, commercial and philanthropic organizations, government agencies, and the general public, the income received for the Department's publications cannot cover the costs of operation, especially in view of the increasing cost of clerical help, postage and printing services. It is conservatively estimated that, during an average year, the information section of the Directory Department handles more than 15,000 telephone inquiries and at least 5,200 mail inquiries concerning physicians. In addition approximately 7,000 membership applications are checked annually for the Secretary's Office; in the past nine-month period, license applications for 3,576 physicians have been processed for the Council on Medical Education and Hospitals and 1,029 applications have been checked for five of the examining boards in a medical specialty. The Department routinely verifies data on authors, participants in meetings and conferences, potential advertisers and correspondents for various headquarters' activities.

As is customary after a Directory is printed, the type from the 1950 edition has been saved and, at the end of 1950 and through the first half of 1951, information on the various changes made in the Directory records has been sent to the printer so that necessary revisions and editions could be made in the standing type.

As of Oct. 1, 1951, biographic information on 15,840 new physicians has been added to the Directory records and 82,099 changes of address have been recorded. Of this number, 28,349 were local changes and 48,757 were changes from one city to another. Because of death, 7,035 names of physicians have been deleted.

It had been originally planned to issue the Nineteenth Edition of the Directory in the spring of 1952. The edition has been delayed, however, because of the necessity of correlating the records of the Directory Department with those of the Membership Department concerning the current membership status of physicians as indicated by the reports of the various state medical associations. However, it is hoped that a new Directory will be published and ready for sale late in the fall of 1952.

Library

Work on reorganization of the book collection of the Library has progressed this year. Every item with a publication date prior to 1940 was evaluated in relation to its usefulness to the Library and the headquarters staff. As a result a large number of books were withdrawn as unsuitable for the purpose of maintaining an up-to-date and workable collection. This material was offered to various departments and individuals in the American Medical Association building and then to other libraries. After this elimination of books was completed, the remaining publications were organized into a more logical and convenient arrangement. Recataloging of the entire collection is in progress at present, and rebinding and acquisition of literature in certain fields are in prospect.

The reference service continues to be in demand. The number of package libraries requested showed an increase of about 100 over last year bringing the total to almost 2,150. New borrowers, including members of the Student American Medical Association, frequently asked for this service. Material on cortisone and adrenocorticotropic hormone was in constant demand. Blocking of the stellate ganglion proved a topic of special interest, but as usual the bulk of the requests dealt with such subjects as cardiovascular diseases, gastrointestinal conditions, pregnancy, tumors, diabetes mellitus, multiple sclerosis, the kidney and the liver. The Periodical Lending Service circulated approximately 12,000 journals.

During the year a number of borrowers came in person to consult the files, among them visiting doctors from all parts of the world. Most of the work, however, is handled by letter and by telephone. It is estimated that at least twenty inquiries are answered each day, in addition to the inquiries for package library service. Many of these requests entail a long search which taxes all of the resources of the library.

Indexes to the three current volumes of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION were compiled in the Library as usual. For almost thirty years a cumulated file of cards from these indexes has been maintained. It was decided to close this file with the year 1950, and start a new cumulation which will make the recent material more accessible.

During the year card files of periodicals, arranged by country and by subject respectively, have been organized to aid in answering frequent inquiries. Under the direction of the Editor of THE JOURNAL, a complete survey of all exchanges with THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION was made, and an information file on national medical societies throughout the world and their publications is in preparation.

Quarterly Cumulative Index Medicus

Two volumes of the Quarterly Cumulative Index Medicus have been issued this year: Vol. 46 (July-December 1949) was completed in February, and Vol. 47 (January-June 1950) appeared at the end of August. The new format used in the former caused a number of favorable comments especially regarding legibility; and the slight reduction in size of print for Vol. 47 to reduce the bulk of the book has not affected this feature oticeably.

This latest volume listed 32,171 articles, an increase of 4,605 over volume 46. Approximately one half of these were from foreign language periodicals with about 5,000 in German and 3,900 in French. Italian and Spanish journals accounted for more than 2,300 articles each.

The final processing of copy for Vol. 48 (July-December 1950) is completed, and most of the material has been typed. This issue should be mailed to subscribers early in 1952. Practically all of the cards for the next volume are in file. All English language periodicals are processed currently as soon as they come in, and many foreign language publications receive prompt handling. The card files covering unpublished material are in constant use for reference work both by the Library staff and by visitors to whom they are made available.

Unfortunately this year has brought little improvement in the production schedule of the Index. Every effort has been made to recruit personnel with training and experience in this field without success, so a long period of on-the-job training still continues to handicap the work. However, some gains have been made during the year, and a constant search for likely candidates is maintained.

Report of the State Journal Advertising Bureau

The State Journal Advertising Bureau, formerly known as the Cooperative Medical Advertising Bureau, continues to assist its present membership of 34 state medical journals, representing 39 constituent medical associations, in securing advertising space sales and in servicing accounts by handling most of the details for the convenience of the journal offices.

Through its monthly bulletin, the Bureau offers helpful suggestions as well as current listings of products accepted by the Councils on Pharmacy and Chemistry, Physical Medicine and Rehabilitation and Foods and Nutrition and the Committee on Cosmetics. Acceptance of many products opens up an avenue of further prospects for the journals, all of which follow standards of advertising adopted for the publications of the American Medical Association. It is therefore hoped to maintain present sales in subsequent years and even to increase them. During the past six years, 1946 through 1951, the net sales have exceede $3,639,000.00 representing gross sales exceeding $4,000,000.0 or an average of $666,666.00 per year. For 1951 alone, the gros sales exceed $724,000.00.

The Bureau, operating under the auspices of the Board Trustees of the American Medical Association, functions in be half of the State Journal Group, and all revenue is transmitte to the member journals, less operational costs which amount approximately six per cent. The Bureau is governed by the A visory Committee, which is composed of Drs. Stanley B. Wel Connecticut, Chairman; Julian P. Price, South Carolina; Ca B. Drake, Minnesota; Walter E. Vest, West Virginia, and Fernald Foster, Michigan. Ex officio members of the Adviso Committee are Drs. George F. Lull, Austin Smith and Robert Stormont and Mr. Alfred J. Jackson, Director of the Burea

Council on Rural Health

Believing that it would assist the Committee on Rural Heal in its relations with organizations concerned with rural matte the Board of Trustees has decided to change the status of t Committee to that of a Council of the Board of Trustees. Th action of the Board was taken after the annual report of t Committee on Rural Health was prepared, for which reason th Committee's new status is not mentioned therein.

Report of the Committee on Rural Health

The annual Conference on Rural Health, held annually f the past six years, have served to mould public opinion a crystallize thinking about rural health problems. Each succee ing conference has brought the problem nearer solution. T association of rural citizens, physicians, professional heal workers, extension services of Land-Grant colleges, and edit of agricultural journals has brought to the study a cross-secti of rural and professional leaders not obtainable elsewhe Mutual confidence has grown with the passing years, floweri into a set of objectives useful in state and community hea planning.

There are many groups and agencies interested, and w limited programs, in community health, such as tuberculo poliomyelitis, and cancer. Much that the Agricultural Extensi Service of the Land-Grant Colleges do pertains to health direc or indirectly. In a number of states and in many communit these programs are being brought together by the local lead as a result of their attendance at the national rural health c ferences. The ideal would be to bring all these groups toget into an organization often referred to as a health council, wh affords an opportunity for each to learn what the other is doi and how each can complement the other.

It is often found advisable that at the beginning only a f of these groups be brought together. As they have beco accustomed to working together and obtaining a full und standing of what their respective functions are, they can fr time to time bring in additional groups.

In this connection it is urged that the medical professi come in at the very beginning of such an effort. In many groups during the last fifteen months, it has been urged that steps be taken to begin a council until at least one physician become sufficiently interested to give it attention, guidance a leadership. This recommendation imposes a serious respon bility on physicians. They must be willing to participate active Their passive blessing alone is not enough. While it is necessary that doctors take the initiative or be in the forefro initiative on their part is desirable. Above all else, their acti participation is imperative if sound medical principles are to followed.

Because rural people have generally felt that ther chief heal problem is getting a doctor in the village, it is necessary emphasize the fact that this is only one of several problems th have; it is not necessarily the most important one.

To understand the problem of rural health, attention must called to the difference between health and medical care. Heal is a personal and community responsibility, entirely separate an apart from medical care. If the individual does not understan or neglects his responsibility in this respect, it will be impossib to have enough doctors, nurses or hospitals to assure good health. It is the individual who must see to it that his family is provided proper diets, live in sanitary and safe surroundings, and utilizes the skill of physicians in immunizing themselves against the preventable diseases. In a free enterprise society the physician is helpless unless the public is educated to these facts. The task of educating people is a long process and should be so recognized by all who are interested in the problem.

The local health council affords the best channel to teach alth rules to the citizen. Therefore, it is essential that the ctors come in at the beginning of council organization and sist the lay groups in developing the kinds of educational ograms that will help them to understand their personal and mmunity responsibility in health and its relationship to good edical care. It is recommended that the American Medical ssociation set up a long time program in this field. The pro- am should be broad and flexible to fit any community and med at getting the cooperation of the organizations now work- g in rural educational work. The last fifteen months of work ave clearly shown that nearly all of these agencies and organi- itions are eager to do something, but that they have not clearly iderstood what they can or should do. They need a community earing house for activities.

Another challenging opportunity is for the lay groups and e medical profession to clarify in the minds of the rural lay iblic the difference between the cost of medical care and the ist of illness. A rural family which receives a bill for hospital id other services is inclined to charge the whole matter to the ctor. Since hospital costs are rising sharply, this is of grow- g importance. The cost of the service rendered by the doctor confused with the other costs incident to illness. Any ogram outlined by the American Medical Association should clude this phase of education. The whole field of prepayment surance should be emphasized along with careful study of the imber, size, and location of hospitals. Farm people are more fficult to reach with prepayment programs, because they do ot work in groups as factory or store employees. They are a eater burden to the insurance carrier because they have a eater backlog of untreated pathology, they do not carry in- istrial insurance for the large incidence of accidental injury, or are the workers screened for physical deficiencies at the ginning of employment. A higher premium rate is acceptable rural people when these factors are properly presented to em.

In the case of size, number, and location of hospitals, main- nance costs and overhead on these institutions needs to be iderstood. Costly mistakes have been made in some of the eas of the country, and this experience must be available in irther planning.

In all of the 33 states visited this past year, much good work going on, but in all of them, many problems exist.

It is suggested that consideration be given to the following ints:

1. That a long-time, flexible program be outlined by the ational Committee on Rural Health and be assured support by e American Medical Association.

2. That the national Committee's policy of holding annual iral health conferences be continued.

3. That local physicians and county medical societies take itiative and leadership in lay efforts to improve rural health.

4. That rural people and their institutions be helped to under- and the difference between health and medical care and the lationship of the two, and furthermore that they understand here the responsibilities for each rests.

5. That the factors of nutrition, environmental sanitation, and nmunization be fully appreciated as under-girding supports to good health program.

6. That the lay groups be helped in their understanding of a ommunity's relationship to the doctor. (In turn, his relationship nd responsibility to the community should be made clear at ome point in his training and development. Such things as how get a doctor, determining where one is needed and how to eep him are exceedingly important and are of mutual concern lay people and the medical profession.)

7. That rural people understand more of the cost and maintenance of hospitals. (The use of modern drugs, the antibiotics, early ambulation, improved roads and transportation and other factors must be taken into consideration, as well as the size of area or number of people to be served.)

8. That prepayment insurance programs for rural people be carefully studied and promoted.

9. That rural people be helped to understand the difference between the cost of medical care and the cost of illness.

Among the states holding rural health conferences are Arkansas, Idaho, Indiana, Michigan, Missouri, Montana, North Carolina, North Dakota, Ohio, Virginia, West Virginia, and Wisconsin.

In a few states new and active rural health committees have been formed and have followed precedence by including farmers and health educators, as well as physicians. State medical association rural health committees have cooperated with Farm Bureaus and their affiliate, the Associated Women, in active participation in the program of the Committee on Rural Health. This cooperation with the Grange is also true in some states. In Pennsylvania, Oregon, Washington, and Connecticut, new *state health councils of this type have been formed. Several* states have assembled rural health exhibits for display at state and county fairs, which have proved most successful.

Committee members have made personal contacts with agricultural extension personnel, farm organizations, medical societies, women's auxiliaries, civic organizations, and community groups throughout the country. This includes attendance at a number of state rural health conferences.

During the year approximately 29,000 pieces of literature have been sent out from the headquarters office.

As a result of these contacts, there is a better understanding and cooperation between all the organizations working in the rural health field. This should accelerate the solution of these problems and result in improved health, both urban and rural.

Report of the Washington Office

During the past year the relations of the Washington Office with members of Congress and representatives of the federal bureaus were definitely more intimate and more productive. Because Congress was concerned primarily with emergency legislation and major bills, not many occasions arose for participation of state medical society representatives in dealings with Congress.

The Eighty-Second Congress is still in its first session at this writing but is expected to adjourn in a few days. In January the same lawmakers will be back at the same desks with, generally the same ideas about medical legislation, and waiting for them will be the same bills resting at whatever point they happened to have reached in the legislative process.

GENERAL SERVICES

As in the past, the Washington Office continued to function as an information clearing house, serving Congress and the federal agencies as well as the Association's officers and members. Representatives of the Association testifying before Congressional committees were oriented and advised by the office staff prior to and during their appearance on Capitol Hill. Ten American Medical Association witnesses testified during the year, and the Association filed statements on several other occasions. Almost 8,000 copies of bills were mailed out to interested members, including the members of the Board of Trustees and others who had made inquiries. About 800 other government documents, including committee reports, were mailed on request. It is encouraging to know that more and more physicians are interested enough in what goes on in government to dig through these long documents. In addition many thousands of pieces of literature on the National Education Campaign were sent out in answer to inquiries. Contact was maintained with private associations and agencies to enlist support for the Association on legislation, and speakers were furnished for professional and lay groups.

The office maintained a close liaison with the military depart*ments, the Federal Security Agency, the Veterans Administra*tion and other federal departments to exchange ideas on pending legislation and to interpret correctly proposed and existing regulations. The same relationship was maintained with professional and nonprofessional organizations in the health fields. On request, individual Senators, Congressmen and others were supplied material for speeches, interviews, discussions and questions. This service was not restricted to supporters of the Association's policies.

PUBLICATIONS

During the past year Washington medical news took on special significance. The national emergency resulted in the creation of several new agencies and the expansion of established agencies and departments. Addition of another staff member allowed the Washington Office to keep track of these developments without neglecting its primary function of reporting on legislation.

Office publications are devoted to news reporting, not propaganda. Two publications are issued weekly, the *Bulletin,* devoted to reporting and analyzing legislation, and *Capitol Clinic,* which covers all other medical developments in Washington as well as legislative news not carried in the *Bulletin. Comments,* complementary to the *Bulletin,* is issued irregularly and furnishes special analyses of the more important bills, testimony given by American Medical Association witnesses and action of the Board of Trustees. Five Special Bulletins highlighted particular situations. These were on the National Cancer Institute, the United States Children's Bureau, federal financial participation in public health programs, presumption of service-connected disability by veterans and federal aid to medical education. In addition 20 or more shorter special reports were prepared and mailed out as part of *Capitol Clinic* or the *Bulletin.* Those carried in the *Bulletin* included a digest of the Humphrey subcommittee report on the Veterans Administration Medical Department, a study of legislation for tax relief of professional groups to facilitate purchase of retirement insurance, a breakdown of health items in Federal Security appropriations and a complete analysis of the law increasing pensions for veterans with non-service-connected disabilities. This special coverage in *Capitol Clinic* included a digest of the Dr. Dean Clark report to the Senate on voluntary health insurance, a complete report on Oscar Ewing's proposal for hospitalization at age 65, an analysis of the Surgeon General's Committee's report on federal research grants to medical schools and digests of progressive developments in doctor draft regulations.

All this material is without copyright. Many state and local medical journals reprint part of it regularly, crediting the Washington Office as the source.

The above publications are sent to a single mailing list which now totals 5,000. Every name now on the list is there because the person asked to be put or to be kept there. During the summer the list was screened. After a two-week warning, the names of all those who had not replied by card that they wanted the service and were in a position to make good use of it were removed.

Included on the list are state medical association officers, American Medical Association officers, Association headquarters staff members, some Senators and Representatives and government officials. The staff also writes the Washington news section of THE JOURNAL and, in September, prepared a comprehensive article on enforcement of federal narcotic laws for THE JOURNAL. The office also prepares a weekly summary of new federal legislation for THE JOURNAL.

LEGISLATION

Every bill introduced in Congress is screened, and those with medical implications are followed in their step by step progress. So far in this Congress 183 bills were checked and reported to the profession. Most important of these provided for federal aid to medical, nursing and dental education, federal aid to local public health units, medical programs for veterans; investigation of voluntary health insurance; defense; housing and community facilities bill; including hospitals tax deductions for health insurance payments, proposals to give tax relief to professional groups for purchase of retirement insurance; universal military training and selective service amendments, and armed forces medical care. Following is the status, as of October 1, of legislation of primary concern to the medical profession:

Federal Aid to Medical and Nursing Education.—S. 337, awaiting action in the Senate, has been called numerous times on the unanimous consent calendar but has been passed over each time. In September the committee rewrote the payment schedule, reducing in amount the basic payments and greatly increasing incentive payments for new students. The changes are in the form of a committee amendment and will be considered when the bill is taken up. No hearings have been scheduled on a companion bill in the House. However, H. R. 910, for aid to nursing education only, was the subject of a House hearing.

Prescription Drug Bill.—H. R. 3298, authorizing oral prescriptions and refills, passed the House after elimination of a provision giving the Federal Security Administrator broad powers to determine prescription drugs. S. 1186 still containing this grant of power to the Federal Security Agency administrator, was the subject of Senate hearings in September.

Defense Housing and Community Facilities.—Now Public Law 139 provides for federal loans and grants to stimulate construction of housing and community facilities, including hospitals, in critical, crowded defense areas. Following objection by the American Medical Association and other groups, some safeguards were inserted as a protection against federal control.

Tax Deductions for Voluntary Health Insurance.—Several bills are pending but no hearings. However, Senator Ecton proposed an amendment to the tax bill which would allow deduction of health insurance premiums and most other medical expenses from taxable income. Now only that portion of medical expenses that exceeds five per cent of taxable income may be deducted. The American Medical Association strongly supported the amendment, but it was defeated on the Senate Floor

Ives Proposal to Allow Professional Persons to Deduct Annuity Premiums from Taxable Income.—This failed to pass, bu the American Medical Association and the American Bar Association had the opportunity to do considerable educational worl on the Congress, impressing members with the justice of sucl a plan. The committee has agreed to study the proposal mor fully.

Local Public Health Units Bill.—Without hearings, the committee reported out and the Senate passed S. 445, for feder grants to local public health departments. The House Interstat and Foreign Commerce Committee held hearings, at which th American Medical Association supported the companion bil H. R. 274, providing certain amendments were made. This committee has taken no further action.

School Health Bills.—Five bills were offered in the Hous but none in the Senate, and there was no action.

EMIC.—One Senate bill, S. 1245, and two House bills, H. R 3349 and H. R. 4176, provide federal grants for medical car for wives and infants of servicemen. There was no action, bu the Senate Health Subcommittee has said it will hold hearing The Children's Bureau of the Federal Security Agency is activel promoting this legislation.

National Compulsory Health Insurance.—Two bills are pending in the House, H. R. 27 and H. R. 54, which follow th original Wagner-Murray-Dingell pattern, but none in the Senate. No hearings have been held or scheduled. There are number of other bills to facilitate voluntary health insuranc the most recent being S. 2171, introduced by Senators Hill an Aiken.

Unless enacted before the recess, all of these bills will awaiting Congress when it returns after January 1. The Wa ington Office will watch them and report their progress or l of progress through the Congress.

Government departments, old and new, are experiencing urge for expansion, attributed to the emergency. Not many w badly burt by appropriation cuts. Old and new, the departme and agencies are embarking on new activities, many of whi are of direct or indirect importance in the medical picture.

A large part of the program of the Washington Office for n year will be pointed toward keeping abreast of developments a reporting them as rapidly and as accurately as possible. To h in this, it is proposed to install a news ticker machine, whi will give up-to-the-minute leads.

Report of Committee on Legislation

The Committee on Legislation, organzed in January, 1950, extended its activities during the period covered by this report, Oct. 1, 1950, to Sept. 30, 1951, in order to fulfill more effectively the purposes for which it was created. These purposes, as outlined at the first meeting of the Committee, are: (1) to streamline legislative action so as to get faster and more effective results in Washington; (2) to study and report on legislation introduced; (3) to maintain knowledge of the current status of and take suitable action on bills previously introduced; (4) to assure the dissemination of information to local and state medical societies with respect to current legislation and actions recommended; and (5) to recommend the names of physicians for the presentation of testimony to congressional committees.

During the period in question the Committee has had five meetings, has analyzed 129 legislative proposals, and has recommended policy positions on 110 of these proposals to the Board of Trustees.

It is apparent from the above figures that there has been an increasing number of bills introduced in the Congress which are of interest to and which affect the medical profession. The Committee, by virtue of frequent meetings, many hours of deliberation and the cooperation of the Washington Office and the Bureau of Legal Medicine and Legislation, has been able to formulate recommended positions on these measures and to determine which of the bills require the active support or opposition of the American Medical Association.

Following is a list of the bills on which either oral or written statements were presented, together with the names of the witnesses:

82D CONGRESS

S. 1, amended (War Manpower bill):

Statement of Dr. Stockton Kimball, Chairman, Joint Committee on Medical Education in Time of National Emergency—Jan. 30, 1951.

Testimony of Dr. George F. Lull on Section 23—Jan. 30, 1951.

S. 349 (H. R. 1272) (Defense Housing and Community Facilities and Services Act of 1951):

Statement of Dr. W. B. Martin before the Senate and House Committees on Bankng and Currency—Feb. 7, 1951.

S. 1328 (Survey of Sickness):

Written statement by American Medical Association to the Subcommittee on Health of the Senate Labor and Public Welfare Committee—Aug. 23, 1951.

H. R. 274 (Local Public Health Unit bill):

Statement submitted on behalf of the American Medical Association by Dr. Gunnar Gundersen to the Committee on Interstate and Foreign Commerce, House of Representatives—April 11, 1951.

H. R. 348 (Barbiturate bill):

Written statement by American Medical Association to the Committee on Ways and Means of the House of Representatives—April 12, 1951.

H. R. 910 (Nursing Education Act of 1951):

Statement of Dr. W. B. Martin on behalf of the American Medical Association before the Interstate and Foreign Commerce Committee of the House of Representatives —Sept. 13, 1951.

H. R. 3298 (S. 1186) (Drug bill):

Statement of Dr. W. B. Martin before a subcommittee of the Senate Committee on Labor and Public Welfare—Sept. 11, 1951.

H. R. 4528 (H. R. 4675) (Transportation of Fireworks):

Written statement by American Medical Association to the Committee on the Judiciary of the House of Representatives—Sept. 19, 1951.

In an effort to arrive at the soundest possible position on gislation and in order to utilize available technical advice and idance to the fullest extent, the Committee has initiated the ocedure of referring new legislation to each interested council, bureau or department of the Association. It is intended that written and oral comments will be presented by them to the Committee on Legislation as such bills are considered.

The Committee has establshed liaison with the committees on legislation of the state and territorial medical associations in an effort to obtain their support and to furnish them with up-to-date information regarding national legislation and the position of the Association with respect thereto. In order to facilitate the dissemination of this information, a monthly legislative review is being prepared and distributed by the Committee, showing the bills introduced each month, the interested council, bureau or department of the Association, previous similar or identical bills introduced and the position adopted by the Association on such earlier proposals. An arrangement has also been made to publish in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION after each meeting of the Committee on Legislation the actions of the Committee on specific bills, as approved by the Board of Trustees.

Report of the Committee on Medicolegal Problems

The Committee on Medicolegal Problems was created by the Board of Trustees at its meeting held on May 28, 1950. This is the second report on the activities of the committee, the first having been incorporated in the Report of the Bureau of Legal Medicine and Legislation, the Director of which is Secretary of the committee.

When the committee was formed it was intended that its membership should be sufficiently diversified in expertness and interests as to constitute an effective agency for dealing with a wide variety of medicolegal problems. It was felt that the existence of a single broadly representative committee of this kind, empowered to appoint special ad hoc subcommittees and to designate special consultants to assist it, would make the existence of a separate standing committee for each different kind of medicolegal problem unnecessary. Thus, as new medicolegal problems arise they may be referred to this committee, which will either deal with them directly or will seek the advice of special subcommittees or consultants in order to prepare its reports and recommendations. Two new members were added to the committee during the past year, one an expert in psychiatry and the other in pathology, to enable the committee to make certain needed expansions in its activities.

The committee found that each of the following subjects deserves a fact-finding survey and the initiation of an active program for improving the manner in which medical knowledge and skill are utilized in the administration of justice:—

1. The cause and prevention of allegations of medical malpractice.
2. The scientific and medicolegal status of tests for the recognition of alcoholic intoxication.
3. The scientific and medicolegal status of blood tests in disputed paternity cases.
4. The teaching of legal medicine and medical jurisprudence in medical schools.
5. The status of the coroner system and the medical examiner sytem in the United States.

During the year the committee held two meetings at which the chairmen of the various subcommittees reported progress in the discharge of their assignments.

Subcommittee on the Cause and Prevention of Allegations of Medical Malpractice.—A report entitled "Malpractice and the Physician" was prepared by the chairman of this subcommittee, approved by the full committee, and published in THE JOURNAL for September 1. The reception of this report has been most gratifying. Within three weeks after its publication, requests were received for approximately 5,000 reprints. An exhibit on the subject has been made available by the committee for use by constituent associations and was presented recently at a meeting of the Connecticut State Medical Society where it was well received. It will be presented at the Los Angeles meeting of the Association.

Subcommittee on the Scientific and Medicolegal Status of Tests for Alcoholic Intoxication.—The chairmen of this subcommittee reports that work has been commenced on the preparation of a comprehensive report dealing with the status of legislation and to interpret correctly proposed and existing regulations. The same relationship was maintained with professional and nonprofessional organizations in the health fields. On request, individual Senators, Congressmen and others were supplied material for speeches, interviews, discussions and questions. This service was not restricted to supporters of the Association's policies.

PUBLICATIONS

During the past year Washington medical news took on special significance. The national emergency resulted in the creation of several new agencies and the expansion of established agencies and departments. Addition of another staff member allowed the Washington Office to keep track of these developments without neglecting its primary function of reporting on legislation.

Office publications are devoted to news reporting, not propaganda. Two publications are issued weekly, the *Bulletin*, devoted to reporting and analyzing legislation, and *Capitol Clinic*, which covers all other medical developments in Washington as well as legislative news not carried in the *Bulletin*. *Comments*, complementary to the *Bulletin*, is issued irregularly and furnishes special analyses of the more important bills, testimony given by American Medical Association witnesses and action of the Board of Trustees. Five Special Bulletins highlighted particular situations. These were on the National Cancer Institute, the United States Children's Bureau, federal financial participation in public health programs, presumption of service-connected disability by veterans and federal aid to medical education. In addition 20 or more shorter special reports were prepared and mailed out as part of *Capitol Clinic* or the *Bulletin*. Those carried in the *Bulletin* included a digest of the Humphrey subcommittee report on the Veterans Administration Medical Department, a study of legislation for tax relief of professional groups to facilitate purchase of retirement insurance, a breakdown of health items in Federal Security appropriations and a complete analysis of the law increasing pensions for veterans with non-service-connected disabilities. This special coverage in *Capitol Clinic* included a digest of the Dr. Dean Clark report to the Senate on voluntary health insurance, a complete report on Oscar Ewing's proposal for hospitalization at age 65, an analysis of the Surgeon General's Committee's report on federal research grants to medical schools and digests of progressive developments in doctor draft regulations.

All this material is without copyright. Many state and local medical journals reprint part of it regularly, crediting the Washington Office as the source.

The above publications are sent to a single mailing list which now totals 5,000. Every name now on the list is there because the person asked to be put or to be kept there. During the summer the list was screened. After a two-week warning, the names of all those who had not replied by card that they wanted the service and were in a position to make good use of it were removed.

Included on the list are state medical association officers, American Medical Association officers, Association headquarters staff members, some Senators and Representatives and government officials. The staff also writes the Washington news section of THE JOURNAL and, in September, prepared a comprehensive article on enforcement of federal narcotic laws for THE JOURNAL. The office also prepares a weekly summary of new federal legislation for THE JOURNAL.

LEGISLATION

Every bill introduced in Congress is screened, and those with medical implications are followed in their step by step progress. So far in this Congress 183 bills were checked and reported to the profession. Most important of these provided for federal aid to medical, nursing and dental education, federal aid to local public health units, medical programs for veterans; investigation of voluntary health insurance; defense; housing and community facilities bill; including hospitals tax deductions for health insurance payments, proposals to give tax relief to professional groups for purchase of retirement insurance; universal military training and selective service amendments, and armed forces medical care. Following is the status, as of October 1, of legislation of primary concern to the medical profession:

Federal Aid to Medical and Nursing Education.—S. 337, awaiting action in the Senate, has been called numerous times on the unanimous consent calendar but has been passed over each time. In September the committee rewrote the payment schedule, reducing in amount the basic payments and greatly increasing incentive payments for new students. The changes are in the form of a committee amendment and will be considered when the bill is taken up. No hearings have been scheduled on a companion bill in the House. However, H. R. 910, for aid to nursing education only, was the subject of a House hearing.

Prescription Drug Bill.—H. R. 3298, authorizing oral prescriptions and refills, passed the House after elimination of a provision giving the Federal Security Administrator broad powers to determine prescription drugs. S. 1186 still containing this grant of power to the Federal Security Agency administrator, was the subject of Senate hearings in September.

Defense Housing and Community Facilities.—Now Public Law 139 provides for federal loans and grants to stimulate construction of housing and community facilities, including hospitals, in critical, crowded defense areas. Following objection by the American Medical Association and other groups, some safeguards were inserted as a protection against federal control.

Tax Deductions for Voluntary Health Insurance.—Several bills are pending but no hearings. However, Senator Ecton proposed an amendment to the tax bill which would allow deduction of health insurance premiums and most other medical expenses from taxable income. Now only that portion of medical expenses that exceeds five per cent of taxable income may be deducted. The American Medical Association strongly supported the amendment, but it was defeated on the Senate Floor.

Ives Proposal to Allow Professional Persons to Deduct Annuity Premiums from Taxable Income.—This failed to pass, but the American Medical Association and the American Bar Association had the opportunity to do considerable educational work on the Congress, impressing members with the justice of such a plan. The committee has agreed to study the proposal more fully.

Local Public Health Units Bill.—Without hearings, the committee reported out and the Senate passed S. 445, for federal grants to local public health departments. The House Interstate and Foreign Commerce Committee held hearings, at which the American Medical Association supported the companion bill H. R. 274, providing certain amendments were made. This committee has taken no further action.

School Health Bills.—Five bills were offered in the H but none in the Senate, and there was no action.

EMIC.—One Senate bill, S. 1245, and two House bills, H. 3349 and H. R. 4176, provide federal grants for medical for wives and infants of servicemen. There was no action, the Senate Health Subcommittee has said it will hold heari The Children's Bureau of the Federal Security Agency is acti promoting this legislation.

National Compulsory Health Insurance.—Two bills are p ing in the House, H. R. 27 and H. R. 54, which follow original Wagner-Murray-Dingell pattern, but none in the S ate. No hearings have been held or scheduled. There ar number of other bills to facilitate voluntary health insura the most recent being S. 2171, introduced by Senators Hill Aiken.

Unless enacted before the recess, all of these bills will awaiting Congress when it returns after January 1. The W ington Office will watch them and report their progress or l of progress through the Congress.

Government departments, old and new, are experiencing urge for expansion, attributed to the emergency. Not many w badly burt by appropriation cuts. Old and new, the departme and agencies are embarking on new activities, many of whi are of direct or indirect importance in the medical picture.

A large part of the program of the Washington Office for n year will be pointed toward keeping abreast of developments a reporting them as rapidly and as accurately as possible. To h in this, it is proposed to install a news ticker machine, whi will give up-to-the-minute leads.

on the development of safety standards for use of pesticides, the evaluation of remedial measures and the standardization of nomenclature.

During the past year the committee made arrangements to evaluate a possible new antidote for a pesticidal chemical which is widely used in agriculture. It also appointed subcommittees on nomenclature and on the development of a poisoning reporting system. The subcommittee on the nomenclature has assisted the federal government's Interdepartmental Committee on Pest Control in the selection of generic names for pesticides. It has also provided liaison between the Council on Pharmacy and Chemistry and other interested groups on those items which involve both drug and pesticide nomenclature. The subcommittee on the development of a poisoning reporting system developed a preliminary notification form for the initial exchange of information on pesticide poisonings. This form is being used to integrate data by providing a means for the immediate follow-up and evaluation of poisoning cases by those groups which have the facilities to conduct such inquiries.

MEETINGS

The Council holds an annual meeting to discuss or review important problems in therapeutics, to consider modifications and extension of its activities and procedures, and to receive reports from its various standing committees. During the meeting last year considerable time was devoted to considerations involving revision of the Council rules. The regular activities of the Council, including such matters as the consideration of products, publications and reports, are conducted by means of a biweekly bulletin.

CORRESPONDENCE

Several thousand inquiries pertaining to drugs and therapeutics are answered by the Council office each year. Most of these inquiries come from practicing physicians. The remainder are received from persons or organizations interested in securing information relating to particular drugs and therapeutic procedures. This service is further augmented by numerous telephone inquiries answered directly by professional personnel in the Council office. The bulk of the correspondence is associated with activities related to the drug acceptance program and to the various publications issued or sponsored by the Council.

COLLABORATION

The Council endeavors to collaborate with other groups and organizations on problems of mutual concern or interest. An exchange of valuable technical information is facilitated through liaison with other organizations and scientific groups. Every effort has been made to provide informative responses to inquiries from the World Medical Association on matters relating to drugs and therapeutics.

Information is regularly exchanged between the Council and the revision committees of the U. S. Pharmacopeia and National Formulary, the Federal Food and Drug Administration and the U. S. Public Health Service. Not infrequently information relating to the nomenclature as well as the tests and standards for new medicinal agents is exchanged with groups or agencies in foreign countries.

EXHIBITS

The Council office occasionally assists in the preparation of scientific exhibits on subjects pertaining to the diagnosis, prevention or treatment of disease through the use of medicinal agents. A pictorial means of disseminating authoritative information pertaining to therapeutics is often most useful. An exhibit portraying the useful services which the Council provides for the medical profession has been prepared and is now being shown at various meetings.

COMMITTEE ON RESEARCH

The Committee on Research, as a standing committee of the Council on Pharmacy and Chemistry, has engaged in activities which may be conveniently divided into four spheres: (1) investigations under committee contracts; (2) cooperative investigations; (3) educational and informational services, and (4) grants-in-aid.

Investigations Under Committee Contracts.—During the past year, investigations on the khellol alkaloids have been completed and a final report submitted. The investigation of buffered and adjusted ophthalmic solutions should be completed before the end of the current year. Contracts are about to be signed between fourteen firms and an investigator for a study of the newer anticoagulant drugs and a search for a more satisfactory method for standardization of thromboplastin. Approved for committee sponsorship is a study of the effect of early feeding of meat proteins upon the growth and development of infants.

Cooperative Investigations.—For the past three and one half years the Subcommittee on Steroids and Cancer has been integrating the efforts of 45 centers in a study on the influence of steroid hormones on cancer of the breast, bladder, ovary, uterus, and bone. This year 48 investigators attended a biennial meeting of the subcommittee on April 23 and 24. This cooperative program has been so successful that the Committee on Research has recently approved an extension of the activity of the Subcommittee on Steroids and Cancer to embrace problems relative to the use of steroid hormones and allied substances in metabolic diseases, sterility and pregnancy wastage. Fifteen pharmaceutical firms are supporting this cooperative investigation.

Educational and Informational Projects.—Under the direction of the Committee on Research, a status report on Krebiozen was prepared and sent to the Council on Pharmacy and Chemistry for publication in THE JOURNAL. Articles on Roentgen and Steroid Hormone Therapy in Mammary Cancer Metastatic to Bone and Current Status of Hormone Therapy of Advanced Mammary Cancer were published in THE JOURNAL Nov. 18, 1950, and June 2, 1951, respectively.

Grants-in-Aid.—As the successor to the Therapeutic Research Committee, the Subcommittee on Grants-in-Aid of the Committee on Research has approved the following grants since Jan. 1, 1951; in some cases an unexpended balance remains or the work is not yet completed. These grants were made by the Therapeutic Research Committee. They are listed after the grants issued for the current year.

Grant 2: Percival Bailey, University of Illinois, to investigate stereotaxic apparatus for use on human brains, $500.

Grant 3: Sumner Kalman, Stanford University School of Medicine, to investigate the prolongation of inhibitory effects of steroids on neoplasms, $200.

Grant 4: Charles D. Hendley, Tulane University School of Medicine, to investigate the mechanism whereby circulatory changes affect visual functions, usefulness of visual tests in diagnosis of cardiovascular disorders, and evaluation of effectiveness of therapeutic procedures, $500.

Grant 5: Joseph R. DiPalma, The Hahnemann Medical College and Hospital, to compare the effects of various compounds against quinidine for anti-fibrillatory potency to determine if an effective substitute for quinidine can be found, $200.

Grant 6: Theodore Koppanyi, Georgetown University School of Medicine, to evaluate the effects of intravenous injections of cholinesterases, $400.

Grant 7: Robert S. Litwak, Boston University School of Medicine, to investigate an experimental approach to stenotic lesions of the semilunar valves and their homograft replacement, $500.

Grant 8: James C. Rice, University of Mississippi School of Medicine, to determine the effect of sodium ferricyanide as an antagonist to the action of certain musculotropic poisons, $250.

Grant 9: Miriam E. Simpson and Gertrude Van Wagenen, University of California School of Medicine and Yale University School of Medicine, to study the pituitary gonadotropins in the Rhesus monkey (Macaca Mulatta), $500.

Grant 10: Clinton H. Thienes, University of Southern California School of Medicine, to study the effect of nicotine on the metabolism of the brain, $500.

Grant 11: Harold C. Wiggers, Union University, Albany Medical College, to investigate the production and study of mitral stenosis and/or insufficiency by insertion of substitute plastic valves in dog hearts, $500.

Grant 12: Alan D. Bass and Henry DiStefano, State University of New York Medical College at Syracuse, to investigate alterations in tissue nucleoprotein patterns following administration of therapeutic agents (e.g. morphine, insulin, colchicine), $200.

Grant 13: Edward L. Corey, University of Virginia School of Medicine, the electromyographic study of the human urinary bladder, $400.

Grant 14: T. S. Danowski, University of Pittsburgh School of Medicine, the exploration of the mechanical characteristics and the clinical utility of the Alwall type artificial kidney, $400.

Grant 15: Andres Goth, Southwestern Medical School of the University of Texas, the experimental re-evaluation of analeptics in the treatment of barbiturate intoxication, $400.

Grant 16: A. Clark Griffin, Stanford University School of Medicine, to investigate the alleviation of the symptoms of nitrogen mustards by cysteine and thiourea, $400.

Grant 17: Keith S. Grimson, Duke University School of Medicine investigate the treatment of aneurysms of the aorta, $400

Collaboration with Committee on Cosmetics

The Chemical Laboratory cooperates with the Committee on Cosmetics in the latter's acceptance program. The Laboratory's work entails investigation of the chemical aspects of the product. The results of these examinations and opinions concerning claims made for the product are forwarded to the committee for consideration. Fifty-eight finished products and a considerable number of their components were studied during the past year.

Collaboration with Other Departments of Association

Considerable time was spent in an advisory capacity to other departments of the American Medical Association. These included examination of products for several Councils and Bureaus, and aid to the Editorial Department on chemical statements and nomenclature which appeared in articles to be published in The Journal, to the Library of the Association in classifying entries of chemical and pharmaceutical nature for the Quarterly Cumulative Index Medicus and to the Advertising Committee by examining appliances and test kits considered for advertising and reviewing chemical statements to appear in advertising copy. The laboratory cooperated closely with the Committee on Publications of the Council on Pharmacy and Chemistry in preparation of "New and Nonofficial Remedies" for publication.

Special Problems

Examination of the many products by the laboratory often reveals the desirability of carrying on investigations of a more fundamental nature which frequently develop into relatively long term projects. Among those now being studied are some which had been started several months ago, such as the in vitro comparison of the effectiveness of various antacids and the establishment of criteria for enteric coatings. A new problem under way is a study of the effectiveness of filters in removing tars, nicotine and other constituents from tobacco smoke.

The laboratory is investigating new and advanced analytical technics regarding their applicability to its immediate problems. It has done some investigational work for certain medical groups in which the problems were of general interest to the medical profession.

The laboratory during the past year has corresponded and worked collaboratively with the United States Pharmacopeia, ational Formulary, Food and Drug Administration, American Dental Association and other agencies. It also reviewed for The Journal 45 books of a chemical nature which are of interest to the physician and answered numerous letters of inquiry concerning the chemistry of drugs.

MICROBIOLOGIC SECTION

During the past year the Microbiologic Laboratory has been engaged chiefly in the examination of products, submitted for inclusion in New and Nonofficial Remedies, for which sterility claims have been made by the manufacturer. Approximately one hundred such products have been tested for sterility by methods prescribed by the United States Pharmacopeia XIV and the United States Food and Drug Administration and by other technics especially applicable to the product under study. Various chemical products for which bactericidal and bacteriostatic claims were made have also been tested. In addition to these examinations, several mechanical devices were tested to determine the validity of the manufacturers' claims.

The Microbiologic Laboratory has also cooperated with other departments and councils of the American Medical Association on bacteriologic problems concerned with advertising, literature and revisions for N. N. R.

This department is now actively engaged in a revision of microbiologic procedures in N. N. R., and in a reconsideration of the problem of the cold disinfection of instruments.

Report of the Committee on Cosmetics

The Committee on Cosmetics continued its efforts to encourage the scientific approach in the formulation and manufacture of cosmetics through quality controls and thorough laboratory and clinical investigation. Progress in this direction is most obvious in the number of preparations which have satisfactorily met the requirements of the Committee for acceptance. All products are evaluated on the basis of data on composition, manufacturing controls and advertising claims. Whenever indicated, clinical evaluation of primary irritation and sensitization propensities, toxicologic tests and usuage studies are also required. Accepted products are privileged to display the seal of the committee, which is similar in design to the seals of the scientific councils of the American Medical Association. A list of accepted products appear at intervals in a Report on Accepted Products in The Journal. A pamphlet incorporating all of these reports is under preparation for general distribution.

The committee fosters a better understanding of the need for cosmetics and the health problems which may arise through their use through the dissemination of pertinent information to the medical profession and the public by means of the various mediums available for this purpose. Reports on timely subjects in the cosmetic field are authorized for publication in The Journal and *Today's Health.* More than a thousand inquiries are answered each year by individual letters. The majority of these come from practicing physicians and the scientific personnel of firms manufacturing or distributing cosmetics and allied preparations. The remainder are sent in by persons or organizations interested in the health aspects and the usefulness of cosmetics. Numerous telephone inquiries are answered by members of the professional staff.

An exhibit on cosmetics and dermatitis sponsored by the Committee is available for presentation at medical meetings throughout the country. In addition an electrical transcription on "Cosmetics" is included in the electrical transcription library of the Bureau of Health Education.

During the past year the membership has been enlarged to accommodate the increased scope of activities.

The Committee expresses its gratitude to the various departments at Association headquarters and to the consultants of the Committee who have contributed their valuable services so freely during the past year.

Report of the Council on Physical Medicine and Rehabilitation

In 1951 a physician secretary was added to the personnel of the Council on Physical Medicine and Rehabilitation, and the former Secretary became the Director of Biophysical Investigations. The establishment of a small physical laboratory which will be directed by a physician physiologist was authorized. These changes are designed to assist the Council in continuing, as efficiently as possible, its assigned duties of gathering and disseminating information to aid the medical profession in determining the therapeutic and diagnostic value of devices and methods.

In the course of the year, two of the members, Dr. William Grove and Dr. Walter E. Garrey died. Dr. Arthur L. Watk was elected to succeed Dr. Garey. The appointment of a s cessor to Dr. Grove has not been completed.

PUBLICATIONS

The booklet "Apparatus Accepted" was reorganized or different basis in order that it might be distributed with charge to persons desiring it. Seven articles were adopted published during the year. They were: Suggestions for Prosp tive Purchasers of Electrocardiographs; Emergency Woo Respirator; Minimal Requirements for Acceptable Pure T Audiometers for Diagnostic Purposes; Regulations for thermy Equipment; Hearing Aids and Advertising; Audiome at Higher Frequencies; and The Health Resort in the Mana ment of Chronic Disease.

Approximately 70 pieces of apparatus were submitted consideration during the year. Forty-three pieces of appara were reported on in The Journal in 1951.

COUNCIL ADVISORY COMMITTEES

American Health Resorts.—The Advisory Committee American Health Resorts, in keeping with its task of investig ing American Health Resorts, gave consideration to applicatio from four health resorts which were submitted to the Coun in *1951.*

Artificial Limbs.—The article, "Certification Program Adopt by Prosthetic and Orthopedic Appliance Industry," to appear The Journal or a special monthly publication of the America Medical Association, was adopted by this committee and t Council is going forward with the program.

Audiometers and Hearing Aids.—With the help of this Committee, "Minimal Requirements for Acceptable Pure Tone Audiometers for Diagnostic Purposes," "Audiometry at Higher Frequencies" and "Hearing Aids and Advertising" were published. Twenty hearing aids were submitted, and 13 were accepted; the remainder are undergoing consideration. Five audiometers were submitted, and three were accepted; the other audiometers are undergoing consideration. This committee held its two day annual meeting in July, meeting jointly on one day with representatives of manufacturers of audiometers and hearing aids.

Clinical Thermometry.—This committee of the Council is continuing its survey of problems related to clinical thermometers.

Devices for Fertility and Infertility.—The name of the Advisory Committee on Contraceptive Devices was changed to Advisory Committee on Devices for Fertility and Infertility. This committee has continued to serve the Council through its consideration of submitted contraceptive devices.

Education.—The Advisory Committee on Education has continued its active role within the Council by assisting in the encouragement and development of programs designed to increase the number of physiatrists, physical therapists and occupational therapists. In these activities the Council cooperated with the Council on Medical Education and Hospitals as well as the American Congress of Physical Medicine. A questionnaire, "Teaching Program in Physical Medicine," was mailed to the deans of medical schools. Seventy replies were received. The Subcommittee of the Committee on Education met in 1951.

Electrocardiographs.—Two instruments were submitted to the Council in 1951, and one was accepted. This group met in Atlantic City in June during the annual session. The Advisory Committee is responsible for the publication of the article, "Suggestions for Prospective Purchasers of Electrocardiographs."

Electroencephalography.—One instrument was submitted to the Council in 1951.

Ionizing Radiations.—The name of the Advisory Committee on Roentgen Rays and Radium and the Medical Aspects of Atomic Energy was changed to the Advisory Committee on Ionizing Radiations.

Ophthalmic Devices.—The Advisory Committee on Ophthalmic Devices has continued to advise the Council on visual testing apparatus and the use of beta radiation in the field of ophthalmology and has submitted "Minimal Requirements for Beta Radiation Ophthalmic Applicators" to the Council.

Respirators.—Two respirators were submitted to the Council and two were accepted in 1951.

OTHER ACTIVITIES

The manufacturers of resuscitators and inhalators met in Atlantic City with the representatives of the Council and discussed "Tentative Minimal Requirements for Resuscitator and Inhalator Equipment." One resuscitator and three inhalators were accepted in 1951.

The manufacturers of infant incubators met in Atlantic City with representatives of the Council to discuss the establishment of "Minimal Requirements for Infant Incubators."

Demonstrations and exhibits on subjects relating to physical medicine, as well as other applications of physics to medicine, have been prepared for medical and lay audiences in various sections of the United States. The Council has cooperated with the Bureau of Exhibits in preparing and setting up demonstrations and exhibits. Two of the most noteworthy of these exhibits were "Atomic Energy and Radiation Injury" and "Noise in Industry." The Council has cooperated with the Committee on Medical Motion Pictures in reviewing new educational films and with the editorial staff in preparing articles and reviews.

Report of the Council on Foods and Nutrition

The past year has seen the Council on Foods and Nutrition continue to serve the medical profession in many ways.

FOOD ACCEPTANCE AND ADVERTISING

The food acceptance program of the Council added more than two hundred items to the list of accepted foods. Reviewing food advertising for accuracy has required an ever-increasing amount of time on the part of the Council members and the Council office. This is due largely to the increase in the number of products that have been reviewed. The Council also examines on request educational food advertising presenting information concerning nutritional or physiological values of classes of foods without reference to any specific brand. A great amount of such advertising has been critically reviewed and in almost every instance the suggestions of the Council have been adopted. This is an excellent illustration of the prestige the Council enjoys with the various food companies and trade and professional organizations interested in the dissemination of accurate nutritional knowledge.

ASSISTANCE TO AUTHORS

The Council continues to make its services available to all groups and individuals having a scientific interest in foods and nutrition. During the year inquiries have been answered from members of the profession, laymen, teachers, and governmental agencies here and abroad.

A considerable amount of time and effort has been expended during the past year in assisting writers who are developing articles on subjects related to foods and nutrition. A considerable amount of additional time has been devoted to the review and criticism of finished articles submitted by authors prior to publication. Articles and books have been reviewed for publishers of popular editions. This is a time-consuming process but an important means of encouraging accuracy. Apparently the Council's best opportunity to promote improved nutrition through the work of lay writers is to supply accurate information to those authors who request it and then to depend on their personal integrity.

CHEMICAL FOOD ADDITIVES

The Council reexamined the concept of a wholesome food and specifically called attention to the importance of insisting on freedom from harmful or potentially harmful nonfood additives. A statement and a short definition were published in THE JOURNAL of June 2, 1951. Because of its basic significance the short definition is reproduced here: A wholesome food "is a product which makes a significant contribution to human dietary requirements and which is clean and free from microorganisms and chemical additives of such quality or in such quantities that they may be directly injurious or result in reduced nutritional quality."

Two other important basic statements in this field were made by the Council. A statement expressing the need for adequate testing of all chemical additives destined for use in foods appeared in THE JOURNAL of June 23, 1951. It was pointed out also that not only should chronic as well as acute toxicity tests be performed but practical methods of analysis should be developed before such substances are permitted in foods.

OTHER REPORTS

Because of recurring interest in the safety of aluminum cooking utensils the Council was requested to give an opinion based on the latest available information. This was published in THE JOURNAL of June 2, 1951. It was the Council's considered opinion that the use of aluminum cooking utensils is in no way injurious to health.

An excellent report on vitamin B_{12} and folic acid in infant nutrition. This was published in THE JOURNAL of July 14, 1951. It is a summary of a conference held at the Massachusetts General Hospital by active investigators of the problem.

The long-awaited second edition of the Handbook of Nutrition, published under the auspices of the Council, made its appearance in May, 1951, and has been very favorably received.

In connection with the subject of chemicals in foods the statement appearing in THE JOURNAL of June 23, 1951, was presented, on request, before the House Select Committee to Investigate the Use of Chemicals in Food Products of the Eighty-First Congress, Second Session.

Frozen Foods.—The increasing availability of frozen orange juice concentrate brought a great number of inquiries to the Council office concerning its vitamin C content. Because of the apparent widespread interest in this problem the Council published a report on frozen concentrated orange juice which appeared in THE JOURNAL of May 5, 1951. Included in this report was the statement, "It would appear, then, from studies made to date, that frozen concentrated orange juice, properly processed under low temperature evaporation may be an excellent and dependable source of vitamin C."

Iodized Salt.—The Council on Foods and Nutrition has supported the iodinization of table salt since 1932. The program continues to be recognized as a practical public health measure providing nutritionally essential iodine to assist in the prevention of simple goiter. At the present time fifteen different brands of iodized salt are on the accepted list of the Council. During the past year the Council has cooperated with Dr. Sebrell of the United States Public Health Service and others in the preparation of a pamphlet on the subject of iodized salt and simple goiter.

Flour and Bread Enrichment.—As early as 1939 the Council gave impetus to measures designed to improve the nutritive merit of white flour and bread by suggesting the restoration of important nutrients removed in milling. Subsequently, the enrichment program was developed as a partial remedy for losses incurred in milling. The program is now in its eleventh year and is widely regarded as an important public health measure.

Current Work.—In progress are such considerations as the following matters of interest to the profession and the public: New foods intended for use in sodium restricted diets; the use of nonfood sweeteners in commercially prepared foods; vitamin toxicity; the promiscuous use of vitamins and minerals; fluorine in foods; chemical food additives; labeling of special purpose foods; grades of milk as related to label and advertising claims; nutrition and resistance to disease; and special reports and request articles.

REPORT TO THE COMMITTEE ON LEGISLATION

Because of the Council's long term interest in the problem of food additives, the Committee on Legislation of the American Medical Association requested the Council's opinion concerning H. R. 3257, a Bill to Amend the Federal Food, Drug and Cosmetic Act, as amended, by Providing for the Regulation of Chemical Additives to Foods. This bill was carefully reviewed by the members of the Council and there was a unanimity of opinion with reference to the necessity for the establishment of an effective form of control which will prevent the use of chemical additives in foods before they have been proven to be safe. While the Council did not feel qualified to pass on the exact wording used in the bill, it did approve of H. R. 3257 in principle.

At its meeting in November, 1950, the Council passed a resolution protesting the dissolution of the Nutrition Branch of the United States Public Health Service. This was transmitted to the Surgeon General and others.

SYMPOSIUM EXHIBIT

At the request of the Association's Bureau of Exhibits the Secretary of the Council cooperated in the organization of a Symposium Exhibit entitled, "Overweight, Nutrition and Health," which was presented at the Atlantic City session June 11-15, 1951. The large attendance, together with the letters of commendation that followed, and a special citation by the Committee on Awards indicated clearly the interest of the practicing physician in the subject of foods and nutrition. The sponsoring committee consisted of Dr. Louis Dublin of New York representing the public, Dr. Elliott P. Joslin of Boston representing the group interested in diabetes, Dr. James S. McLester representing the American Medical Association, Dr. Stanley R. Truman representing the American Academy of General Practice, and Dr. Russell M. Wilder representing governmental agencies. Exhibits were prepared by the Metropolitan Life Insurance Company, the Department of Nutrition of the Harvard School of Public Health, the United States Public Health Service, the Joslin-Root Diabetic Group of Boston and the American Dietetic Association. Adjacent to these exhibits was a lecture room in which discussions were conducted throughout the day with a new speaker taking over every half hour. This pattern was followed every day of the meeting with a total of more than fifty speakers taking part in the proceedings.

ORGANIZATION

Over and beyond their professional and Association duties, Council members have made, during the past year, outstanding contributions to the solution of national and world nutrition problems. Members of the group have participated in such work in Austria, Yugoslavia, Japan, Central America, England, and our own national capitol.

The Secretary was again invited to serve as a member of the Department of Agriculture's Ad Hoc Advisory Committee on Food and Nutrition. He was also made a public trustee of the Food Law Institute.

APPRECIATION

The Council appreciates the good will that has been shown by the food industry and their advertising agencies. The decisions of the Council have been graciously accepted in almost all instances. Rapport has been excellent.

Report of Council on Industrial Health

In accordance with past experience, wars or rumors of wars impart new vitality to industrial medical progress. The year 1951 has witnessed a number of significant developments.

INDUSTRIAL HEALTH AND DEFENSE

At the time of its last annual report the Council on Industrial Health was instructed to pay particular attention to the potential contribution of the industrial health profession to defense production. In consequence, a Committee on Industrial Health Defense was created. Two problems of major significance immediately presented themselves and were assigned to subcommittees, both of which have now reported. The first subcommittee has prepared a "Disaster Blueprint for the Industrial Physician." Its recommendations included discussions of specific disaster preparation by industrial physicians with special consideration given to the scope of medical service, first aid training, organization and function of rescue squads, major equipment and supplies, first aid boxes, transportation and communication. It also recommended that, in respect to general disaster controls, industrial physicians should make a health services survey as a means of providing the community civil defense administration with an inventory of industrial health services potential and distribution.

The objectives of the second subcommittee were to inquire into the procurement of additional industrial workers, to recommend procedure for recruiting and training additional industrial health personnel involved. The report of the committee can be summarized as follows:

1. The committee has had three immediate objectives: (*a*) to inquire into the sources of additional production workers (based on available estimates) and to determine the expected demands that are to be made on the health professions in respect to them; (*b*) to recommend procedure for recruiting and training additional industrial health personnel needed to maintain such workers at peak production capacity; and (*c*) to outline the essential industrial health problems involved.

2. Manpower requirements of the present mobilization program call for a net increase in the labor force, civilian and defense, of 3.2 million workers in the two years between the last quarters of 1950 and 1952. It is expected that 2.3 million workers will be added during 1951.

3. Sources of additional manpower must come from won the handicapped, older workers and, in special circumstan adolescents.

4. The principal objectives of industrial health service are same for all workers—selective placement and health mai nance.

5. The committee estimates additional health manpo requirements, on full time bases or equivalent, for defe industry to be

	1951	1952	Tota
Physicians	640	320	960
Nurses	2,120	1,064	3,184
Industrial hygiene engineers	160	80	240

6. The committee recommends that industrial physicians voting full or a substantial part of their time to defense indus should be deferred from military service excepting those organized reserves or in priority groups 1 and 2 under Selecti Service.

7. Training of industrial physicians should include ind trination courses under sponsorship of state and county me cal societies and on-the-job training under experienced industr physicians. All medical schools should provide undergradu

instruction in industrial medicine. Postgraduate training in industrial medicine of specialty grade should be more generally available in medical, public health, or graduate schools. Industry should collaborate to supply coordinated in-plant training.

8. Small plants, especially those going into defense production, should have access to industrial health services. Steps should be taken to encourage the development of such services by individual physicians or groups, preferably under local medical society sponsorship.

Members of the Council and its staff have also participated in the preparation of health and safety standards designed to implement the Walsh-Healey Act which requires that contracts coming within its purview must be carried out under safe and healthful conditions. It is expected that these standards will represent a very important improvement in the application of preventive procedures to industry over the country as a whole.

CONFERENCES WITH STATE COMMITTEES ON INDUSTRIAL HEALTH

A conference held during the Annual Congress on Industrial Health in Atlanta in February was designed to acquaint the Council and committees on industrial health in state medical societies with the work of each and to effect improved teamwork. The goal is to accelerate the development of industrial health services in accordance with accepted standards and with emphasis on local development. The results of this conference were so satisfactory that it is intended to make this meeting an annual event.

INDUSTRIAL HEALTH AND GENERAL PRACTICE

In May 1950, the American Academy of General Practice reported that 94% of its membership cared for industrial cases, that the average number of cases seen in 1948 was 234 per member and that about 20% of its members devote full time to industrial practice. In consequence, representatives of the Academy and of the Section on General Practice of the American Medical Association were invited to meet with the Council's Professional Relations Committee to discuss a program of training for general practitioners in the fundamentals of industrial medical practice. Pursuant thereto a joint committee was established to formulate a plan of action. In summary, the recommendations of the joint committee were that a general practitioner be added to the membership of the Council, that a general practitioner be included in the members of all state or county medical society committees on industrial health, that a committee on industrial health be appointed by the Academy in each of its component groups and that the Council staff develop a detailed curriculum to be used in the postgraduate educational activities of the American Academy of General Practice, the constituent state medical associations and their component societies. The Council will be expected to prepare a list of qualified speakers and teachers for the furtherance of this training program.

NEWS LETTER

The monthly News Letter of the Council has continued to be used as a medium for exchange of information and to promote education and services. The mailing list of three hundred includes the chairman of the state committees on industrial health, state medical society executives and state health commissioners, as well as the official headquarters group. The News Letter is also published each month in the *Archives of Industrial Hygiene and Occupational Medicine*, as a means for wider distribution.

NATIONAL SAFETY COUNCIL

The staff of the Council has acted as consultants to the National Safety Council in the development of audiovisual devices used in teaching health and safety to small conference groups of employees. This is regarded as an important activity since it channels dependable information directly to the workers themselves.

ESSENTIALS OF MEDICAL NURSING SERVICES IN INDUSTRY

As previously reported, the Council, the Industrial Medical Association and the American Association of Industrial Nurses have been engaged in a joint study of medical-nursing relations in industry. The Council on Industrial Health has prepared the following statement which has been referred to the cooperating groups with strong expectations for final agreement:

Essentials of Medical Nursing Services in Industry

The status of the nurse in industry working without direct medical supervision presents an important inter-professional problem. The following statement has been prepared jointly by the American Association of Industrial Nurses, the Industrial Medical Association and the Council on Industrial Health of the American Medical Association to clarify legal and ethical principles, both for the members of interested professional organizations and for industrial employers providing any of the listed health services:

I. The value of physicians and nurses in industry depends on
  A. Training, experience and aptitude
  B. A position of authority in the industrial organization
  C. Good rapport with workers
  D. Good relations with their professional colleagues
  E. Thorough knowledge of work environment and processes
  F. Effective use of community health resources

II. A health service in industry should provide
  A. A safe and healthful work place
  B. Health counseling and health education
  C. Personal medical services as required for
    1. Observance of laws, codes and health regulations
    2. Emergency medical care
    3. Health conservation
    4. Job placement

III. Personal medical services involving the establishment of a diagnosis and the definition of treatment or the performance of specific preventive measures are functions of the physician. However, it is desirable for the nurse to participate in such services.

A. If she acts under medical supervision

B. If she acts in an emergency

Standing orders are used to supplement rather than replace medical supervision. They are defined as a written compend of directions outlining routine medical or nursing services or procedures of an emergency nature approved and signed by a licensed physician and acknowledged by him to be services and procedures which may, in his absence, and until his arrival, be performed by a particular industrial nurse. Standing orders may constitute medical supervision if they are not an attempt to delegate the exercise of medical discretion but only delegate the execution of mechanical, clerical or administrative acts.

IV. In the absence of direct medical supervision and at the time of her employment, the industrial nurse should acquaint her employer with the legal and ethical scope of her services. If she is asked to perform services exceeding her training and licensure, she should seek advice from the nearest official medical or nursing agency.

V. In respect to industrial health services other than those listed as personal, the nurse can exercise considerable initiative. Practical limits must be based on her training, experience, and the availability of qualified consultants.

FIRST AID

A Pocket First Aid Manual is in process of development as a joint project of the Council and the Bureau of Health Education. Contents will be limited to common emergencies, and instructions will be simplified so that those with no formal first-aid training will be able to understand and apply them. Introductory remarks in the Manual will point up the importance of prompt and effective action following injury whether at work, at home or at play. It should serve equally well as a useful guide in civil defense planning.

The Council also received a statement of first aid instructions issued by the Blue Cross Commission. These were reviewed by the Council and after a conference with the staffs of the Council on Pharmacy and Chemistry and Bureau of Health Ed the Blue Cross Commission was informed that these first aid recommendations were in substantial agreement with the publications of the Council.

NOISE

Attention has been directed to the growing importance of impaired hearing sustained by industrial workers exposed to excessive noise. Diagnosis and prevention were discussed at a Conference on the Problems of Noise in Industry presented at Atlantic City in April, co-sponsored by the Subcommittee on Noise in Industry of the American Academy of Ophthalmology and Otolaryngology, the Acoustical Society of America and the Council of Physical Medicine and Rehabilitation. The results of the meeting were gratifying to the medical, engineering and insurance representatives who attended. This session emphasized the need to measure environmental noise levels with special reference to various bands in the sound spectrum where greatest exaggeration has existed; to establish audiometric testing programs as a part of the medical examination in the selection and placement of workers, and to devise a better method than now exists for determination of degrees of hearing loss. All of these matters are being considered by appropriate subcommittees. One specific conclusion was that the diagnosis of occupational deafness must be dependent upon preemployment audiographic records.

THE OLDER WORKER

A Conference on Aging conducted by the Federal Security Agency in Washington last year called attention to the ability and capacity of older individuals for employment. This same problem has been discussed at a number of important conferences during the year, in all of which the Council staff has actively participated. An intensive study of the older worker in relation to employment, similar to the study of women conducted during the last war, is being actively considered.

The Council has agreed to serve as consultant to the Department of Sociology and Anthropology of Cornell University in connection with a survey which concerns itself with individuals approaching the statutory retirement age of 65, and a follow-up after retirement.

CHRONIC ILLNESS

The important relationship of chronic disease to work capacity, absenteeism and labor turnover has proved to be an important link between the Council and the Commission on Chronic Illness. In March 1951 at the first national conference of the Commission, occupational diseases were placed at the head of those in which primary preventive measures are particularly effective. Time was also devoted to secondary prevention, which includes early detection and adequate treatment of disease to stop or control its advance. A consideration of mass screening programs such as are relatively common in industrial health services led to the conclusion that much more study and practice in this field is necessary before a considered opinion could be formulated.

HUMAN RELATIONS

In accordance with instructions from the House of Delegates, the Committee on Human Relations has been formed. Some difficulty has been experienced in securing membership representing the various professions and academic disciplines desired by the Council. On Sept. 3, 1951 the Committee met with representatives of the Industrial Section of the American Psychological Association. At this meeting the discussion was centered on the subject of human factors as exemplified by motivation, morale, attitudes and emotional stability of persons as individuals as well as members of groups in relation to industrial productivity, selection and placement procedures, including follow-through on performance, and the occurrence of accidents. Consideration was given particularly to the role of "industrial physicians" in the teamwork required in industrial organizations for establishing and maintaining a high level of satisfactory human relations practices. Further there was discussion about educational methods for physicians to prepare them for interdisciplinary approaches in dealing with the problems mentioned above. Suggestions emerged from this meeting which may clear the path for fruitful results.

WORKMEN'S COMPENSATION

Further effort is being made to carry out the directive received from the House of Delegates respecting the study of medical relations to workmen's compensation administration, with assistance from the state medical associations, the International Association of Industrial Accident Boards and Commissions, the Industrial Medical Association and the American Academy of Compensation Medicine. The set of principles received from the Medical Committee of the International Association of Industrial Accident Boards and Commissions has been distributed to state medical associations as a basis for further discussions with the applicable compensation authority.

The resolution respecting free choice of physician under the regulations of the Federal Employees' Compensation Act has been referred back to the Council for additional study. A conference is being planned between the sponsors of the resolution, the Consultants on Workmen's Compensation to the Council and the Medical Director of the Bureau of Employees' Compensation of the U. S. Department of Labor.

ATMOSPHERIC POLLUTION

During the year advice has been given to the National Association of Smoke Abatement, the Air Pollution Committee of the American Association of Power Engineers, the Mid-Western Air Pollution Association and the Committee on Air Pollution of the American Society of Mechanical Engineers. Each of these technical organizations has been greatly interested in securing dependable medical consideration of important medical and health aspects. In general, the attempt has been made to discount certain alarmist trends and to base recommendations on proven evidence.

ENVIRONMENTAL HYGIENE

As authorized, the Council has established a Consultin Committee on Environmental Hygiene. An organization meetin has been held, at which time scope and function was outlined Early attention will be given to lighting and vision, stres phenomena in man, selection and placement programs and pul monary physiology with special reference to determination o desirability in industrial pulmonary disease.

REHABILITATION

The Joint Committee on Rehabilitation of the Council o Industrial Health and the Council on Physical Medicine an Rehabilitation was recently reactivated. Consideration will b given to physical restoration, vocational guidance and trainin and the proper placement of handicapped workers. Particula attention has been given to the increasing amount of legislatio regarding rehabilitation and the need for a statement of polic which would enable legislative committees in the America Medical Association and in the state societies to analyze ther intelligently.

EDUCATION

At the request of the Board of Directors of the America Academy of Occupational Medicine, an educational progra has been approved which will be directed towards medica schools and local medical societies. It has been felt that th Academy could provide speakers in various parts of the countr and that the Council could provide publicity and make arrange ments for a series of lectures. During the year steps were take to create an American Board of Occupational Medicine. Th interim group contained representation from the Industrial Medical Association, the American Academy of Occupational Medicine, and the Section on Preventive and Industrial Medicine and Public Health of the American Medical Association. A constitution and by-laws were approved calling for nominations to a Permanent Board, rotation of these same groups which in turn would define the character of training and experience needed to qualify for membership. The Council has no direct responsibility in the development of a certifying board although a number of its members have served in the organizational activity described.

Report of Council on National Emergency Medical Service

This report of the Council on National Emergency Medical Service covers the period from Oct. 1, 1950 to Sept. 30, 1951. During this period, the activities of the Council have been increased and expanded to keep pace with the chaotic international situation. The continuance of the conflict in Korea and the increasing possibility of an all out war have served to underscore the need for accelerating civil defense planning and for developing and implementing sound policies and procedures for mobilizing the nation's medical manpower.

MILITARY AND SELECTIVE SERVICE ACTIVITIES

The employment of a large number of military and naval personnel in Korea and for occupation purposes in Europe and Japan has occasioned a reversion to the utilization of medical personnel on a wartime basis. The Council has, therefore, worked closely with the Surgeons General of the Armed Forces and the Armed Forces Medical Policy Council of the Department of Defense in an effort to (*a*) prevent a repetition of the medical overstaffing which occurred in certain areas during World War II; (*b*) curtail the utilization of medical personnel on nonprofessional assignments; (*c*) facilitate and increase the efficiency of the administration of the Doctor Draft Law (Public Law 779, 81st Congress, as amended), and (*d*) effect a timely and orderly system of recall and rotation of medical reservists.

Reports received from individual physicians and from official spokesmen for the Armed Forces indicate that there has been a marked improvement in the recruitment and the utilization of medical personnel. It is also readily apparent, from official medical reports from the Korean theater, that the quality of medical care being furnished is far superior to that furnished during any other period of our nation's history.

The Council has attempted to insure a proper balance between the medical needs of the civilian population and the serious and pressing demands for physicians by the Armed Forces by working closely with the Health Resources Advisory Committee and the National Advisory Committee to Selective Service System on a national level and with the State Advisory Committees to Selective Service on a local level. In addition to participating in general planning and policy formulation of this type, the Council has brought numerous deserving individual cases to the attention of local advisory committees and has thereby insured their proper and equitable disposition.

A continuing effort on behalf of the Council has contributed, in a large measure, to the adoption of the following two policies by the federal government:

1. The transfer of seriously disabled service personnel to Veterans Administration hospitals and domiciliary centers. This policy has resulted in a more efficient use of such veterans facilities and the reduction of the need for additional military medical installations.

2. The utilization of civilian physicians, with reserve commissions, in the performance of induction and periodic reserve physical examinations. This procedure reduces the number of physicians required in the Armed Forces and permits the individual physician to earn point credits under the provisions of Public Law 810, 80th Congress.

An analysis has been made of existing provisions of law granting medical benefits to dependents of service personnel and of proposals to extend such benefits. It is the belief of the Council that wholesale extensions of such benefits to the dependents of military personnel without regard to need or the availability of private medical facilities and to the civilian employees of the Government, as have been proposed, would in actuality be a step toward the socialization of medical care.

On Aug. 17, 1951 the Chairman and other members of the Council appeared before the National Security Training Commission and made extensive recommendations with respect to the following health and medical aspects of Universal Military Training:

(*a*) The continuation of preprofessional and professional education for qualified students.

(*b*) The method of performing preinduction, induction, and periodic reserve physical examinations.

(*c*) Extent of medical services to be provided for members of the national security training corps.

(*d*) Eligibility of members of national security training corps and reserve components for veterans medical benefits.

(*e*) Source and selection of medical and allied professional personnel to man the program.

The proposals of the Council were well received by the Commission, which will recommend the framework of a Universal Military Training Program to the Congress in the near future, in accordance with Public Law 51, 82nd Congress.

CIVIL DEFENSE ACTIVITIES

As a result of the acceptance of the theory of total war by certain countries, the tremendous increase in the areas of wartime operations and the introduction of new weapons of mass destruction, it is imperative that the medical profession continue and accelerate its integration into national and local civil defense medical planning. An appreciation of the seriousness of the present international situation and an understanding of the management and manner of caring for the casualties which would result from an atomic, biologic or chemical attack are two of the most important challenges facing American medicine.

In an effort to sponsor an educational program with respect to the medical aspects of civil defense, the Council has continued to maintain close and constant liaison with the Federal Civil Defense Administration. The information received from this and other sources has been disseminated to the membership of state medical societies through the state emergency medical service committees. An effort has been made to obtain all civil defense medical literature and local civil defense plans, which in turn have been distributed for the information and guidance of the state emergency medical service committees.

Beginning with the first week of May, a weekly Information Memorandum has been distributed to the members and consultants of the Council, advising them of the latest civil defense developments and furnishing them with copies of the most recent civil defense publications. A similar News Letter is dispatched on a monthly basis to a mailing list of over five hundred persons, mainly the chairmen and members of state emergency medical service committees.

The Council is now in the process of preparing a bibliography of published material and in the establishment of a package library service in order to facilitate the furnishing of this literature to any interested physician.

During the month of January, 1951 questionnaires were sent to each state and territorial medical association for the purpose of determining the status of local civil defense medical planning and to obtain suggestions as to how the Council could be of greater assistance. Replies were received from all but six societies. Since the receipt of this information, frequent contacts had been made with the state emergency medical service committees to assist them in accelerating and perfecting their local planning. It is planned to canvass the state societies again within the next month to obtain a more up-to-date status report.

Three publications dealing with planning and organizing for radiological defense were prepared by Dr. George M. Lyon and published under the sponsorship of the Council. These publications, which received excellent reviews, have been requested by over 650 individuals and organizations. They are entitled:

Planning and Organizing for Radiological Defense in Civil Defense.

Training Plan, Courses in "Medical Aspects of Atomic Warfare," "Medical Aspects of Radiological Defense," "Radiological Defense (Monitors)."

Civil Defense Planning and Organization with Special Reference to Medical and Health Services, including Radiological Defense.

A series of ten technical articles dealing with the medical aspects of civil defense are currently being published in THE JOURNAL of the American Medical Association under the sponsorship of the Council. All of the articles have been submitted to THE JOURNAL and seven have been published to date. When the publication of the entire series is completed, it is planned to reproduce and distribute them in a booklet form. The articles are entitled:

Civil Defense Organization and Medical and Health Service in Civil Defense, by Dr. James C. Sargent.

Medical Aspects of Civil Defense in Biologic Warfare, by Dr. Victor H. Haas.

Local Tactical Planning and Logistics in Medical Aspects of Civil Defense, by Dr. Perrin H. Long.

California reversed an appellate court decision referred to in the last annual report of the Bureau and held that the property of a charitable hospital used for a thrift shop is not exempt from taxation even though the income therefrom is wholly used for charitable purposes.[17] The Supreme Court of the United States held that the Federal Government is not liable, under the Federal Tort Claims Act, for injuries to servicemen attributed to alleged negligent treatment given by army surgeons.[18] It is discriminatory to make a lay laboratory pay a sales tax for x-ray film used by it and to exempt from such tax hospitals and x-ray laboratories not under lay control, according to the district court of appeals, 2nd district, division 1, California.[19] The Supreme Court of the United States upheld the validity of the Marihuana Tax Act as a legitimate exercise of the taxing power, despite the act's collateral regulatory purpose and effect.[20] The Supreme Court of Mississippi held that the existence of outstanding capital stock did not necessarily disqualify a hospital as a "non-profit corporation." [21] A mechanotherapist, according to the Supreme Court of Ohio must not prescribe or administer drugs of any kind in performing minor surgery. The minor surgery which is performed must be an operation within the limits of mechanotherapy, and vitamins, liver extract, sulfathiazole ointment and metycaine are drugs within the meaning of the Ohio law.[22] The Court of Appeals of Maryland held that, under the facts shown, a chiropractor could maintain an office in the basement of his home, even though the deed to the property on which the home was erected contained a restriction that it "shall be occupied and used for residence purposes only and not otherwise." [23] The United States district court, district of Oregon, held that the Oregon State Medical Society, the Oregon Physicians Service and a number of individual physician defendants did not, in the organization and operation of Oregon Physicians Service, conspire to restrain and monopolize prepaid medical care in the state or the prepaid medical business in the areas in which it operated. The court also held that the practice of medicine as conducted by the doctors in the state and the sale of medical services as conducted by doctor-sponsored organizations within the state, are not trade or commerce within the commerce clause of the Constitution or within the Sherman Anti-Trust Act.[24] In Texas, the State Medical Association joined with two county societies in a statement that certain advertisements of the Committee for Chiropractic Education, Inc., were paid 'special edition' packed with misrepresentations. However, it was written to look like a real news section so that its misrepresentations might appear to be legitimate." The court of appeals held in effect that such a statement was libelous per se.[25]

Two decisions involved the right of the governing board of a governmental hospital to dismiss physicians from staff membership. The Supreme Court of Wisconsin held of no effect a resolution adopted by a municipal hospital permitting the board to dismiss a physician from the staff when, in its sole judgment, the good of the hospital or of the patients demanded it. The decision was grounded on the failure of the resolution to provide for (1) notice to the physician of the nature of the charges against him or (2) notice to the physician of the date of a hearing at which he could appear and defend himself.[26] The Supreme Court of Arizona held a resolution of a county hospital void for the same reasons. It also held to be so unreasonable as to be unconstitutional a resolution of the hospital which provided that if any doctor using the hospital facilities requests another doctor, also using such facilities, to assist him professionally, and that doctor refuses to give such assistance, then the physician so refusing would not be allowed to use the hospital facilities thereafter.[27] In another Arizona case, the Supreme Court held that naturopaths may not use drugs in the practice of their branch of the healing art.[28] The same court also expressly overruled one of its prior decisions and held that charitable institutions (in this case a hospital) are liable for the torts of their servants from which injury results to a third person, whether or not such third person is a patient and whether or not such patient is a paying or a non-paying one.[29] The United States district court in Iowa held that the earnings of a nonprofit organization did inure to the benefit of indivdual members when such members were reimbursed for expenses of litigation and for judgments rendered against them. The organization was held not to be exempt from the payment of a capital stock tax.[30]

STATE LEGISLATION IN GENERAL

The annual summary of state laws of interest to medicine prepared by the Bureau will be published in THE JOURNAL in the near future. Reference is here made to some of the more important 1951 enactments.

Basic Science Acts.—A new basic science law was enacted in Nevada, bringing the total to nineteen states, the District of Columbia and Alaska. An amendment to the Arizona basic science act exempts physicians employed full time by federal and state hospitals and by federal, state or local health departments. A Wisconsin amendment exempts dental hygienists. A Texas amendment permits the issuance of temporary license effective until the next regular meeting of the board of basic science examiners.

Laws Relating to Limited Practitioners.—A state board o chiropractic examiners was created in Pennsylvania. By this la chiropractic is defined as a system of locating misaligned o displaced vertebrae of the human spine, the examination pr paratory to and the adjustments by hand of such misaligned o displaced vertebrae and other articulations together with th use of scientific instruments of analysis as taught in approv schools and colleges of chiropractic without the use of eith drugs or surgery. The term "chiropractic" does not include th practice of obstetrics or reduction of fractures or major disloc tions. An amendment to the Nevada chiropractic act provid for the licensing of persons desiring to practice chiroprac physical therapy which is defined to be the adjustment of th articulations of the human body by hand and the use of elect cal, mechanical, hygienic and sanitary measures, which measur do not pierce or sever the body tissues. A Florida law provid that no person shall operate a chiropractic hospital without fi obtaining a license to do so from the Florida state board chirpractic examiners.

Two Pennsylvania laws relate to the practice of osteopath One defines the word "physician" as an individual licensed und the laws of the state to engage in the practice of medicine an surgery or in the practice of osteopathy or osteopathic surge The other defines the word "medical examiner" in connecti with private and parochial school examinations as includi licensed physicians qualified to practice medicine and surge or osteopathy or osteopathic surgery.

Although two other states were asked to do so, only Oreg enacted a law providing for the creation of a state board examiners in massage. This law defines massage as pressure o friction against, stroking and kneading the body and gymnasti with or without such appliances as vibrators, infra-red heat, s lamps and baths in order to maintain good health and to esta lish and maintain the body in good physical condition, provid that no person licensed under this act may give chiroprac adjustment, osteopathic manipulations or naturopathic manip lations.

Florida, Georgia, Illinois, Minnesota, New Hampshire, Ne Mexico and North Carolina enacted either registration or licen ing laws to regulate the practice of physical therapy. In ge eral, these laws define physical therapy as the treatment o disability, injury and disease by nonmedical means comprisin the use of massage, therapeutic exercises and the physical, chem cal and other properties of heat, light, water and electrici (except roentgen rays, radium and electrosurgery). All of thes laws provide, in effect, that registrants thereunder shall practic as physical therapists only under the prescription, direction an supervision of a licensed physician. A Connecticut law authoriz the Board of Trustees of the University of Connecticut to off instruction in physical therapy as a part of the university program and to grant suitable degrees therein.

---

[17] *Cedars of Lebanon Hospital v. Los Angeles County,* 221 P. (2d) 31.

[18] *Jefferson v. United States, United States v. Griggs,* 71 S. Ct., 153.

[19] *Marainville v. State Board of Equalization,* 222 P. (2d) 898.

[20] *United States v. Sanchez,* 71 S. Ct., 108.

[21] *Craig v. Mercy Hospital-Street Memorial,* 47 S. (2d) 867.

[22] *Botkin v. State Medical Board,* 96 N.E. (2d) 215.

[24] *United States v. Oregon State Medical Society,* 95 F. Supp., 103.

[25] *State Medical Association of Texas v. Committee for Chiropractic Education, Inc.,* 236 S.W. (2d) 632.

[26] *Johnson v. City of Ripon,* 47 N.W. (2d) 328.

[27] *Findlay v. Board of Supervisors,* 230 P. (2d) 526.

[28] *Kuts-Cheraux v. Wilson,* 229 P. (2d) 713.

[29] *Ray v. Tucson Medical Center,* 230 P. (2d) 220.

[30] *National Chiropractic Association v. Birmingham,* 96 Fed. Supp. 874.

Georgia and Minnesota enacted laws creating a state board of examiners of psychologists. The Minnesota law did not define psychology or psychologists, but the Georgia law defines a psychologist as a person who holds himself out to be an applied psychologist and renders to individuals or to the public for fees any service involving the application of recognized principles, methods and procedures of the science and profession of psychology, such as interviewing, administering and interpreting tests of mental abilities, aptitudes, interests and personality characteristics for such purposes as psychological diagnosis, classification or evaluation or educational or vocational placement or for such purposes as psychological counseling, guidance or readjustment. Nothing in the Georgia law permits the administration or prescription of drugs or the practice of medicine. A New York law amends the existing mental hygiene law in relation to certified examiners and certified psychhologists, by providing that such person must have had two years of post-graduate study in psychology including advanced courses in clinical and abnormal psychology and testing at an approved university or college and three years of full-time or equivalent part-time clinical experience in the psychological examination of children or mental defectives.

Medical Practice Acts.—The only state which enacted a complete revision of its medical practice act was Colorado. Some of the significant changes contained in this revision are: (1) two members of the board of medical examiners must hold the degree of doctor of osteopathy; (2) the new definition of practice of medicine specifically covers the treatment of mental conditions; (3) the definition of medical college includes colleges conforming to the minimum educational standards established by the American Osteopathic Association; (4) the definition of an approved internship includes internship in hospitals conforming to the minimum standard for intern training established by the American Osteopathic Association; (5) the definition of approved residency includes residency in hospitals conforming to the minimum standards for residency training established by the American Osteopathic Association; (6) interns and residents rendering services in hospitals in the state are specifically exempted from the medical practice act under prescribed conditions; and (7) pharmacology, chemistry, bacteriology, gynecology, therapeutics, public health and sanitation are added to the list of examination subjects.

A number of miscellaneous medical practice act amendments were enacted. In Florida, Oklahoma and Virginia annual registration laws were enacted. A California amendment defines the word "diagnose" or "diagnosis" to include any undertaking by any method, device or procedure whatsoever, whether gratuitous or not, to ascertain or establish whether or not a person is suffering from any physical, mental or nervous disorder. The taking of a person's blood pressure is specifically included. Oklahoma and Wisconsin enacted laws permitting the use of the injunctive process to restrain violations of the medical practice acts. Delaware, Illinois, Nevada, New Hampshire and Texas enacted laws authorizing the issuance of temporary certificates to practice medicine under prescribed circumstances. Alabama and Maine authorized their boards of medical examiners to issue reciprocity certificates in certain instances and a California amendment provides that the applicant for a reciprocity license must have had a license issued in some other state at least one year prior to the date of application for a California license.

In relation to internship, a new California law provides that applicants who graduated from a foreign medical school may, in lieu of a one year internship in a hospital approved by the board, complete a final year of medical instruction in an approved medical school in the United States, and Oregon eliminated the one year internship requirement as a condition of licensure. In Florida, California and Illinois the adjudication of insanity of a practitioner was made grounds for the revocation of the practitioner's license. A California law provides that any physician who while in actual attendance on patients is intoxicated to such an extent as to impair his ability to practice shall be guilty of a misdemeanor. Another California law provides that after 1955, applicants for a physician's and surgeon's certificate must present evidence of having completed a three year residence course of college grade before commencing the study of medicine. A Florida amendment requires applicants for a license to be citizens of the United States. Another Flordia law authorizes the board of medical examiners to pass upon the good standing and reputability of any hospital and to determine those which maintain a standard of training sufficient to be recognized by the board. A third Florida law provides that no person may be employed or act for more than three years, as a resident physician, assistant resident physician or intern without registering with the state board of health. To continue such employment beyond three years, the person must become duly licensed as a physician by the board of medical examiners. A New Mexico amendment provides that nothing in the medical practice act should be construed to prohibit any physician who has been lawfully licensed to practice in another state from entering into a contract with a New Mexico state institution to serve as a member of the medical staff exclusively, or from entering into a contract with an employer for the treatment of its employees only if such employer maintains a hospital for the benefit of its employees and if the physician submits proof that he has received a notification by the medical examining board of New Mexico that he possesses the necessary character and qualifications. A West Virginia amendment would admit to examination for a medical license persons graduating from a medical school after January 1, 1939, if they meet all the requirements of the law pertaining to education and training except that their medical school was not at the time of graduation a class A medical school as defined by statute. A Wisconsin law authorizes the board of medical examiners to accept, in lieu of its own examination, the certificate of the National Board of Medical Examiners.

Corporate Practice of Medicine.—A California law authorizes the board of medical examiners to grant approval of the employment of physicians and surgeons on a salary basis by licensed charitable institutions, foundations or clinics or by approved medical schools operating clinics therewith, providing no charge for professional services rendered to patients is made by the institution. A Connecticut law authorizes the incorporation of medical clinics. This law provides that any three or more persons licensed pursuant to the medical practice act may associate to form a corporation, without capital stock, to own, operate and maintain a clinic for the study, diagnosis and treatment of human ailments and injuries by persons duly licensed and to promote medical, surgical and scientific research and learning provided that such corporation may not itself give medical or surgical treatment, consultation or advice and provided that persons duly licensed, and no others, may be members of such corporation. Before commencing operations, such corporations must receive a certificate of registration from the Connecticut medical examining board, which certificates shall be renewed annually.

Barbiturates and Other Drugs.—Laws prohibiting the sale of certain drugs except on the written prescription of a physician were enacted in Arkansas, New Mexico and Texas. The Arkansas law amends the 1935 law which applied only to the barbiturates by adding amphetamine and desoxynor-ephedrine. The New Mexico law makes it unlawful for any person to sell any dangerous drug except on the prescription of a licensed physician, dentist or veterinarian, with exceptions relating to wholesalers, and defines the term dangerous drugs as including hypnotic drugs (acetylurea derivatives, barbituric acid derivatives, chloral, paraldehyde, phenylhydantoin derivatives, sulfonmethane derivatives) aminopyrine, cinchophen, diethylstilbesterol, ergot, cotton root, sulfanilamide, thyroid, and compounds of any of these drugs. The Texas law makes it unlawful to sell or deliver any barbituric acid, amphetamine and desoxyephedrine except by a pharmacist upon an original prescription of a physician, dentist, chiropodist or veterinarian.

Hospital Licensing Laws.—Michigan, Nevada, New York and Washington enacted either amendments or new laws relating to the licensing of maternity hospitals. A new Washington law provides regulations for the licensing and regulation of nursing homes and a Wisconsin revision of the law relating to the licensing of nursing homes provides for the use of the injunctive process against any person or agency operating such a home without the required license. A California law authorizes the

State Deparment of Public Health to prescribe minimum standards for public medical institutions and to certify to the State Department of Social Welfare those institutions which meet the standards established.

Anatomic Acts; Testamentary Disposition of Body.—Laws providing for the distribution to certain research and educational institutions of unclaimed dead human bodies, under certain prescribed circumstances, were enacted in Arizona, Florida, Kansas and Wisconsin. A North Carolina law authorizes a person by will to dispose of a whole or a part of his or her body to a teaching institution, university, State Department of Health, legally licensed hospital or any other agency or commission authorized to operate an eye bank, bone or cartilage bank, a blood bank or any other bank of a similar nature and kind designated for the rehabilitation of the maimed.

Animal Experimentation.—Laws relating to animal experimentation were enacted in California, Illinois, Oklahoma and South Dakota. In general, these laws authorize a particular department of the state government to issue licenses to certain qualified institutions desiring to obtain and use animals in the conduct of scientific and educational activities.

Blood Grouping Tests.—A Pennsylvania law provides that in any proceeding to establish paternity the court on motion of defendant shall order the mother, her child and the defendant to submit to one or more blood grouping tests by a duly qualified physician to determine whether or not the defendant can be excluded as being the father of the child, and the results of such tests may be received in evidence in cases where definite exclusion of the defendant is established.

Prepayment Medical and Hospital Care Programs.—An Illinois law provides for the incorporation of lay sponsored voluntary health services plans which need not obtain the cooperation of a majority of the resident doctors in any county in which it proposes to operate. A Connecticut law would permit nonprofit medical service corporations to make payment for the professional services of dentists. A Kansas law amending the nonprofit medical service corporation acts, set up provisions relating to the establishment of reciprocity benefits which may be applicable to employees of corporations transacting business in Kansas. A West Virginia law provides, among other things, that spital and medical nonprofit corporations must provide, in eir contracts, that in case of a deficit of available funds, each participating hospital or physician will accept a prorata share of available funds in full settlement of any bill submitted. An Illinois law provides new regulations for the organization of nonprofit hospital service corporations.

Medical Examiners; Autopsies.—An Arkansas law establishes the office of state medical examiner and prescribes the powers and duties of such medical examiner with respect to investigations and autopsies. The law provides that the state medical examiner shall be the head of the department of pathology of the University of Arkansas Medical School and that there shall be established a laboratory having adequate facilities for the conduct of autopsies and of such pathological, bacteriological, toxicological examinations as may be necessary or proper. Two Florida laws concern the appointment of county medical examiners and the duties of such medical examiners relating to autopsies and investigations of death. Another Florida law authorizes certain county judges and county solicitors throughout the state to secure the services of a physician in connection with the investigation of crime. A New Jersey law authorizes county physicians to perform autopsies or to direct some licensed physician to do so when in the opinion of the county physician an autopsy is necessary to determine the cause of death. A South Dakota law sanctions the performance of an autopsy by a physician or surgeon when authorized (*a*) by the deceased during his lifetime, (*b*) by the deceased's surviving spouse or (*c*) if the surviving spouse is incompetent or not available or if there be no surviving spouse, by an adult child, parent, brother or sister of the deceased. An Alabama law directs the state toxicologist to furnish a certified copy of any investigation which he conducts, to the person who orders the investigation, and provides further that original copies of such reports shall be retained by the state toxicologist and shall be open to public inspection at all reasonable times.

REBATES

In July, 1946, the United States filed complaints against certain optical companies and more than 4,000 individual physicians charging the defendants with a violation of the Sherman Anti-Trust Act for engaging in rebating practices in connection with the dispensing and sale of eye glasses. In May, 1951, almost five years later, final judgments were approved and entered in these cases. These final judgments enjoined the individual and corporate defendants from accepting or paying, directly or indirectly, any such rebates in the future. Existing laws in a number of states also specifically prohibit the paying or accepting of rebates. During the past year the Bureau brought its comparative chart of these state laws up to date. Copies of this chart are available on request.

COOPERATION

This report would be incomplete if it did not give grateful acknowledgment of the helpful cooperation extended to the Bureau during the year, particularly by the Board of Trustees, the Secretary's Office, and members of the official staffs of bureaus and councils at headquarters. The Bureau hopes that it has, in its effort to reciprocate, met with success.

Report of the Bureau of Health Education

There have been no radical changes during the past year in the program of the Bureau of Health Education. The principal phases of activity continue to be the answering of questions by mail, preparation and distribution of radio transcriptions, preparation and broadcasting of network documentary programs, exploratory activities of the television field, the school health program, pamphlet publications, cooperative and liaison activities with other agencies, studies in school health procedures and studies in the teaching of preventive medicine in medical schools.

Today's Health and the Bureau continue to work in close cooperation, each supplementing the work of the other until they have become practically one unit.

QUESTIONS AND ANSWERS

Individual communications received and answered in th Bureau Department responsible for dissemination of health edu cation information for lay consumption totaled 12,722 for th period from Sept. 1, 1950, through Aug. 30, 1951. Each wa given individual screening, and in addition to personal replie special referrals were made to one or more of 26 national organ zations concentrating on specific problems such as heart disease diabetes, cancer, epilepsy, tuberculosis, etc.

With a slight increase in virtually all categories in which princ pal interest was displayed, there was some shift in popularity o individual topics. Mental hygiene took the lead followed by plas tic surgery, allergy and child guidance. Interest in plastic surgery doubtless can be credited to newspaper accounts of methods fo correcting scars and other skin blemishes. The only other ne topic in the list was child guidance. Although inquiries about th American Medical Association and its services increased onl slightly, continuing interest is evident.

In addition to literature sent on specific request, a variety c free material was mailed, principally to school teachers, in whic chief emphasis was on general services of the Bureau and th interest of the American Medical Association in health educatio and community health services. Answers were provided for questions referred from various health museums and health exhibit presented under medical society or auxiliary auspices.

From the correspondence handled, questions and answers considered of sufficient general interest were selected for publication in *Today's Health.*

LOAN COLLECTIONS

Requests for material intended to assist physicians in the preparation of talks for lay groups came from 24 states and included 21 different topics. The subjects most in demand were medical advances, sex education, heart disease and cancer.

Encouraging evidence continues to be observed that more and more state medical societies are providing material of this nature for use by physician members as part of the greatly increased interest in promotion of sound health education and favorable attitudes on the part of lay groups.

NEW ELECTRICAL TRANSCRIPTIONS

The following new radio transcription series have been prepared:

(*a*) *The Best Is Yet to Be.*—A 13-program dramatization series dealing with some of the problems of older people with emphasis on how they can live more successfully and more happily.

(*b*) *Hi-Forum.*—A unique series of documentary interviews tape recorded on the spot in fourteen American cities of all sizes and kinds in all parts of the nation. The teen age high school students, in discussion of their own most vital problems of physical and emotional health, are representative young Americans coming from large cities and farm communities, many races and religious, in a variety of social and economic backgrounds. Programs were planned in cooperation with high school faculty and youth leaders and high school and college radio workshops.

(*c*) *Main Street Medicine.*—A series of dramatizations giving the highlights typical of the progress which the "main street" communities in the United States are making by cooperative effort of many citizen groups toward providing better medical care and public health services at prices which bring these necessities within the reach of everyone.

(*d*) *Gold Medal Doctors.*—Each year since 1938 the American Medical Association has awarded a Gold Distinguished Service Medal to a physician for scientific achievement in the course of his life. These transcriptions are authorized biographies of the recipients of the award including recorded remarks in their own voices, where available.

Productions to be released during the remainder of 1951 consist of the following series: "Doctors Report" and "Panorama of Research."

"Doctors Report," released on Sept. 15, 1951, consists of 13 transcriptions recorded from the 100th annual session of the American Medical Association, which contain the latest advances in medical progress. The programs were selected from 24 recorded for the Voice of America and now being broadcast to English-speaking physicians in Europe, the Far East and Southwestern Asia.

Preparations have also proceeded for the release of "Panorama of Research," a narrated series by Cy Harrice with script by Farlan Myers.

A feature in preparation for 1952 is "Interlude." This series is a sequel to the successful transcription series, "Melody of Life" and presents the life stories of 13 composers with reference to their health and aging problems.

DOCUMENTARY RADIO PROGRAMS

The Bureau produced three documentary programs in the past year.

1. *Machines Without Men.*—A documentary radio poem on progress and industrial health starring Carl Sandburg, prepared under the supervision of the Director of the Bureau, together with Dr. A. J. Lanza, Chairman, and members of the staff of the Council on Industrial Health. This program was broadcast over the NBC network Sept. 7, 1950.

2. *The Wooden Fish.*—A special 30 minute dramatized program emanating from the World Medical Association Meeting last autumn. This program was released Oct. 19, 1950 and recordings of it were sent to all radio stations using the Bureau's electrical transcriptions. The World Medical Association meeting in New York last year was called to order by a gavel in the form of a fish. This symbol was presented to the association, which represent 500,000 physicians across the world, by the delegate from Nationalist China. It represents to Orientals the symbol of intelligence and energy, and it is also the symbol of ancient Christianity. The timeliness of this subject and its message in support of democracy and against communism created the incentive for this program. Reports indicate that this program was well received.

3. *School House Anywhere.*—The second documentary network program produced in 1951 utilized an unusual radio technic, featuring students of the New Trier Township High School, Cook County, Ill., Verse Choir as "Narrator." This program depicts problems and hazards concerning school children today. Mail requests for scripts and the excellent appraisal of this program by the general public and health educators throughout the country indicate that "Schoolhouse Anywhere" was well received.

RADIO PLATTER SERVICE

The electrical transcriptions distributed by the Bureau of Health Education have gone to varying numbers of stations annually. Usually between 300 and 400 stations carry the programs each year. There is adequate evidence that the electrical transcriptions perform a highly valuable continuing service from which the medical profession is reaping the good will of the radio stations and through which large audiences are being served, often in out of the way places not reached through other channels by the medical profession. In many instances newly established radio stations request our programs to be a part of their specially advertised opening broadcasts. Large numbers of commercial stations regularly place the programs on sustaining time in major population centers and often at the most favorable listening hours. In a few instances local commercial sponsors have been procured and these have been as continuously pleased with the platters as have the program directors of the stations.

In many cases the platters have been requested by and furnished to schools for use in the classroom, and several times cooperation has been established between broadcasting stations and school systems for in-school listening integrated with the health teaching curriculum. To the present knowledge of the Bureau, the platters are performing a useful service in health education and are keeping the name of the American Medical Association before the people in a constructive and favorable light.

In addition to distribution within the United States, the platters have been used in Alaska, Hawaii, the Philippines and the Canadian provinces of Ontario, Quebec and Alberta. Samples and scripts have gone all over the world in reply to requests received in response to announcements in radio trade publications and the educational press, as well as in publications of the United States Government. The National Association of Broadcasters has the platters on its list of recommended transcriptions as does the Federal Radio Education Commission of the U. S. Office of Education.

TELEVISION

The Bureau of Health Education produced one television show during the fiscal year. The program was entitled "Dr. Webb of Horseshoe Bend" and was telecast over WABC, television, New York, on Jan. 22, 1951 from 8:30 to 9:00 p. m. This half hour dramatic show, starring Walter Hampden, emphasized the importance of the general practitioner, and the problem of doctor supply in rural areas. Kinescopes (16mm sound tract films) were made available to local medical societies without charge, except return postage, for single showings in each television community. Considering that distribution of the "Dr. Webb" kinescope was utilized in more than two-thirds of the television outlets throughout the United States, the outcome of the Bureau's first venture in television production can certainly be termed satisfactory.

Early in 1951 the Bureau also released a series of twelve television scripts planned for local production. Each script package contains sufficient copies for studio use in production, as well as all necessary casting and prop lists. All illustrative material—including titles on slide film, drawings and photographs, charts, and so forth are likewise included in the script package. These materials are on loan at no charge to local medical societies and must be returned after use.

RADIO AND TELEVISION FROM CLINICAL AND ANNUAL SESSIONS

Radio and television service other than scientific telecasting in color in connection with the Cleveland Clinical Session and the Atlantic City Annual Session were handled, as usual, by the Bureau of Health Education.

In many instances the Bureau's materials were used by well-known broadcasters and telecasters, such as Arthur Godfrey, Edward R. Murrow, Pauline Frederick and Nancy Craig, on established programs with wide and regular listening audiences.

SCIENTIFIC BROADCASTS ON "VOICE OF AMERICA"

During the 1951 Annual Session of the American Medical Association, the Bureau of Health Education at the request of the United States Department of State made 24 tape recordings based on scientific exhibits or papers shown or read at the session. These are for broadcast to English-speaking areas overseas. Thirteen of the 24 tape recordings will be made into a special series of electrical transcriptions available in the United States to county medical societies about Sept. 15, 1951 on the usual basis of distribution of the electrical transcriptions prepared by the Bureau. This series will be entitled "The Doctor's Report."

SPECIAL BROADCASTS

The Bureau handled radio coverage for the Annual Congress on Medical Education and Licensure, held in Chicago in February, 1951. Ten visiting medical leaders and three members of the American Medical Association headquarters staff participated in four roundtable discussions, two radio interviews, a television show and two newscasts.

LOCAL RADIO BROADCASTS

Eighteen local broadcasts were given by the staff of the Bureau in connection with meetings they were attending in other cities and in Chicago.

HEALTH AND FITNESS DIVISION

The Health and Fitness Division now functions as an integral part of the Bureau of Health Education. Services to state and local medical societies and to educational, public health, voluntary and governmental agencies continue to be centered in the various fields of school health—school health services, school health education and healthful school living. The consultive team, consisting of a physician and educator, has aided materially in making the Association's services in this area acceptable to all of the professional interests involved.

During the past year the two consultants accepted invitations from 20 states and the District of Columbia to deliver addresses, take part in conferences or institutes, attend annual meetings of health, educational or other organizations and perform a variety of other services. In addition, Dr. Dukelow made several trips to Washington, D. C. to continue work begun earlier in 1950 on the Fact Finding Report for the Midcentury White House Conference on Children and Youth. He was also active in planning and conducting meetings at the Conference besides arranging for a preconference orientation session for physicians and medical ociety representatives who were delegates to the White House nference. Dr. Hein worked closely during the year with a i Conference of representatives of the National Council of i f State School Officers and the Association of State and erritorial Health Officers in the development of a statement on responsibilities in school health services and served on the editing committee of the group.

The Third National Conference on Physicians and Schools is to be held at Highland Park, Ill., Nov. 6 to 8, *1951*, in response to numerous requests for the repetition of this Conference at two-year intervals. The Conference will be attended by representatives of interested national agencies and organizations as well as delegates from state and territorial medical associations, and health and education departments. The discussions will center on the relationship of the family physician and the school physician to school health services in health appraisal, follow-up of health needs of school age children, physical education including athletics, emergency care of injury and sudden illness and communicable disease control, and the implementation of these services at the state and local level. Several state and local conferences are scheduled to be held on the same subject, partly because of the encouragement this office has given to state and local groups to carry on the same thinking at home, and partly because of their interest in the reports of the National Conferences.

A nation-wide survey of school health services by means of a questionnaire to the secretary of each local medical society was completed early in the year. The consultants jointly reported the results of the survey at the 1950 annual meeting of the American Public Health Association. Copies of the complete report are available from the Bureau.

An additional study on the nature of medical school teaching of school health subjects and physician attitudes toward school health services is now under way. The survey is being conducted by means of interviews with professors of preventive medicine or other appropriate faculty members at medical schools. To date interviews have been completed at eight institutions. Because of the nature of the study and the relative slowness of the interview procedure the investigation is regarded as a long-term project which will no doubt require a number of years to complete.

The Consultants have continued to provide assistance to th Joint Committee on Health Problems in Education of the N tional Education Association and the American Medical Ass ciation, as technical assistants to the several subcommittees. Th Educational Consultant, Dr. Hein, is a member of the Joi *Committee and its Secretary.*

The Medical Consultant, Dr. Dukelow, has served in a co sultive capacity to the Council on Medical Service's Committ on Maternal and Child Care. This arrangement has made po sible close liaison between the activities of the Council in th field and those of the Bureau of Health Education in relati to school health programs.

Health education films, particularly those used for visual ed cation in the schools, are an important educational medium. T Consultants review all such films coming to the Committ on Medical Motion Pictures to determine their technical a curacy and applicability. In addition they have aided vario producers in the preparation of films and film strips for scho use on health education subjects.

An important part of the consultation services are given the conferences and institutes conducted by universities, teache colleges, state departments of health and education and oth agencies to improve the understanding of school health servic and school health education.

The Educational Consultant was appointed by the Board Trustees to represent the Association at the National Conferen on Physical Education for Elementary School Children held January of the past year where he served as Chairman of t Editing Committee. The Conference report presenting the co bined viewpoint of parents, educators, specialists in child heal and other interested groups has been described in an editor in *Today's Health*. Similarly the Medical Consultant has p ticipated in the activities of the American Academy of Pediatr in its consideration of health problems in children's recreatio camps and the revision of health examination forms used in su places.

As a means of promoting interprofessional and interagen relations between the American Medical Association and educational and health agencies concerned with school heal community organization and health promotion, both Consulta are active in the work of many associations.

For the fifth year the consultants have prepared discussi questions on the articles in *Today's Health* to aid teachers using the Association's health magazine as classroom hea education material. The questions are developed for each is published during the school year and sent to all interes schools.

The two exhibits on school health prepared in previous ye are still in demand and are available for showing at ann meetings and conferences of interested organizations.

BUREAU PUBLICATIONS

Based on Order Department reports, the distribution Bureau publications showed a significant increase this year. total of 534,977 stock pamphlets and reprints of *Today's Hea* articles were distributed.

Pamphlet advertising and promotion were given special att tion during this period. By authorization of the Board of Tr tees, advertising space was contracted for in outside publicati and six two-thirds page insertions were made in *Today's Heal* While the direct sale of pamphlets from the advertising coup was not substantial, catalog requests from the "Free For T Asking" columns were encouraging. Coupon sales represent dividual orders, partly from teachers and industrial nurses w are prospective quantity purchasers.

Apart from advertising, the main pamphlet promotion eff was an industrial promotion campaign to reach nurses in ind try for the large scale purchase of Bureau publications a subsequent distribution among industrial employees.

Forty-six new publications were added in the past year, cluding two mental hygiene booklets on infants and oldsters w pictures and captions in the "White Collar Zoo" style. Speci inexpensive, throw-away dodgers on heart disease, colds, good foods and weight reduction were prepared for use at state fairs and similar meetings. Twenty pamphlets were revised and three discontinued.

COOPERATIVE RELATIONSHIPS

National Conference on Cooperation in Health Education.—The annual meeting was held at the Cleveland Health Museum, Jan. 25 and 26, 1951, and was concerned mainly with the discussion of relationships of member agencies to various phases of health education work.

U. S. Children's Bureau Advisory Committee on Maternal and Child Health and Crippled Children's Services.—No meeting of the Advisory Committee was held during the year. The Committee had several *ad hoc* meetings of technical people on specific subjects. A five-day joint meeting with staff members of the Public Health Service, the Office of Education and the Children's Bureau was held during the week of Jan. 8, 1951, to discuss school health services.

American Public Health Association Committee on Professional Education.—This committee continues its work in the development of standards of education and performance for public health personnel, accrediting of schools of public health and attacks on the grave questions of personnel shortages, insecurity of tenure, political domination and inadequate remuneration, which seem to be the major obstacles toward the recruitment of properly trained personnel in adequate numbers. The annual meeting was held in St. Louis, Oct. 30, 1950.

American Association of School Administrators.—The second meeting of the Yearbook Commission to revise the 1942 Yearbook "Health in Schools" was held at American Medical Association headquarters in March. This Yearbook will be more of a rewriting than a revision, but like its first edition the book will contain material and will recommend policies and procedures highly acceptable to physicians. The book is scheduled to appear in November 1951.

National Committee on Boys and Girls Club Work (4-H Clubs).—The work of this committee proceeded as usual, with the annual meetings in December. The membership in Four-H Clubs continues to grow, and emphasis on the health aspects of the program is strong.

National Society for the Prevention of Blindness.—Meetings of the Board of Directors, on which the Director of the Bureau serves as a member, were held in New York, Dec. 14, 1950 and April 26, 1951.

American Diabetes Association.—The Director continues as liaison representative of the American Medical Association to the Board of Directors of the American Diabetes Association and has participated in policy discussions relating to the plan of organization, the early diagnosis campaign, and the educational activities of the Association.

American Cancer Society.—In November, 1950, the Director of the Bureau requested the Board of Trustees to withdraw his name from the Professional Education Committee of the American Cancer Society and substitute for him someone qualified in the field of medical education rather than health education of the public. The Board of Trustees appointed Dr. A. F. R. Andresen, Brooklyn, N. Y., to replace the Director.

National Congress of Parents and Teachers, Advisory Committee on Health and Summer Round-Up.—A meeting of this Advisory Committee was held in Chicago, April 17, 1951. The purpose of this meeting was to review material on health contained in the national chairman's "Plans of Work, 1949-52" with the idea of incorporating changes for publication in the next edition, to be printed in the Spring of 1953, as well as to review the more popular pamphlet on the Summer Round-Up of the Children. It was agreed that "Plans of Work" should include immunization against tetanus and a more specific definition of the age at which the various immunizating agents should be administered. It was agreed that an effort should be made by the subcommittee to obtain an acceptable joint opinion on the age of immunization from the American Public Health Association, the American Academy of Pediatrics, the American Medical Association and the U. S. Public Health Service. The importance was emphasized of good health appraisal practices and the possible conservation of physician time by allowing a single examination of health appraisal to serve for the school examination, preparation for athletic and physical education activities, preparation for camps and all of the other activities preceded by physical appraisal.

National Committee for Traffic Safety.—The Director of the Bureau was appointed to the Executive Committee of the National Committee for Traffic Safety. A meeting was held in Washington, D. C. on June 15.

Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association.—The Committee, which was established in 1911 at the suggestion of the American Medical Association, this year celebrated the 40th anniversary of its founding. Now composed of five representatives of each of the present organizations appointed by their respective governing bodies, its chief function is to consider principles and policies and to make recommendations on problems affecting the health of children and youth.

The annual meeting of the Committee was held at American Medical Association headquarters, March 12 to 14, 1951. Among problems considered were methods of keeping current the more than twenty publications which the Committee distributes, completion of a new brochure on the health aspects of physical education and initial action toward the development of a book on school health services. The latter project, approved by the governing boards of both associations, is to be a companion volume for the authoritative text "Health Education" first produced by the Committee in 1924 and revised several times since that date. Interim subcommittees to take appropriate action on this project and other problems were appointed to function between annual meetings of the group.

Publications of the Joint Committee, including the 1948 edition of Health Education, are available from either the American Medical Association or National Education Association.

The Committee recommends that: (1) Physicians, educators and public health personnel be urged to submit pertinent school health problems to the Committee for consideration and appropriate action; (2) Extensive use of the recommendations of the Committee be made as a means of guiding the development of school health programs along sound lines; (3) Every effort be made to stimulate wider distribution of the publications and statements of policy adopted by the Joint Committee, and (4) Education and medical groups be encouraged to establish cooperative relationships at state and local levels to provide for joint action in improving school health programs.

Cleveland Health Museum.—The Director of the Bureau was reelected to the National Advisory Council by the Board of Trustees of the Cleveland Health Museum at its May, 1951, meeting.

United States Government Agencies.—The Bureau continues to cooperate by correspondence, or otherwise, with numerous government agencies, to which materials or information have been furnished during the past year.

MISCELLANEOUS

A new committee on protection of research was appointed by the Board of Trustees to consist of the Secretary of the Council on Medical Education and Hospitals, the Director of the Bureau of Legal Medicine and Legislation, the Director of the Bureau of Investigation and the Director of the Bureau of Health Education. This committee is in addition to and does not replace the previous Committee for the Protection of Medical Research. With the advice of these two committees, the Bureau revised the rules governing care and use of animals in scientific research laboratories. A supply of the revised rules is in stock and available for distribution on application to the Bureau of Health Education.

Report of the Bureau of Investigation

During the year ended Aug. 31, 1951, the Bureau of Investigation has made particular effort to cooperate in the public relations field by bringing its message on the evils of nostrums and quackery direct to the consumers in the form of lectures and public exhibitions.

The Director has appeared before Kiwanis and Lions clubs, church groups, parent-teacher associations, trade groups, women's clubs, chambers of commerce and a county medical society, presenting an illustrated lecture on Mechanical Quackery. New kodachrome® slides have been prepared and new gadgets have been added to the collection, which are demonstrated. There have been 45 such presentations, for the most part in and near Chicago. These have been particularly well received. Each talk has been prefaced by a thumbnail description of the organization and the functions of the American Medical Association as they apply to the physician and the lay person. A paper on current campaigns against medical quackery was read before the Federation of State Medical Boards in February. The Director also appeared on television and radio on quackery subjects early this year.

In cooperation with the Bureau of Exhibits, a newly designed exhibit of fake medical devices was shown to large audiences at the Missouri and Indiana state fairs. These showings were under the auspices of the state medical society, and excellent cooperation from the state secretaries made the exhibits particularly effective. The older exhibit was shown at French Lick, Ind., at the meeting of the Indiana State Medical Association in September, 1950.

During the year the facilities of the Bureau have been used by popular magazine writers seeking data on particular cures or products claiming to have therapeutic worth in the proprietary field.

Four reports were published in THE JOURNAL under the auspices of the Bureau this year. These reports have been less frequent than in years past, but the subjects have been reported primarily on the basis of interest shown by way of inquiries on the subject. It is planned, however, to have more frequent Bureau reports on items of current interest in THE JOURNAL and *Today's Health* in the future.

The Bureau has continued its regular function of answering inquiries on the subjects on which it maintains files of information. More than 3,600 letters were sent out, giving such information on approximately 4,300 subjects. Physicians constituted the largest single number of inquirers, and inquiries from sufferers or their families or friends were the next largest category. Other groups included government agencies, newspapers and magazines, Better Business Bureaus, students and teachers.

The greatest number of subject inquiries was on the cancer quacks. These men appear to be doing a land office business. Several new treatments for cancer have made their appearance, and some of the older ones are more active than ever before. None of these, however, has any proved scientific merit. Second in volume of inquiry have been the vitamins, which currently are being promoted heavily as magic cure-alls in newspaper and other advertising. Rheumatism "cures" and reducing preparations follow in order of frequency.

During the year the Bureau has had considerable turnover in clerical assistants. As a result, the work of the Bureau has been hampered, but every effort is made to answer all inquiries promptly and to investigate any new "cures," treatments, and ideas when their existence is brought to light, usually by inquiry. This work appears to be effective from a public relations standpoint, and every effort is being made to maintain the position which the Bureau has had in the past.

Report of the Bureau of Exhibits

The activities of the Bureau of Exhibits include (1) the Scientific Exhibit at Annual and Clinical Sessions administered by the Committee on Scientific Exhibit of the Board of Trustees; (2) arrangement for Section meeting rooms at Annual and Clinical Sessions in cooperation with the Council on Scientific Assembly; (3) Association exhibits depicting the activities of the American Medical Association at medical meetings, fairs and expositions, in cooperation with the various Councils and Bureaus of the Association; (4) motion pictures, administered by the Committee on Medical Motion Pictures and (5) miscellaneous activities.

THE SCIENTIFIC EXHIBIT

CLINICAL SESSION—CLEVELAND

The Scientific Exhibit at the Cleveland Clinical Session was not large, consisting of 70 exhibits and demonstrations, but it elicited much favorable comment. Space was available to give each exhibit the necessary facilities, and wide aisles prevented overcrowding. Among the popular features were the manikin demonstrations on problems of delivery, the informal talks on diabetes, the fracture demonstrations and a group of exhibits c cancer.

Motion pictures were shown in a room adjacent to the hibits, 14 carefully selected films being shown once each d The entrance to the motion picture theater was next to that the television theater, thus allowing physicians the opportur of comparing the relative merits of these two forms of vis education.

Following the meeting, a questionnaire was prepared in operation with the Council on Scientific Assembly and sent 500 physicians who had attended the Cleveland Session, names being selected at random from the registration cards.

From 347 questionnaires returned, there were 347 replies c cerning the Scientific Exhibit. Apparently every physician atte ing the Session visited that feature. The replies indicated 5% did not attend any lecture, 10% did not see television 22% did not see any motion pictures. The Scientific Exh was rated "excellent" or "good" by 92% of those who atten on the same basis, physicians who attended other features ra "excellent" or "good" the general lectures and clinical prese tions 90%, the motion picture program 88% and the televis program 80%. Physicians appreciated the opportunity to disc their problems with exhibitors and demonstrators.

THE SCIENTIFIC EXHIBIT

ANNUAL SESSION—ATLANTIC CITY

The Scientific Exhibit at the Atlantic City Session was of the largest in the history of the Association and, in gene *quality of material and in teaching value*, was one of the b The location on the lower level of Convention Hall allowed wider aisles, less crowding and a general atmosphere of seri study. In spite of certain disadvantages, the arrangements seem to meet with general approval.

There were 436 signed applications for space, besides nur ous inquiries which were discouraged because of no possib of space being available. Two hundred and ninety-seven exh were shown in 306 booths.

There were several popular features. A group of exhibit overweight, nutrition and health, together with a question *answer conference, was shown for the first time. Another* presentation was a group of exhibits on noise in industry. fracture exhibit, the fresh pathology exhibit and the dial conferences, all of which have been repeated many times, as popular as ever.

The Section representatives to the Scientific Exhibit rend a vast amount of assistance in the procurement and selectic outstanding exhibits. Each Section had a group of exhibits taining to its specialty, but the endeavor was to make the of interest to the physician in general practice rather than specialist.

Motion pictures were shown as part of the Scientific Ex program in two large rooms on the main floor of Conve Hall, adjacent to the Technical Exposition. Thirty-eight were presented once each day during the week, with the au of 11 films being present to discuss them. The films were sel with the cooperation of the Committee on Medical M Pictures from more than 100 applications, and all of the were previewed by competent authorities. The attendance excellent, several hundred persons often being present t the most popular films.

The Committee on Awards, consisting of Drs. O. P. J. St. Louis, Chairman; Keith S. Grimson, Durham, N. C.; H. Holinger, Chicago; Leonard A. Scheele, Washington, D and W. Walter Wasson, Denver, awarded seven medals— gold, two silver, and two bronze. In addition, a certificat merit was awarded to the best exhibit in each Section, toge with one or more honorable mentions.

Numerous recommendations were made by visiting ph cians for some method to preserve the vast amount of scien information collected in the Scientific Exhibit. The Commi on Scientific Exhibit has these recommendations under sideration.

ASSOCIATION EXHIBITS

The Bureau of Exhibits has endeavored "to promote science and art of medicine and the betterment of public heal by exhibits showing the activities of the various Councils ureaus of the American Medical Association on subjects in hich those departments are interested. The list of exhibits vailable for loan purposes includes 49 subjects. During the ar, several new exhibits were built, while others were refurished and brought up to date. Several exhibits were disconnued and others will soon be worn out and must be replaced. ssociation exhibits have been scheduled for the year at 75 eetings and other gatherings. During the first six months of 51, they were shown for a period of 708 days in 28 states and laska. The Bureau continues to advise and assist state medical ssociations in the preparation of their own exhibits when quested.

Medical Exhibits.—Medical exhibits have been scheduled for 0 meetings of medical societies or other scientific organizations. each instance a qualified demonstrator accompanies the khibit, usually a member of the Council or Bureau whose work being shown.

In cooperation with the Secretary's Office, the Council on edical Service, Council on Medical Education and Hospitals, epartment of Public Relations and other departments of the ssociation, the Bureau of Exhibits has developed an extensive xhibit entitled "You and Your A. M. A." The exhibit was creted especially for showing at state medical society meetings to quaint members with the services available from the American edical Association, its functions and health education and ublic relations activities. The exhibit is staffed by representaves from the central office who are thoroughly familiar with e American Medical Association. The exhibit forms a part of integrated program to bring the American Medical Assocition to its individual members.

Health Exhibits.—Health exhibits at fairs and expositions ontinue to be popular. State and county medical societies, or rganizations which are approved by such medical societies, orrow the exhibits and demonstrate them. Only rarely does representative from the headquarters staff accompany an khibit, the chief exception being the exhibit on mechanical uackery.

During the year, health exhibits were scheduled for 45 fairs nd expositions with audiences running into the hundreds of ousands. The serious search for health information by visitors fairs and expositions, and the appreciation expressed by such isitors, attests to the value of this method of health education. he opportunity of reaching large numbers of persons who are a receptive mood is most valuable.

County and state medical societies approaching their fiftieth, venty-fifth and centennial anniversaries seek the counsel of e Bureau in the presentation of Halls of Health, Health Cennnials and similar public demonstrations. The Bureau is happy be of assistance to the societies since such an event offers an ccellent opportunity for the profession to discharge its avowed jective to promote "the betterment of public health" and to ail itself of the opportunity to execute an excellent public lations program.

Health Museums.—The Association has on semi-permanent an several health exhibits to health museums in Chicago, leveland, Washington, D. C., and Dallas, Texas, in addition the health exhibits listed above. The outstanding health useum in the United States is the Museum of Science and dustry in Chicago. That Museum has devoted several thounds of square feet of floor space to health exhibits which e on display seven days a week throughout the entire year. e attendance of school groups, tourists and other visitors from e United States increases the total attendance each year to arly two million. The health exhibits are supervised by a edical committee of which Dr. A. C. Ivy is chairman, and the irector of the Bureau of Exhibits serves as executive director.

Health museums in other cities are under consideration and ery assistance within the resources of this Bureau will be ven to them.

COMMITTEE ON MEDICAL MOTION PICTURES

The many and varied services offered by the Committee on edical Motion Pictures have been enlarged and expanded and assistant and an additional typist were added to the staff.

Film Library.—Eight new films were added to the motion cture film library, the revised catalog now listing a total of 62 subjects. Copies of the new catalog were sent to the secretary of each county and state medical society and woman's auxiliary and to the dean of each medical school. Fourteen hundred forty-eight film shipments were made to various medical groups.

Film Reviews.—One hundred eight motion picture reviews were released to the Editorial Department, 98 of which have been published in The Journal. This represents a 27% increase in number of reviews published in 1950. A supplement to the second revised edition of the Booklet of Reviews was prepared, including all reviews published in The Journal during 1950. Complimentary copies were sent to the secretary of each state medical society and to the dean of each medical school and were also made available to county medical societies.

Film Source File.—The source file of medical motion pictures now contains information on over 2,500 films. This continues to be the basic source of information from which the committee is able to provide answers to the many hundreds of inquiries received each year from individual physicians, medical societies, medical schools and other scientific groups. During the past year, it was completely revised and expanded and a new section added, listing the addresses of all state health departments which maintain film libraries.

The mimeographed lists of films on special subjects total over 100 in number. These lists are constantly being revised and kept up to date. Film catalogs from all state health departments are on file and are used to direct requests for specific health films to local sources.

Special Projects.—Preliminary investigations on the effectiveness of motion pictures in medical education will be conducted through an appropriation of $2500.00 from the Board of Trustees. A research subcommittee of educators, audiovisual specialists and educational psychologists will be appointed in order to establish basic criteria under which controlled research studies might later be conducted in medical schools.

A cooperative program for cataloging films has been agreed on by the Committee on Medical Motion Pictures of the American Medical Association, the motion picture committee of the American College of Surgeons, and the Medical Film Institute of the Association of American Medical Colleges.

The secretary of the committee visited Mexico City in February at the request of the American Embassy in Mexico. The purpose was to explain to the medical profession of Mexico City, the motion picture program of the American Medical Association, to discuss the use of motion pictures in medical teaching and to explore the possibilities of making medical films more readily available to the medical profession in Mexico.

The Committee has prepared a list of fifty American made motion pictures at the request of the British Medical Association, which would be of special interest to the general practitioner of Great Britain. The British Medical Association is considering the possibility of including these films in their motion picture library.

Surveys.—During the past year, the Committee has conducted several important surveys, the purpose being to promote the effective use of motion pictures, to determine the extent and use of films within the various branches of medicine and to discover some of the problems which retard the expanded use of this medium.

1. A preliminary survey of health films cleared for use on television was made in response to requests from groups such as state and county medical societies. The results indicated that there was a need for a more detailed and expanded list of such films. A second survey of 81 sponsors and producers was carried out, and a list of 179 films was prepared with instructions for ordering the films. Copies were sent to the secretary of each state medical society and woman's auxiliary, to the program director of each television station and to more than 400 other persons who requested the list. Realizing that the value of the list would be enhanced if each available film were screened and critically evaluated, the Committee, in cooperation with the Bureau of Health Education, has begun a systematic evaluation program.

2. A questionnaire to determine which pharmaceutical houses sponsor films, how they distribute them and their attitude and policy relative to distribution to foreign countries was sent to 170 pharmaceutical companies. The replies contained much

practical information relative to films previously unknown as well as specific information which will prove to be valuable source material for the Committee as it is increasingly consulted by sponsors and producers on problems of production and distribution.

3. A series of questions relative to the use of motion pictures in medical schools was included in the recent survey conducted jointly by the American Medical Association and the Association of Medical Colleges. The Committee on Medical Motion Pictures received permission to extract this information from the completed questionnaires submitted by 41 medical schools. In general, the results indicated that there is no longer a lack of projection equipment or personnel to operate the equipment. Further, it appears that the main problem encountered centers about a lack of good films, especially in certain subject areas, and to a lesser extent the lack of interest in this medium by certain of the faculty members. The results quite definitely point toward a need for better planning of production in the medical motion picture field.

Other Projects.—The motion picture entitled "They Also Serve," prepared by the American Medical Association in 1949, was shown on a CBS television program under the sponsorship of the Civil Defense Administration. A copy of this picture has been purchased by the Administration for regular showings at the Civil Defense Staff College in Washington, D. C.

MISCELLANEOUS ACTIVITIES

Members of the staff have given unstinted service on numerous matters connected with visual education, both in graduate medical instruction and in health education. They have had numerous conferences with representatives of medical societies in the United States and in foreign countries. They have lectured, prepared material for publication, served on committees and reviewed books for THE JOURNAL and *Today's Health.* They have cooperated with the other Councils and Bureaus of the Association, integrating activities so that the American Medical Association is a complete unit.

The sixth edition of the Primer on Fractures was published during the year.

Report of the Bureau on Medical Economic Research

The demand for publications of the Bureau of Medical Economic Research was not as great during the 12 months ending Sept. 30, 1951, as it had been during the preceding 12 months, but the number of items published was greater. During the past 12 months Bulletins 79 to 86 and miscellaneous items M-38 to M-53 were published.

During the year now ending, 187,000 copies of Bureau bulletins and 186,000 copies of miscellaneous items were sent out to medical societies, physicians, schools, various organizations and individuals. The total, 373,000, compares with the total of 479,000 reported for the year ending Sept. 30, 1950. This decrease apparently reflects the decline in public interest in controversial aspects of medical economics.

SUMMARY OF PUBLICATIONS

Since the primary function of the Bureau is research, a brief summary of the publications will describe most of the work of the Bureau during the past year. A one sentence summary of each publication, by number, follows: (79) Continuing the downward trend, in 1949, for the first time, a large nation, the United States of America, lowered its maternal mortality rate to slightly below the apparently irreducible minimum of one death per 1,000 live births; (80) this new bulletin on medical service areas gives the population, square miles and primary centers of each area and includes a medical service area map of the United States; (80A) this supplement to Bulletin 80 lists the towns by medical service area numbers in those counties which are divided into two or more medical service areas; (81) supply of physicians' services—increased output of physicians through better roads, transportation and communication, technological progress, medical auxiliary personnel, decline in house calls and cooperation between physicians; proved medical progress in such fields as maternal mortality, infant mortality and life expectancy; and the lack of undue rises in physicians incomes indicate there is no nationwide doctor shortage; (82) seven representatives of different types of blood banks in widely scattered cities related their experiences in the establishment and operation of their ba guides to community leaders who are trying to choose th of blood bank best suited to their communities; (83) this s survey of blood banks presents revised national estima blood used by hospitals, in direct transfusion, blood ob for storage, and normal and emergency bleeding capacity, with a directory of hospital blood banks, non-hospital banks, and Red Cross Regional blood centers; (84) 30,000 in the survey of the 1949 incomes of physicians, unde jointly by the Bureau and the U. S. Department of Com indicate that physician incomes have increased about as as the average income of the American people during in with the increase resulting from better collections, greate put per physician" through use of technical help and a mo rise in fee schedules; (85) this annotated bibliography of and books on group practice, 1927-1950, is a revision of B 63; (86) since the price of medical care had risen by 195 48% above the 1935-1939 level while the cost of living ros medical care in terms of the purchasing power of the doll 14% cheaper in 1950 than in 1935-1939.

The short items, usually multigraphed or multilithe termed miscellaneous (M); some of them are reprints of paper items about Bureau publications. (M-38) includes bank developments from July 1 to October 1, 1950, the the "Boston Agreement"—an agreement covering interre in time of peace and of national emergency between the can National Red Cross, the American Medical A the American Association of Blood Banks and the Am Hospital Association—and the texts of the official assig given the Red Cross by the Department of Defense a National Security Resources Board, together with the ances by the American National Red Cross; (M-39) a of the *Chicago Daily News* article quoting the American cal Association view that mass blood typing is inadv (M-40) a letter from Dr. Andrew C. Ivy, concerning mass typing and an answer by Dr. Leonard W. Larson, Chair *the Committee on Blood Banks; (M-41) reproduces the* from the *Bay City Times* (Michigan) stating that Surgeo eral Leonard A. Scheele believes mass blood typing w a waste of time; (M-42) a reprint of a *Champaign-* *Courier* account of a local address by Senator Paul H. during the local campaign attacking the AMA lobby; the evolution and growth of voluntary health insurance *their advantages over compulsory plans and former* p ment methods, and their present limitations are given; the Report of the Committee on Blood Banks and the of the Reference Committee on Emergency Medical approving the committee's findings and recommen (M-45) a letter from Dr. George F. Lull to *Collier's*, su by a chart, refutes the claim of the *Collier* article tha is an alarming doctor shortage; *(M-48) letter to the edit* menting on the inadvisability of mass blood typing, re from *American Journal of Public Health;* (M-49) a lon by Dr. Paul I. Hoxworth, President of the American tion of Blood Banks, showing the difficulties encount carrying out the terms of the "Boston Agreement" a gesting ways by which blood banks may solve their loc lems; (M-50) a paper read by the Director at the Marc meeting of the Fraternal Actuarial Association—since 1 population of the United States has doubled through progress and other improvements but in the same per number of persons 65 years of age and over quadrupled, b three main social changes; (M-51) a reprint of an edit the survey of physicians' incomes from *The Sunday* (Philadelphia); (M-52) is a reprint of an editorial, "Keep Family Together" in THE JOURNAL Sept. 8, 1951.

OTHER ACTIVITIES

The Director made 19 addresses to a variety of organi and has supplied speech material to several physicians. S were delivered before meetings of the Woman's Auxiliary State Medical Society of Wisconsin, seventieth annual of the South Dakota State Medical Association, A Academy of General Practice and the seventy-third ann sion of the Montana Medical Association, and to cla Amherst College and Yale University. An address given the Thirty-Second Annual Clinical Session of the Americ ge of Physicians was scheduled to be published in the October 951 issue of the *Annals of Internal Medicine.* A paper given efore the Southern Conference on Gerontology at the Univerity of Florida was published by the University and reprinted s M-53 by the Bureau. The Director also addressed the 1950 nnual meeting of the American Medical Writers' Association; his address was published in the *Mississippi Valley Medical ournal,* January, 1951. The paper given before the 1949 Amerian Public Health Association Annual Meeting was published y the *American Journal of Public Health,* May, 1951, and also s M-43 by the Bureau. The Director assisted in arranging and articipated in two sessions on medical economics at the Deember 1950 meeting of the American Economic Association.

Cooperative activities with other headquarters' departments ontinue to expand. During the year 27 items were published in HE JOURNAL; these included book reviews, current comments, ditorials and articles. Four editorials were published in *Today's ealth.* A considerable number of manuscripts involving statisical procedures were submitted to the Bureau by the Editor of HE JOURNAL. Statistical aid was given to staff members of everal bureaus and councils. The Director continued to cooprate with the Director of the Bureau of Legal Medicine and egislation in efforts to provide tax relief for self-employed hysicians in making provision for their pensions.

The I. B. M. machines and personnel were used in the preparation of some of the longer tables in the Bureau's publications, articularly in the survey of blood banks. The random selection f the 125,000 physicians contacted in the survey of physicians' ncomes and the addressing of envelopes was an I. B. M. operaion. The tables in the Hospital and the Internship and Residency umbers of THE JOURNAL and many tables for the Committee n Research for its cancer study were prepared by the I. B. M. ection. *At the present writing it appears that before December* 1, 1951, the huge I. B. M. file on physicians, which is coextensive vith the Directory Department file and the Directory Supplenents, will be current; thereafter the continuing task will be to eep the file current. A duplicate set of punch cards on all hysicians in the United States, Canada and United States posessions, coinciding with the 1950 American Medical Directory as been sent for safe storage to a fire proof warehouse about 0 miles from American Medical Association Headquarters.

Report of the Assistant to the General Manager Department of Public Relations

A special committee consisting of Drs. Gunnar Gundersen, Chairman, Edwin S. Hamilton and B. R. Kirklin was appointed by the Board of Trustees in December 1950 to study the public relations facilities and program of the Association. As a result of the committee's study Mr. Leo E. Brown was placed in charge of the Department of Public Relations, as Director, on March 1, 1951, and Mr. Lawrence Rember, former Director, was named as head of Field Service for the Department.

PUBLIC RELATIONS COMMITTEE

Shortly after the special committee had made its report, the Board of Trustees established a permanent Public Relations Committee, to be composed of three members from the Board of Trustees and two from the House of Delegates. The present members are Drs. Gunnar Gundersen, Chairman, Edwin S. Hamilton, Walter B. Martin, B. R. Kirklin and Truman C. Terrell.

ADVISORY COMMITTEE OF STATE MEDICAL ASSOCIATION EXECUTIVES

An Advisory Committee to the Director of the Department of Public Relations, composed of executive secretaries or public relations directors of constituent state medical associations, was appointed in April 1951 to advise the Director on the public relations needs of the constituent associations and on the over-all public relations program of the American Medical Association. The members of this Advisory Committee are:

Mr. Harvey T. Sethman, Chairman, Executive Secretary, Colorado State Medical Society.

Mr. Charles S. Nelson, Executive Secretary, Ohio State Medical Association.

Mr. Hugh W. Brenneman, Public Relations Counsel, Michigan State Medical Society.

Mr. John Hunton, Executive Secretary, California Medical Association.

Mr. Richard H. Graham, *Executive Secretary, Oklahoma State Medical* Association.

Mr. Frederick W. Miebach, Director, Public Relations Bureau, Medical Society of the State of New York.

Mr. Charles H. Crownhart, Secretary, State Medical Society of Wisconsin.

Mr. Ray E. Smith, Executive Secretary, Indiana State Medical Association, who died reently, was also a member of the Advisory Committee.

The committee held three meetings during the year. Its sound advice and counsel were of inestimable value in the implementation of the 1951 public relations program and in outlining the program for the coming year.

PUBLIC RELATIONS OBJECTIVES

The objectives of the American Medical Association public relations program during 1951 were threefold: (1) To serve and to inform adequately the members of the American Medical Association of the true ideals of the Association and the value of membership therein, thus soliciting their active support of its policies and program; (2) to convince the public that the medical profession is not only sincerely and actively concerned in seeing that high quality medical care is available to each community but also sincerely and actively concerned in seeing that such care is available when and where needed at a cost in keeping with each individual's economic status or without cost in unusual and extenuating circumstances, and (3) to encourage and assist state and county medical societies to continue and expand their public relations activities thereby cementing physician-patient and community relationships at the grass roots.

PRESS RELATIONS

The Press Relations Department in the last year functioned on a broader scale than ever before. Demands of newspapers and radio stations for constructive medical news continued to increase, with the result that the department's weekly news releases found wider public outlet the nation over. The News Release now is sent to 1,350 newspapers, magazines, wire services and science writers across the country. More newspapers assigned full-time men to medical reporting, and these looked to the American Medical Association for authoritative information. This was especially apparent at the annual meeting in Atlantic City which was attended by 79 writers representing 59 publications.

This wide dissemination of scientific advances in medicine played an important role in the fight against socialization. It gave editors constructive material which demonstrated to the public that the health of the people is being protected by the medical profession under an American system of enterprise.

Scientific articles in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, *Today's Health,* and the various specialty journals were given wide publicity. The activities of the Association were reported. Meetings of councils, committees and bureaus were publicized nationally.

What the medical profession is doing to increase the supply of doctors, to expand medical education, to eliminate grievances and to provide emergency services was well played up in newspapers and magazines and on radio all over the country. The information was supplied largely by the Department of Public Relations.

MAGAZINE RELATIONS

In 1951 national magazines devoted more and more space to articles on medicine and health. To keep pace with this trend, the Public Relations Department placed new emphasis on service to magazine editors and writers. In the first nine months of the year 58 editors and free lance authors received special assistance with writing projects. Articles written by these authors appeared in 35 mass circulation magazines with almost every top-ranking national publication represented. A manuscript review service inaugurated during the year offers a pre-publication check of magazine articles by American Medical Association staff physicians. Twelve medical articles were submitted for this check on accuracy, and the majority of the suggestions offered were adopted.

SESSION DAILY BULLETIN

In June 1951 the Public Relations Department assumed responsibility for the Daily Bulletin published during annual and clinical sessions of the American Medical Association. To make it a more effective public relations tool, the Daily Bulletin was issued in the form of a tabloid newspaper with special attention given to topography, layout and news coverage. Spot news photographs of Session events and personalities appeared in each issue.

FIELD SERVICE

The addition of a full-time Director of Field Service made it possible for the Department of Public Relations to serve more adequately the constituent state medical societies. During 1950 members of the Public Relations staff visited 31 state medical societies and numerous county societies, assisting in the planning and implementation of their public relations programs and discussing the goals, services and accomplishments of the American Medical Association.

A demonstration public opinion survey was conducted in Decatur and Macon County, Ill. The survey included personal interviews with 125 community leaders and 175 households. Questioned on the medical care received, its cost and quality, attitudes about doctors, the medical society and the health institutions delivering medical care, Macon County residents revealed the most common medical public relations problems. The results provided the American Medical Association with a test check against its own evaluation of public thinking. The survey report was made available to county medical societies for comparison, evaluation and guidance in conducting similar studies.

The Field Service program has received the commendation and appreciation of constituent associations served. Greater demands are being made for this service, and every effort is being exerted to comply.

LITERATURE

This year the Department of Public Relations has gone into the production and mass distribution of literature for the first time. The department produced two pamphlets. One, "A Doctor for You," designed for the general public, tells the story of the profession's efforts to graduate more and better physicians. Over one-half million copies have been distributed to people in all parts of the country.

The second pamphlet, "It's Your A. M. A.," was designed for physicians, and conducts the reader on an imaginary tour of Association headquarters, acquainting him with the many services the American Medical Association renders to its members. This pamphlet was mailed to all physicians in the United States. It will also be sent to all new members on receipt of their dues.

In addition to these two pamphlets, the department published a comprehensive "Guide to Services of the American Medical Association." This revision of the American Medical Association Handbook, containing many new features, will be brought up to date annually. It is intended primarily for officials of state and county medical societies and other organizations which have frequent contact with the Association.

The Department of Public Relations also made good use of an excellent crop of popular magazine articles, reprinting and distributing them widely. These were "Your Doctor for a Friend" and "What About This 'Doctor Shortage,'" both by Paul de Kruif and both reprinted from *Reader's Digest;* "The Doctors Clean House," by Alice Lake, reprinted from the August *American Magazine;* "How to Get a Doctor," by John E. Eichenlaub, M.D., reprinted from the April *Farm Journal;* "I'm a Doctor and I'm Human," by Robert K. Webster, M.D., as told to Greer Williams, reprinted from a fall 1951 issue of the *Saturday Evening Post,* and "A Doctor as Near as Your Telephone," by William F. McDermott, reprinted from the November, 1951, *Reader's Digest.* Approximately 3,000,000 pieces of literature were distributed to the profession and general public during the past year, including more than 1,000,000 copies of "What About This 'Doctor Shortage.'"

PR DOCTOR

PR Doctor, the bimonthly medical public relations news letter published by the department, has continued to promote public relations programs on the state and county levels during 1951. The medical man's own public relations piece, *PR Doctor* ou lines medical public relations goals, transmits public relatio ideas of other medical societies in case history form and offe guidance on public relations methods and materials. More th 1,400 state and county medical society executive secretarie state public relations chairmen, state presidents, medical pub relations personnel, American Medical Association officers a trustees, members of the House of Delegates, state medical jou nal editors and allied groups receive the news letter. The e change packet, which carries samples of materials described the news letter, is distributed to a limited mailing list of st and county medical society executive secretaries. As the res of many requests, the news letter mailing will be stepped up between 2,500 and 3,000 in 1952 to cover every state and cour medical society in the nation.

SERVICE TO COUNCILS, COMMITTEES AND BUREAUS

Throughout the year the department is called on to public activities of American Medical Association departments, co cils, committees and bureaus and to counsel them on the pub relations aspects of their programs.

The following conferences were publicized via newspape magazines, house organs, radio and television: Rural Hea Conference; Industrial Health Conference; Congress on Medi Education and Licensure; National Conference on Medical Ci Defense; National Conference on Physicians and Schools, a annual meeting of the Student American Medical Associatio

PUBLIC RELATIONS CONFERENCE

The fourth annual Medical Public Relations Conference w be held prior to the Clinical Session in Los Angeles. This yea conference will highlight medicine's major public relations pr lems as revealed by a letter query of state medical associatio Answers almost unanimously listed the cost of medical care a physician patient relationships as the chief public relations he aches. Results of three public opinion surveys will be presen to inform the conference on what the general public thinks the medical profession and the medical services they recei Work sessions on prepayment and postpayment of medical bi catastrophic sickness insurance coverage, fees, itemized bills a waiting room problems are on the schedule. A transcript of conference proceedings will be made available to county a state public relations committees and other interested individu

OFFICE PLAQUE

Realizing that many of medicine's public relations probl are the result of misunderstanding, the department made av able to all physicians an office plaque which invites the pati to discuss services and fees frankly. The plaque reads:

To All My Patients

I invite you to discuss frankly
with me any questions regarding
my services or my fees.
The best medical service is based
on a friendly, mutual under-
standing between doctor and patient.

Physicians were encouraged to purchase this plaque at dollar and display it prominently in their waiting rooms.

INTRA- AND INTER-ASSOCIATION ACTIVITIES

During the year many special services have been rendere individual members and state and county medical societies. department has worked very closely with the Secretary and G eral Manager's office in determining the public relations po of the Association. It continues to assist the Secretary and G eral Manager in preparing the Secretary's Letter, one of important channels of communication to more than 3,200 tional, state and county medical leaders. The department has p formed many special services and provided assistance and s gestions in the preparation of speeches and articles for the offic and trustees.

Contacts with other key national organizations, associatio and institutions were cultivated during 1951. A concerted eff has been made to acquaint other national organizations with t objectives, program and accomplishments of the Americ Medical Association.

Dates of Future Sessions

The places at which annual sessions of the Association are to held is decided by the House of Delegates and the places for clinical sessions by the Board of Trustees. The dates for both sions are determined by the Board. Following are the places d dates of annual and clinical sessions from 1952 through 54:

Annual Session, 1952, Chicago, June 9-13.
Clinical Session, 1952, Denver, Colo., Dec. 2-5.
Annual Session, 1953, New York, June 1-5.
Clinical Session, 1953, St. Louis, Dec. 1-4.
Annual Session, 1954, San Francisco, June 21-25.
Clinical Session, 1954, Miami, Fla., Nov. 30-Dec. 3.

Conclusion

A supplementary report will be submitted to the House of elegates which will contain information that will not be avail-le until just prior to the opening meeting of the House.

Respectfully submitted,

Dwight H. Murray, Chairman.
Gunnar Gundersen, Vice Chairman.
Edwin S. Hamilton, Secretary.
Edward J. McCormick.
David B. Allman.
F. J. L. Blasingame.
Leonard W. Larson.
Thomas P. Murdock.
Walter B. Martin.
John W. Cline.
Louis H. Bauer.

REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

the Members of the House of Delegates of the American Medical Association:

The major concerns of the Council on Medical Education and ospitals during the past year have been with matters referred it by the House of Delegates, the securing of additional finan-al support for medical schools through the establishment of e American Medical Education Foundation and the National ınd for Medical Education, the negotiations to develop a joint ogram with other organizations for the accreditation and andardization of hospitals, problems arising from the Korean nflict and the resulting mobilization, the Survey of Medical ducation, problems relating to the internship, including the sparity between the number of internships and the number of terns, the matching plan for the appointment of interns and e broad problem of the status of the internship in modern edical education, and a revision of the Council's "Essentials of n Acceptable Medical School."

At the annual session in Atlantic City in June, 1951, the Coun-l submitted to the House of Delegates a special report on the licy of the American Medical Association regarding the pro-uction of physicians.

MATTERS REFERRED TO THE COUNCIL BY THE HOUSE OF DELEGATES

In June, 1951, the House of Delegates recommended that the ouncil continue its study of preceptorships. It can be reported ıat an increasing number of schools are conducting experiments ith various types of preceptorships. Earlier this year the Coun-il secured detailed information from the nineteen schools that ffer preceptorships and published a summary of this informa-on in the 1951 Educational Number of The Journal. The Sur-ey of Medical Education is also investigating preceptorships nd will present its findings in its final report. It is also planned devote an important part of the program of the 1952 Con-ress on Medical Education and Licensure to a discussion of receptorships.

The Council was also requested to study the problem of the ultiplicity of medical meetings with particular reference to the equirement of attendance at hospital staff meetings. The Coun-il is of the opinion that this problem is one which can be xplored most effectively at the time the newly established Joint ommission on Hospital Accreditation formulates its standards for hospitals seeking its recognition. At the time this report was prepared, the formation of the Joint Commission had just been authorized by the four cooperating organizations and there had been no opportunity to hold a meeting of the Commission. At the proper time in the work of the Commission, the Council will take up this problem and report further to the House of Delegates.

The resolution recommending that general practice residencies provide that at least eight of the 24 months be devoted to surgery and that four of these months should embrace operating room experience, which was referred to the Council for further study, is being considered in conjunction with a possible revision of the Council's essentials of residencies in general practice.

The resolution recommending that the Council distribute standards of qualifications for physicians permitted to apply radium in hospitals will be acted on by the Council at its meeting in December, 1951, at the time of the Clinical Session.

FINANCIAL SUPPORT OF MEDICAL SCHOOLS

Two important new developments have occurred in the past year which promise to contribute significantly to the solution of the acute financial problems that have beset the medical schools since the end of World War II. In December, 1950, the Board of Trustees appropriated a half-million dollars as a nucleus of a fund to be raised by the medical profession during 1951 for the unrestricted use of the medical schools. Shortly thereafter the Association formed the American Medical Education Foundation as a separate corporation to serve as the instrument for raising such a fund annually. The Council wishes to take this opportunity, however, to state its conviction that the establishment of the Foundation represents a notable move which offers promise of becoming of great importance and significance. At the same time the Council urges strongly that all physicians demonstrate their interest in and concern for the maintenance of high standards of medical education by contributing generously and regularly to the Foundation.

The other new development was the public announcement of the establishment of the National Fund for Medical Education. In its last three reports the Council has referred to its joint efforts with the Association of American Medical Colleges to enlist the support of leading citizens for the establishment of a national organization to secure voluntary funds for the support of medical education. After more than two years of preliminary planning and organization, this effort achieved its first goal on May 16, 1951, with the announcement of the establishment of the National Fund for Medical Education. This important new organization is sponsored by outstanding leaders from the fields of public affairs, business, industry, agriculture, labor, higher education and the medical profession. Its affairs are directed by a board of 66 distinguished trustees from all parts of the nation. It has as honorary chairman, former President Herbert Hoover and as president, Mr. S. Sloan Colt, the president of Bankers Trust Company, New York. The trustees are aided by an advisory council composed of leading university presidents, members of the Council on Medical Education and Hospitals and members of the Executive Council of the Association of American Medical Colleges. Mr. Chase Mellen Jr. is executive director of the Fund which has its offices at 475 Fifth Ave., New York.

The objective of the Fund is to raise annually from voluntary sources substantial sums for the support of the nation's medical schools. Emphasis will be placed on securing contributions from corporations and organized groups which it is recognized have to a large extent replaced individuals as the great potential sources of philanthropy in this country. The Fund hopes eventually to raise between five and ten million dollars a year for distribution to all approved medical schools for their unrestricted use.

The closest possible cooperation exists between the National Fund and the American Medical Education Foundation. The activities of these two organizations do not in any way duplicate each other but are intended to and, in fact do, complement each other in a logical fashion. The National Fund is conceived as an agency to raise funds on a wholesale basis from organized groups. The Foundation is designed to raise funds specifically from the medical profession. Indicative of the close relationship between these two groups is the fact that members of the Board of Directors of the Foundation serve on the advisory council of the Fund and that the Board of Directors of the Foundation voted this year to merge the funds it collects with those of the National Fund for distribution by the National Fund to the medical schools. By their combined efforts both organizations hope to provide continued substantial assistance to the medical schools that will greatly reduce the financial problems that have threatened their stability.

While the Foundation and the National Fund in their short history have been able to render only the most modest help to the medical schools, the efforts of the individual schools themselves have had sufficient success to warrant optimism that substantial progress is being made in securing more adequate financial support for medical education. For the coming academic year the medical schools report that their budgets will total $74,350,000 and that they expect to receive an additional $35,250,000 from outside agencies in grants for research and special teaching activities. The schools thus will have a total of $109,600,000 available for education and research during the coming year.

Earlier this year the Committee on Medical School Grants and Finances appointed by the Surgeon General of the Public Health Service published a report of a study it had made of the expenditures and the needs of the medical schools during the academic year 1947-1948. The committee reported that in that year the medical schools spent a total of $70,551,000 for basic operations and for separately budgeted research. This figure did not include the expense of maintaining clinical facilities. Of the total of $109,600,000 available to the schools for the coming year, about $3,250,000 will be used to support clinical facilities. This amount must be subtracted from the total to provide a figure that can be compared with the total expenditure as computed by the committee. When this is done it is seen that the medical schools expect to have available in 1951-1952 approximately $36,000,000 more than they spent in 1947-1948.

The Surgeon General's Committee estimated that the medical schools' unmet needs as of 1947-1948 could be financed only by the expenditure of about $40,000,000 more annually than the schools were then spending for education and research. The figures for the coming academic year indicate that the schools within the short space of four years have secured additional funds almost to the full amount of their need as estimated by the Surgeon General's Committee. It must be pointed out, however, that not all the increase of $36,000,000 is clear gain and that not all schools have shared proportionately. Part of the increase has been offset by loss in the purchasing power of the dollar; some of it has been used to support new or expanded activities not provided for in the estimate of $40,000,000. Account must also be taken of the fact that almost 40% of the gain of $36,000,000 is in the form of funds specifically earmarked for research and therefore not available for the schools' unrestricted use.

The overall picture, however, is one which warrants optimism that progress is being made even if unmet needs and some uncertainty regarding the future remain. Perhaps one of the most important conclusions to be drawn from the foregoing analysis is that the gap between unmet needs and available funds has been narrowed to a point where if the National Fund for Medical Education and the American Medical Education Foundation can provide an annual fund of from five to ten million dollars, the gap that remains for many schools will be all but eliminated. This goal can be achieved only if the medical profession without delay takes appropriate action to insure the continuing success of the American Medical Education Foundation. If this is done the solution of one of the most serious problems that has been encountered in the whole health field in recent years will be at hand.

MEDICAL EDUCATION AND NATIONAL DEFENSE

The problem of adjusting the various programs of medical education to states of partial or complete mobilization continues to occupy the Joint Committee on Medical Education in Time of National Emergency. This committee was formed by the Council on Medical Education and Hospitals and the executive council of the Association of American Medical Colleges two days after the onset of the Korean conflict. Its members are: Drs. Stockton Kimball, Chairman; Joseph C. Hinsey; A. C. Bachmeyer; Dean F. Smiley; George Berry; Herman G. Weiskotten; Harvey B. Stone; Victor Johnson; Donald G. Anderson; Francis R. Manlove, and Mr. John Stalnaker. The liaison members are Drs. B. R. Kirklin; Harold Diehl; Ravid Ruhe Mr. C. Joseph Stetler.

During the past year the committee has undertaken actions of major importance. On Nov. 1, 1950, a state was submitted to the National Security Resources Board lining recommendations for maintaining a flow of well tr physicians adequate to meet the needs of both the armed f and the civilian economy during partial or complete mob tion.

The Joint Committee in November, 1950, appointed a committee on Curriculum consisting of Drs. Stanley W. C Chairman; Charles B. Puestow; John P. Marbarger; H. W Kendell; Franklin C. McLean; Roy R. Grinker; Roger A. vey; Andrew C. Ivy; Gaylord W. Anderson, and G. M.

On Feb. 10, 1951, the Subcommittee returned to the Committee a report entitled "Suggestions for Supplementin Medical Curriculum in Time of National Emergency." Th port, which has been sent to all medical schools, outlines th ject matter the future physician needs for a sound foun for military medicine and the medical aspects of civilian de

On Jan. 10, 1951, representatives of the Council an Association of American Medical Colleges appeared befo subcommittee of the Senate Armed Services Committee t cuss medical education in relation to pending legislatio universal military training and service. On Aug. 17, 1951 Joint Committee appeared before the National Security T Commission to discuss these same problems.

In addition to its participation in the activities of the Committee, representatives of the Council have served o Healing Arts Advisory Committee to the National Selective ice System. The Council has also been active in collectin disseminating information to individuals and institutions r ing the policies of the Selective Service System and the forces particularly as they affect students, interns, resident teachers in the medical schools.

HOSPITAL STANDARDIZATION

The Council has followed with great interest the negot carried on by the Board of Trustees with the American C of Surgeons, the American Hospital Association, and the can College of Physicians leading toward the establishme Joint Commission on Hospital Accreditation to adminis program of hospital standardization which the American C of Surgeons has conducted for more than 30 years. The C believes that the arrangement agreed to by all four organi is a sound one and one that holds great promise for furt proving the quality of hospital care. The Council is looki ward to doing its part to make the new program a successf

SURVEY OF MEDICAL EDUCATION

The survey of medical education which is being conduc the Committee for the Survey of Medical Education un sponsorship of the Council and the Association of An Medical Colleges ended its second year of field work spring of 1951. During the two-year period, 41 school visited.

At the completion of this phase of the study the Com after carefully weighing all aspects of the problem decid it would not be feasible to visit all medical schools as ha planned when the survey was initiated. This decision wa on the recognition that the partial mobilization necessita the Korean conflict had resulted in increasing demands medical schools from other sources and on the recogniti the schools individually and collectively are faced with decisions on a number of fundamental, long term educ polices. It was the opinion of the committee that it could more service to the medical schools and the public by pre an early report of its findings to date than by continu field work for another one or two years. The Committee, fore, decided to discontinue visits to the medical school June 1, 1951, and to address its full energy to the prepara a report by the earliest possible date. It is now hoped th report will be published and ready for distribution by the of 1952.

Early in 1951 the Committee recognized the possibilit it might not be feasible to visit all medical schools. The sc of schools selected for study was, therefore, adjusted to g adequate cross section of the medical schools of the United States. Since the purpose of the survey was to study problems that are basic to all medical schools rather than the peculiar problems of individual schools and since a representative cross section of schools has been studied, it is the committee's belief that the value of its report will not be materially affected by the lack of opportunity to visit all schools.

The Subcommittee on Preprofessional Education, under the chairmanship of Dr. Aura E. Severinghaus of Columbia University, continues to work in coordination with the program of the Survey Committee. During the past year the subcommittee made an intensive study of preprofessional education which included visits to approximately 100 colleges and universities which offer preprofessional training. In November, 1950, this committee sponsored a three day conference at which a group of leaders from the liberal arts colleges met with the Subcommittee on Preprofessional Education and the Survey Committee for the purpose of discussing the principles and problems of preprofessional education. The points of view and opinions expressed in this conference were summarized and utilized by the subcommittee in orienting its study of preprofessional education in the liberal arts colleges.

A larger conference is being planned for the spring of 1952, to which representatives of the liberal arts colleges and medical schools will be invited for the purpose of discussing the final report of the subcommittee.

REVISION OF ESSENTIALS OF AN ACCEPTABLE MEDICAL SCHOOL

Periodically the Council reviews and revises its standards for the various types of educational programs for which it grants approval. During the past year the Council has been engaged in preparing an extensive revision of its "Essentials of an Acceptable Medical School." The last previous revision was made in 1945. At the time this report was prepared some work still remained to be done on the revision. The Council plans, however, to present the revised "Essentials" to the House of Delegates as a supplementary report at either the 1951 Clinical Session or the 1952 Annual Session.

FOREIGN MEDICAL SCHOOLS

Since February, 1950, the Council, in collaboration with the Association of American Medical Colleges, has published a list of foreign medical schools whose graduates it recommends be given consideration on the same basis as graduates of approved medical schools in the United States. The original list of 38 schools has been expanded to 49. The five Swiss schools and the American University of Beirut were added to the list in June, 1950, the University of São Paulo, Brazil, and the four schools in Belgium in February, 1951, bringing the total to 49. It is expected that other schools will be added as rapidly as information accumulates which justifies their inclusion. Since the Council must depend for information largely on reports furnished by qualified American medical educators who have occasion to visit foreign schools under consideration, development of the list must proceed slowly.

This list has now been adopted as a guide by the licensing boards of 23 states and by the National Board of Medical Examiners. Copies of the list are frequently requested by state and federal governmental agencies, universities, other organizations and individuals. The timeliness of the list and the need for it are emphasized by the fact that since Feb. 7, 1950, the Council has received a total of 1,660 requests for information about foreign medical schools.

SECTION ON GRADUATE TRAINING

The Graduate Training Section has been responsible during the past three years for the administration of the Council's internship and residency approval program. Its activities include correspondence with hospitals conducting or planning to conduct intern or resident training, evaluation of new applications for approval of internship and residency programs, the inspection and reinspection of hospitals, correspondence and personal liaison with the specialty boards and medical departments of the federal services and preparation of the lists of approved services for publication in the Internship and Residency Number of The Journal. During the past year this section has cooperated with the National Interassociation Committee on Internships, on which the Council is officially represented, in implementing a new plan for the appointment of interns. This plan is essentially a method by which the student's hospital preference and the hospital's rating of the student are matched through a central office. It has been adopted as the official procedure for making internship appointments for the year 1952-1953.

A detailed statistical report of inspections made by the field staff for the period from Oct. 1, 1950 to Sept. 30, 1951, is presented later in this report. During the past year one member of the Council's staff has devoted his efforts entirely to visiting federal hospitals. This arrangement was considered necessary because of the expansion of the training programs of the federal services and because of the necessity of expediting consideration of applications in Army and Navy hospitals developing new and revised training programs as a result of the present expansion of the military establishment. For the reporting period, the Council's representatives visited 574 hospitals, reviewing and evaluating 238 internship programs and 1,437 residency programs. The Council's long range program of hospital inspections contemplates visiting every hospital approved for internship or residency training at least once every two years. It is anticipated that this program will now be correlated with hospital surveys to be made in connection with the newly established Joint Commission on the Accreditation of hospitals.

For the past several years, the Council has given serious consideration to the problems relating to the supply and distribution of interns. A number of special committees of the House of Delegates have reported their findings after studying the matter and have urged that an attempt be made to correct the abuses resulting from the constantly increasing disparity between the number of internships offered and the number of available interns. Recognizing the seriousness of the present situation, the Council at its June meeting revised its previous policy of approving a hospital for intern training which left the number of internships to be offered entirely to the discretion of the hospital. Following this action, all hospitals approved for intern training were advised that hereafter, approval would be extended annually to include the specific number and type of internships for which the hospital would be approved. This same principle has been in effect for some time in certain specialties for which approval has been granted with a limitation on the number of residents to be appointed. In order to establish a basis for this year, the Council announced a Quota Basis for the Appointment of Interns. Following the announcement, all hospitals approved by the Council were advised of the number of internships for which the hospital would be approved under this program. The large majority of hospitals accepted the necessity of this policy. A number, representing about 15% of those approved, requested increases because of expanded bed capacity or added activities. A few hospitals, as was anticipated, protested the establishment of any sort of quota basis. At the time, lists of approved internships were being prepared for publication in the Internship and Residency Number and in a directory to be used by the National Interassociation Committee on Internships. It became evident that time did not permit a careful consideration of the requests for an increased number of internships from those hospitals which had applied nor to afford an equal opportunity for a review of the status of all other hospitals which might also wish to apply for an increase. In view of these considerations, the Council has presently deferred the quota plan although strongly urging all hospitals to cooperate voluntarily in appointing interns for next year in accordance with this program.

The problems which have resulted from the increasing imbalance between the number of internships being offered in approved hospitals and the number of potential applicants have pointed up the need for a reevaluation of the internship and a reclarification of its present role in the training of a physician. To study these problems and to consider the internship in its broadest aspects, the Council received authorization from the Board of Trustees to appoint an Advisory Committee on Internships. This committee was established in July, 1951, and is composed of leaders from the profession, the major specialty fields, medical education and hospital administration. Its members include: Drs. S. Howard Armstrong, Chicago; Granville Bennett, Chicago; Ulrich Bryner, Salt Lake City; John Leonard, Hartford, Conn.; John McK. Mitchell, Philadelphia; John Paine, Buffalo; John Romano, Rochester, N. Y.; Anthony J. J. Rourke, San Francisco; Robert Wilson, Philadelphia; John Youmans, Nashville, Tenn.; and Victor Johnson, Chairman, Rochester, Minn.

The committee held its first meeting in September, at which time general objectives were reviewed and plans made for the future development of the study. The House of Delegates will be kept informed of the findings and recommendations of the committee.

The Council wishes to point out that a situation comparable to that regarding the supply and distribution of interns is developing in residency training. Hospitals approved by the Council reported last year that 25% of their residency positions were not filled. This is due in part to the fact that many residents have been called to duty with the Armed Forces. It indicates also that applicants for residency positions are now largely limited to physicians completing their internships as contrasted to the postwar period when many medical officers on leaving the service sought residency appointments.

The number of applications for approval of new residency programs received last year numbered 283. While a year ago there were 529 applications on file in the Graduate Training Section on which action was still pending, as of September 30 these had been reduced to 338; of this number the majority have been reviewed by the Council's field representatives and are under consideration by the Council and the specialty boards concerned. The number of hospitals approved for residency training increased from 1,071 in 1950 to 1,120 this year. There has been a definite leveling off, however, in the number of new programs being established, as compared to the period 1946-1950 which saw a two-fold expansion in the number of residencies offered.

Residency programs in general practice increased from 32 in 1950 to 66 this year. A high proportion of these were reported vacant last year, however, which may be accounted for in part by the fact that the programs are newly established. The relation of the general practice residency to intern training in preparing the graduate for a career in family practice is one of the problems which will have the attention of the Advisory Committee on Internships in making its study.

During the past year the Council reviewed all residency programs in orthopedic surgery in collaboration with the American Board of Orthopedic Surgery. On the basis of this survey, hospitals approved for training in this specialty were classified in three groups; those offering full training in orthopedic surgery, including children's orthopedics, adult orthopedics, fractures d the basic sciences as applied to the specialty; those offering these divisions with the exception of children's orthopedic rgery, and a third group which included hospitals which offer training in one or two divisions but do not provide full training qualifying the resident for examination by the Board. Hospitals in this latter category have been encouraged to develop a comprehensive training program either independently or in collaboration with other approved institutions in order to assure the resident of progressively graded, integrated training. The Council in the last revision of its Essentials stressed the desirability of the development of training programs of this type and is collaborating with specialty Boards in other fields to this end.

Since the Council's last report to the House, a survey of state departments of health has been completed by the American Public Health Association. Based on the findings of this survey, the Council, in collaboration with the American Board of Preventive Medicine and Public Health, has approved 12 residency programs in this field. The training is carried out under the supervision of the state health department. In most programs, however, the majority of the residents' time is spent in the local health units. The addition of preventive medicine and public health brings to 28 the number of specialties and subspecialties for which the Council grants approval. In 19 of these, specialty boards have been established. Eighteen boards now collaborate with the Council in the approval of residency programs. The other, the American Board of Ophthalmology, has advised the Council that it does not wish to participate in a residency approval program but that it will accept training in a hospital approved by the Council, in qualifying for its examinations.

Last December, representatives of the American Board of Obstetrics and Gynecology met with the Council to discuss the lack of uniformity in the requirements of the two groups for residency training in this specialty. Following this meeting the Council was advised that the Board had taken action on the points which were discussed with the result that the standards for approval of training programs in obstetrics and gynecology are now essentially the same for both organizations. The wholehearted cooper
ation of this Board, as well as that received from the oth
specialty groups, has been most encouraging to the Council.

The Council has worked in close collaboration during the p
year with the American Board of Internal Medicine and t
American College of Physicians in the evaluation and appro
of residency programs in internal medicine. This work is carri
on by the Conference Committee on Graduate Training in Me
cine, composed of representatives from each of the participati
organizations. The Committee is engaged in a pilot study of re
dency programs in this specialty to lay plans for an overall
view of all approved services in internal medicine. To assist
the work of the committee, the Council received last year
contribution of $1,500 from the American College of Physici
and one of $1,000 from the American Board of Internal Me
cine. The Council has expressed its sincere appreciation
these two organizations for this direct support and interest
elevating standards of training in this specialty. The Cour
further has had the assistance of the Subspecialty Boards of
American Board of Internal Medicine in evaluating and appr
ing residency programs in allergy, cardiovascular diseases, g
troenterology, and pulmonary diseases.

In general surgery, residencies are approved by the Coun
the American Board of Surgery and the American College
Surgeons through the Conference Committee on Graduate Tra
ing in Surgery. This committee has been responsible during
past year for the development of a uniform set of standards
residencies in general surgery and of a list of hospitals offeri
training in the specialty approved by all three organizations
for the establishment of a single hospital inspection procedu
Members of the Council's field staff now make the basic insp
tion of hospitals applying for approval in surgery. Three ot
specialty boards have expressed their interest in the developm
of a similar arrangement in their particular fields. Prelimin
discussions to this end have been initiated with the Ameri
College of Surgeons and the following specialty Boards: Am
can Board of Obstetrics and Gynecology, American Board
Otolaryngology, and the American Board of Proctology.

ACTIVITIES OF THE SECTION ON HOSPITAL SERVICE AN TECHNICAL SCHOOLS

The Section on Hospital Service and Technical Schools d
primarily with the registration of hospitals and the approva
schools for medical technologists, x-ray technicians, phys
therapists, occupational therapists and medical record librari
These activities, carried out in accordance with stand
adopted by the House of Delegates, involve not only the ev
ation of individual applications but also the maintenance
acceptable lists of hospitals and technical schools as publis
annually in THE JOURNAL. The latest issue of the Hospital N
ber, May 12, 1951, contained the names of 6,430 hospi
registered by the American Medical Association. These ins
tions reported in 1950 a total of 1,456,912 beds, 89,200 bassin
17,023,513 admissions, 2,815,806 births, and an average d
census of 1,242,777. The general hospitals, with 15,830,170
missions, offered the greatest volume of service, yet the psyc
tric institutions alone maintained an average daily census
687,567 which is greater than the combined patient load in
other registered hospitals. This annual survey revealed also
while the government hospitals, as a group, have 71% of
total beds, they receive only 25% of all hospital admissions.

From Oct. 1, 1950, to Sept. 30, 1951, the number of regist
hospitals was reduced from 6,662 to 6,549. In this period
hospitals were closed or failed to supply the information ne
sary for continued registration, whereas 309 were added to
list. Locally the respective county medical societies have
ticipated actively in the evaluation of individual applications
full cooperation has also been received from district counci
and other representatives of state medical associations.

In the technical fields the Council on Medical Education
Hospitals has worked closely with the Council on Phys
Medicine and Rehabilitation and the national organizat
representing the various fields. Here the major problems con
chiefly the growing shortage of technical personnel, the
portance of providing additional training facilities and the n
for further evaluation and inspection of existing schools. Con
uing efforts are being made to increase educational opport
ties and impressive gains have already been made, particul

in the x-ray and laboratory fields. In the last year the Council has communicated with all medical schools calling attention to the need for further facilities for the training of physical therapists and occupational therapists. The response has been encouraging as 17 medical schools, aside from the 18 already engaged in physical therapy training, have expressed their interest in the development of suitable programs. In occupational therapy, where 11 medical schools are already participating in technical training, there is indication that 13 additional medical colleges may wish to organize similar courses. In the field of medical record library science, where the shortage of trained personnel is equally acute, suggestions have been made that courses be established for high school graduates who have not fulfilled the college requirements specified in the present standards. This method may be important, also, in relation to other fields for if an adequate supply of technical personnel cannot be produced under present educational methods, it may become necessary to modify the existing pattern or depend in increasing degree on the development of subsidiary groups of junior technicians.

Assistance offered by the American College of Radiology has resulted in a comprehensive survey of the approved x-ray schools in which the inspection of individual training programs is being carried out by regional councilors of the College. This study is progressing rapidly and to date 246 schools have been visited out of a total of 292. In the laboratory field, the Board of Schools of Medical Technology, working in cooperation with the Council, has recently completed a questionnaire survey of the approved schools, now totaling 475. It is anticipated that this study may later develop into a regular inspection program for the evaluation or reappraisal of individual schools.

The Council is continuing its interest in the promotion and development of general practice sections in hospitals. It has collected information for publication in the Hospital Number of THE JOURNAL showing the facilities and privileges available to qualified general practitioners. This material, which has also been forwarded to the American Academy of General Practice, will be supplemented by further studies in the next Annual Census of Hospitals in the United States.

APPROVED EXAMINING BOARDS IN THE MEDICAL SPECIALTIES

No new Boards have been approved during the past year. There are now nineteen Boards established including eleven in urgery and the surgical specialties, six in medicine and the medical specialties and the two clinical-laboratory specialties, pathology and radiology.

ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE

The forty-seventh annual Congress on Medical Education and Licensure, sponsored by the Council on Medical Education and Hospitals and the Federation of State Licensing Boards was held in Chicago on Feb. 12 and 13, 1951. Among the subjects discussed were the supply of physicians and the medical curriculum in relation to mobilization, the policies of the Selective Service System with respect to medical personnel, the evolution of the medical curriculum, supply of physicians for rural areas, premedical education and the financing of medical education. The 48th annual congress will be held in Chicago on Feb. 11 and 12, 1952.

COLLABORATION WITH OTHER AGENCIES

The fact that numerous organizations and agencies today have an active interest in one or more phases of medical education requires that there be close cooperation among these various groups if sound national efforts are to be made for the advancement of medical education. From its very beginning the Council has recognized the importance of collaborating with other organizations and has sought to work closely with every major group that has displayed a real interest in medical education. As a result, close collaboration with other agencies has become one of the most significant parts of the Council's program in terms of time, energy, and importance.

Particularly beneficial have been the close relations that the Council enjoys through regularly constituted liaison committees with the Association of American Medical Colleges and the Advisory Board for Medical Specialties, and through the more recently established conference committees on graduate training with the American College of Surgeons and the American College of Physicians. Of great importance also have been the many cooperative undertakings with the individual American boards in the specialties and with the medical departments of the Army, Navy, Air Force, Public Health Service, and Veterans Administration on matters pertaining to programs for graduate training.

Conjoint activities with these and other organizations have been varied in nature and have involved members of the Council, the Secretary and members of the staff. These cooperative enterprises have included consultations, participation in conferences, meetings, the work of advisory committees and joint sessions and studies. A partial list contains the names of 65 agencies and organizations with which the Council has collaborated during the year.

MEDICAL SCHOOLS VISITED

During the year Oct. 1, 1950, to Sept. 1, 1951, the following medical schools were visited for consultations, inspection or in connection with the Survey of Medical Education: Creighton University, Howard University, State University of Iowa, University of Louisville, University of Minnesota, University of North Carolina, University of Puerto Rico, University of Rochester, and University of Ottawa.

Representatives of the Council also participated in studies and consultations relative to establishing a state medical college in New Jersey, the development of medical departments of the University of Miami and Yeshiva University and the expansion of the West Virginia University School of Medicine to a four-year school.

INSPECTION OF HOSPITALS AND TECHNICAL SCHOOLS

Inspections of hospitals and technical schools made by the Council during the year Oct. 1, 1950, to Sept. 30, 1951, are summarized as follows:

Intern training	92
Residencies and Fellowships	336
Intern training and residencies	146
Registration	19
Technical schools	5
Total	598
Individual residencies and fellowship programs investigated	1,437

SUMMARY OF HOSPITALS AND TECHNICAL SCHOOLS

Figures for approved hospitals and technical schools with changes occurring during the year Oct. 1, 1950, to Sept. 30, 1951 are as follows:

Registration of Hospitals	
Hospitals registered, Oct. 1, 1950	6,662
New institutions registered to Sept. 30, 1951	309
Closed or transferred to unclassified files	422
Hospitals registered Sept. 30, 1951	6,549
Internship Approval	
Hospitals approved for intern training, Oct. 1, 1950	792
Approved to Sept. 30, 1951	73
Removed from approved list	21
Hospitals approved for intern training, Sept. 30, 1951	844
Residency Approval	
Hospitals approved for residency training, Oct. 1, 1950	1,071
Approved to Sept. 30, 1951	66
Removed from approved list	17
Hospitals approved for residency training, Sept. 30, 1951	1,120
Medical Technology Schools	
Approved schools, Oct. 1, 1950	488
Approved during year	37
Removed from approved list	10
Approved schools, Sept. 30, 1951	475
Medical Record Librarian Schools	
Approved schools, Oct. 1, 1950	18
Approved during year	2
Removed from approved list	1
Approved schools, Sept. 30, 1951	19
Occupational Therapy Schools	
Approved schools, Oct. 1, 1950	24
Approved during year	0
Removed from approved list	0
Approved schools, Sept. 30, 1951	24
Physical Therapy Schools	
Approved schools, Oct. 1, 1950	31
Approved during year	1
Removed from approved list	1
Approved schools, Sept. 30, 1951	31
X-Ray Schools	
Approved schools, Oct. 1, 1950	278
Approved during year	18
Removed from approved list	4
Approved schools, Sept. 30, 1951	292

COUNCIL PUBLICATIONS

During the period Oct. 1, 1950, to Sept. 30, 1951, the Council was responsible for preparing material for six numbers of THE JOURNAL:

Postgraduate and Continuation Courses for Physicians	Dec. 9
Hospital Service in the United States	May 12
Medical Licensure Statistics	May 26
Postgraduate and Continuation Courses for Physicians	June 9
Medical Education in the United States	Sept. 8
Internship and Residency Number	Sept. 29

Other regular publications of the Council included: Proceedings of the 1951 Annual Congress on Medical Education and Licensure; Approved Examining Boards in Medical Specialties; Choice of a Medical School; Approved Colleges of Arts and Sciences; Foreign Medical Schools; Reciprocity and Endorsement Policies in Medical Licensure; Requirements of Candidates for Medical Licensure on the Basis of Credentials Obtained in Countries Other than the United States and Canada; Federation Bulletin (for the Federation of State Medical Boards of the United States); *Quarterly Report of Residency Information* Service; and lists of sundry technical schools.

The Council also has reprinted for distribution a number of articles dealing with questions relating to the Council's work and responsibilities and, in addition, has published numerous statements in THE JOURNAL from time to time concerning current problems.

ELECTION OF DR. FRANKLIN MURPHY TO THE COUNCIL

Dr. Franklin D. Murphy, Dean of the University of Kansas School of Medicine, was elected to membership on the Council by the House of Delegates at the annual session in June, 1951. *He succeeds Dr. William S. Middleton, who, because of the* pressure of other heavy responsibilities, requested that he not be considered a candidate to succeed himself. Since his election to the Council, Dr. Murphy has been appointed Chancellor of the University of Kansas.

APPRECIATION

It is once again a pleasure for the Council to express its gratitude to the numerous organizations, institutions, and indi- duals who by their generous assistance have contributed so uch to its program this year. Particularly, thanks are due the fficers, trustees, and members of the House of Delegates of the American Medical Association who have provided material aid, suggestions, and encouragement which have been a large factor in the success of the Council's efforts.

Respectfully submitted,

H. G. WEISKOTTEN, Chairman.
VICTOR JOHNSON.
W. L. PRESSLY.
HARVEY B. STONE.
GUY A. CALDWELL.
RUSSELL L. HADEN.
FRANKLIN D. MURPHY.
DONALD G. ANDERSON, Secretary.

REPORT OF THE COUNCIL ON SCIENTIFIC ASSEMBLY

To the Members of the House of Delegates of the American Medical Association:

Since the Clinical Session in Cleveland, Dec. 5-8, 1950, the Council on Scientific Assembly held meetings on March 13 in Houston, Texas; on June 10 in Atlantic City, N. J.; and on July 30 in Los Angeles. The Chairman of the Council also met informally in Houston on January 30 with Mr. Thomas R. Gardiner, Business Manager of the American Medical Association, and Dr. J. T. Billups, Chairman of the Local Committee on Arrangements for the Houston Clinical Session, in preparation for the regular meetng of the Council held in the same city on March 13. The actions taken at these meetings is summarized in this report. A supplemental report on business transacted at a conference with the Section Secretaries on October 16 in Chicago, and at a meeting of the Council on December 2 in Los Angeles will be presented to the House of Delegates at the Los Angeles Session.

1951 CLINICAL SESSION

Arrangements for the Houston Clinical Session were pra
tically completed by the time the Council met in Houston
March 13. Dr. J. T. Billups, Chairman of the Local Committ
on Arrangements, and an active group of Texas physicians i
cluding the deans of the medical schools of Southwestern U
versity in Dallas, Baylor University in Houston and t
University of Texas Medical Branch in Galveston, had outlin
a program of distinction including color televison and a seri
of outstanding exhibits. Splendid teamwork was shown by
Billups and his Houston committee, and their work in the opini
of the Council on Scientific Assembly was admirable. It w
with great regret, therefore, that the Council found it necessa
on recommendation of the Local Committee on Arrangeme
and the Texas Medical Association, to transfer the meeting
another city. It is to be hoped that the work of Dr. Billups a
his colleagues will serve as a model for a future meeting
the American Medical Association in the Southwest, where
Association has not met for 25 years.

As in 1950, when the Clinical Session was unexpectedly tra
ferred in midsummer from Denver to Cleveland, a similar sit
tion confronted the Council in 1951. Houston was abandon
and Los Angeles was quickly chosen as the convention city.
Walter Scott of Hollywood was appointed Chairman of
Local Committee on Arrangements and he, working rapidly a
efficiently, was able to outline his program at a meeting of
Council held in Atlantic City on June 10. Illness of the Cha
man of the Council prevented him from attending, but t
meeting was ably conducted by the Acting Chairman,
Charles H. Phifer of Chicago. A second meeting of the Coun
was held in Los Angeles on July 30, again with Dr. Phifer
Acting Chairman. With the cooperation of representatives of
Los Angeles County Medical Association, Dr. J. Lafe Lud
of Los Angeles was chosen as Co-Chairman to act with
Scott, and the completed committee and program, includ
color television to be broadcast from the Los Angeles Cou
Hospital, was approved by the Council.

The Council offers the Scientific Program for the Los Ange
Clinical Session as part of its report, with expectation that
meeting will exceed the standard set at previous sessions. Gea
to the local facilities, as must be all programs of clinical sessi
speakers have been chosen from a wider area of the cou
than ever before at a midwinter meeting. The session will
be more national in character than in the past, a trend that
the full approval of the Council. To arrange two programs
clinical sessions in one year has been no simple task but, tha
to loyal members of the American Medical Association in Te
and in California, this problem has been met to the satisfac
of the Council on Scientific Assembly and, it is hoped, to
members of the House of Delegates.

TELEVISION

The Council approved the application received from
Smith, Kline and French Laboratories for permission to tele
at Atlantic City and at Los Angeles in 1951. Dr. Stanley
Reimann, a member of the Council, continued to serve as offi
representative of the Council for the 1951 annual and clin
sessions. No other applications for television were received.
Council approved the program presented at Atlantic City un
the direction of Dr. C. Alexander Hatfield, associate surg
to the Pennsylvania Hospital. The program for the Los Ang
Clinical Session, arranged under the direction of Dr. R. Va
Sloan, Glendale, Calif., president of the Los Angeles Cou
Chapter, California Academy of General Practice, was a
approved.

SECTION ON MILITARY MEDICINE

The Council has appointed the following physicians as offic
for the first meeting of the new Section on *Military Medic*
to be held at the Chicago Annual Session in June, 1952:

Chairman, Dr. Melvin A. Casberg, St. Louis.
Vice Chairman, Dr. Richard A. Kern, Philadelphia.
Secretary, Dr. Sheldon S. Brownton, Washington, D. C.
Delegate, Dr. Russel V. Lee, Palo Alto, Calif.
Alternate Delegate, Dr. Wendell Scott, St. Louis.
Executive Committee, Dr. Melvin A. Casberg, St. Louis;
Russel V. Lee, Palo Alto, Calif; Dr. C. C. Shaw, Washingto
D. C.

Representative to Scientific Exhibit, Dr. William S. Stone, Washington, D. C.

Respectfully submitted,

HENRY R. VIETS, Chairman
STANLEY P. REIMANN
ALPHONSE MCMAHON
CHARLES H. PHIFER
CARL A. LINCKE
MICHAEL E. DEBAKEY
SAMUEL P. NEWMAN
LOUIS H. BAUER
President-Elect
AUSTIN SMITH,
Editor of THE JOURNAL
GEORGE F. LULL,
Secretary.
} Ex officio

REPORT OF THE COUNCIL ON MEDICAL SERVICE

To the Members of the House of Delegates of the American Medical Association:

The Council on Medical Service has continued to collect data concerning medical service programs and to study these programs with a view to determining changes and trends. Much of this work was covered in the Council's progress report to the House of Delegates in June. Only recent developments will be presented here.

VOLUNTARY HEALTH INSURANCE

Continued growth in the number of persons protected by the various health insurance programs is encouraging. During 1950 the enrolment increase continued as evidenced by the September, 1951, revision of "A Survey of Accident and Health Coverage in the United States." Compiled by the Survey Committee of the Health Insurance Council, it includes enrolment figures of Medical Society plans, including Blue Shield, private insurance, Blue Cross plans and other voluntary agencies. Copies were sent last September to members of the House of Delegates, officers of the Association, officers of constituent associations, prepayment plans and others.

On Dec. 31, 1950, the number of persons protected by some form of hospitalization, surgical expense and medical care expense benefit insurance totalled 76,961,000, 54,477,000 and 21,589,000, respectively. The numerical growth for each class of coverage during 1950 was: hospitalization, 10,917,000; surgical expense, 13,334,000; and medical expense, 4,727,000. In other words, during 1950 hospitalization enrolment increased 17% and surgical expense benefit enrolment increased 32%, while the number carrying medical expense benefit insurance increased 28%.

Growth in number of persons insured has been accompanied by improvement in the scope of coverage. The improvements in coverage apply to both medical society plans and other programs. Several plans and companies previously writing only group coverage have entered the field of underwriting individual risks. Conversely, several plans and companies heretofore specializing in underwriting individual risks have expanded their activities to include group underwriting. The availability of voluntary health insurance programs is thus increased. A further improvement is the fact that more and more plans and companies are either raising or eliminating entirely the age limit restrictions that once were so common.

The Council's Committee on Prepayment Hospital and Medical Service is maintaining liaison with the Blue Shield Commission and other trade association groups toward the end that such growth may continue on a sound basis.

The attention of the House of Delegates is invited to the statement on voluntary health insurance adopted by the House of Delegates during the 1950 Clinical Session in Cleveland. The Council on Medical Service has approved an amendment to that statement, which starts on page 55 of the Proceedings of the Cleveland Session, and submits this amendment for your consideration. The amendment is the substitution of a new paragraph four (4) as set forth below with the present paragraphs four (4) and five (5) renumbered five (5) and six (6), respectively. The new suggested paragraph is as follows:

> "The hospital supplying the above mentioned hospital services should present a separate bill for those services. The professional person supplying such above stated medical services should present a separate bill distinct from that of the hospital. Professional services are those in which an opinion, diagnosis, interpretation, or treatment is given by a person licensed to practice medicine and surgery."

The Council is encouraged by the sustained interest in the Seal of Acceptance. This is evidenced by the continuing applications on behalf of medical society plans.

In considering applications from prepayment plans for the right to use the Seal of Acceptance, the Council and its Committee on Prepayment Hospital and Medical Service have relied on the constituent associations and component societies. Care has been exercised in interpreting the adopted standards in the light of good public policy. Added safeguards have been approved by the Council. The Council submits to the House of Delegates the following suggestions concerning its issuance of the Seal of Acceptance to plans sponsored or approved by constituent associations and component societies:

1. Any plan which provides reduced benefits in the event a subscriber is treated by a non-participating physician shall not be considered as eligible to receive the Seal of Acceptance.
2. Any plan which requires in writing that its participating physicians shall not participate in any other program shall not be considered as eligible to receive the Seal of Acceptance.
3. The Seal of Acceptance shall not be available, nor continued, to any plan not providing statistical, financial and enrolment data when requested.
4. The Seal of Acceptance is extended to the plan as a mechanism rather than to the actual policies, certificates, fee schedules, claim forms, and so forth. In other words, the Seal if used, should appear on promotional material and not on the legal contracts issued by the approved agencies.

The Council is considering either undertaking or sponsoring studies for the purpose of analyzing the costs of medical care and the reasons for such costs. With the costs and reasons determined, such information would first be made known to the profession and the various agencies in the health insurance field. This would enable the agencies to offer benefits more consistent with the costs. The next step would be to inform the public through the Public Relations Department of the American Medical Association and other channels so the public, in turn, can be in a position to purchase benefits for the insurable costs of medical care in closer relationship to such costs.

FEDERAL MEDICAL SERVICES

The Committee on Federal Medical Services has sponsored conferences with the Department of Medicine and Surgery of the Veterans Administration. Primarily, these conferences were for the purpose of determining the official attitude of the Veterans Administration with regard to its medical care programs. The Home Town Medical Care program for veterans with service-connected illnesses is administered in three ways. Two of the administrative methods involve either contracts or agreements with constituent associations. These conferences have enabled the Committee and the Council to be of greater service to those constituent associations under agreement or contract. The Committee has participated in other conferences designed to improve the features of some of the Home Town Medical Care programs administered through intermediaries.

In addition to the liaison developed with governmental agencies, the Committee is attempting to develop better working relationships with nongovernmental groups and agencies in studying those fields of federal medical services not handled specifically by other committees.

HOSPITALS AND THE PRACTICE OF MEDICINE

The Report on Hospitals and the Practice of Medicine continues to be a topic of widespread discussion. Although the report is primarily a restatement of already established principles, it is looked on as something new and different by many persons in both the medical and hospital field. Members of the Committee on the Extension of Hospitals and Other Facilities have spoken on the general subject before various groups and have replied to numerous inquiries regarding the report.

Such activities as have taken place in an effort to conform to the principles reiterated in the report have been primarily local and, with few exceptions, are being settled locally. In some areas medical care plans are making efforts to include in their contracts those medical services over which there has been controversy. In at least one area, however, one hospital plan has refused to relinquish these medical services despite the willingness of the medical plan to accept them.

Because of the wide divergence of opinion concerning the report and the various interpretations given to it, the Council has requested the Committee on Extension of Hospitals and Other Facilities to meet prior to the Clinical Session and review developments to date.

PHYSICIANS PLACEMENT SERVICE

Interest in improved physician distribution and renewed emphasis on general practice have focused attention on the activities of physician placement services. Virtually all of the state medical associations have some provision to assist physicians who are seeking a location and communities seeking a physician. However, less than one-half of the states have what could be called a formal program. The Council's Physicians Placement Service works closely with state associations, providing a sort of national clearing house for both physicians and communities.

In December, 1950, the Council reported on the situation in a pamphlet, "Physicians Placement Service." In June, 1951, at the request of the Board of Trustees, the Council submitted a report outlining suggestions for an expanded program in the placement field. The statement of the Board to the House of delegates, approved in June, 1951, in regard to this report reads in part as follows:

> "The Board of Trustees believes that there is a definite need for expanding the Association's activities in this field and in providing the leadership to develop further the physician placement services in the state medical societies, as follows: (1) the organization and implementation of an effective physician placement service in every state; (2) expansion of the present program of the American Medical Association's Physician Placement Service; (3) conducting a national conference on physician placement if found advisable, and (4) design plans for financial assistance to physicians in setting up a practice.
>
> "The Board will give support to this program by financing it to the degree demonstrated to be necessary."

As a follow-up to the foregoing recommendations a Conference on Physician Placement Service activities was held in Chicago in October. Attending the Conference were representatives of ten state medical associations, the Association of American Medical Colleges, the American Academy of General Practice and sev- al Councils and Bureaus of the American Medical Association. ong the matters discussed were: What should be the relation- between the American Medical Association Physicians ment Service and the state placement services? What should be done to improve placement service activities throughout the country to obtain a better distribution of physicians?; What can be done to get communities to provide inducements which will attract young physicians?, and Is a "revolving fund" from which young physicians may borrow either necessary or feasible?

One of the primary problems confronting physician placement services is the attitude of physicians towards practice in small communities. As the population of the United States has tended to concentrate in the urban areas, so, too, have physicians moved to the cities. Paralleling this movement has been the trend toward specialization. To reverse these trends requires the combined efforts of the medical societies, the medical schools and the people who live in small communities and rural areas.

Many types of experiments and programs are now in operation throughout the United States, and the Council on Medical Service is collecting and preparing data on the activities of medical societies, medical schools and communities directed to attracting young physicians to general practice and to practice in small communities. Among the activities to be studied and evaluated in the light of placement service objectives are medical scholarship and loan programs, general practice preceptorship programs, special courses for general practitioners, rotating internships and residencies in community hospitals, and inducements that can be provided by communities.

The conclusions of the Conference on Physician Placement Service activities and related problems will be considered by the Committee on Extension of Hospitals and Other Facilities in November.

MATERNAL AND CHILD CARE

As reported in June, activities in the field of maternal and child care have centered around the proposals to revive a program similar to the Emergency Maternity and Infant Care Program which operated during World War II. Conferences have been held with representatives of the American Academy of Pediatrics, Ame can Legion, Association of State and Territorial Health Office American Committee on Maternal Welfare, Catholic Hospi Association, American Hospital Association; American Prot tant Hospital Association, and American National Red Cross.

In the summer of 1951 the Department of Defense estimat the armed forces strength for 1952 at 3½ million men (althou recent estimates put the number at four million) of which appro mately one-third will be married. Military personnel and facilit are expected to care for about 70,000 of the 240,000 estimat births to wives of enlisted men. The remaining 170,000 mu then, be cared for in civilian hospitals and by civilian physicia Statistically this presents no problem, but the fact that ma wives follow their husbands to military camps creates a burd in these areas on both hospitals and physicians. Being "away fr home" also depletes the finances of servicemen's wives, creati a further problem for local welfare agencies.

The question of the need for a special program, such as t World War II E. M. I. C., has occupied much of the time of th conferences. With but one exception the groups with which t Council has conferred have encountered no widespread ne which would warrant the creation of a federal program and ha agreed that with proper planning such maternity cases can cared for locally. The only indication as to the existence of widespread "need" comes from a survey made at the request the Children's Bureau by the American National Red Cross t the month of March, 1951. Even this survey, we believe, is i conclusive and merely emphasizes the need for local and in vidual planning rather than a need for federal interventio

Other equally important questions have also been conside during these conferences. How can such need as does exist, p ticularly in and around the large encampments, be best ca for? How can local and individual planning be best carried To what extent should plans be made in the event that a f scale war is encountered? What part can voluntary health ins ance play in any program that might be developed for the depe ents of servicemen?

The answers to these and other questions are still not clear will require the consideration and cooperation of all interes organizations. The Council believes that adequate liaison been established with interested organizations and will conti to confer with them. For the present, however, the conclusi reported to the House of Delegates in June, 1951, remain changed.

INDIGENT CARE

The Council has made a good start on the complex prob of care of the indigent. During the summer a medical stud with a background in public health administration was emplo for a period of six weeks to assist in the actual field surveys local indigent medical care programs. The study is concer with two general groups of people: (1) those on general re programs, including the indigent and medically indigent, (2) those on Public Assistance Programs, including the old pensioners, the dependent children, the blind, and the per nently and totally disabled. The importance of these groups the field of medical service is apparent when one considers during April, 1951, one person was receiving old age and ability benefits for every 11 employed persons, and one per was receiving public assistance benefits for every 13 pers Accurate data as to the number on general relief are not av able, but it is small compared to the ever-increasing numb coming within the provisions of public assistance.

Preliminary field surveys have been completed in the foll ing communities: New Haven, Conn.; Toledo, Ohio; Madis Wis.; Buffalo, Erie County, N. Y.; Monmouth County, N. Newark, N. J.; and Des Moines, Polk County, Iowa.

In addition, three states and five other local areas have b selected for field surveys this winter and spring. The sched calls for completion of the work by April 1, 1952, so tha complete report on "Medical Care for the Indigent" may made to the House of Delegates next June.

LIAISON WITH OTHER ORGANIZATIONS

Liaison with other national organizations either active in interested in medical service programs is most important, a the Council has made every effort to see that such liaison developed. In addition to the organizations mentioned elsewh in this report, contact has been maintained during the year w representatives of the following groups:

American Academy of General Practice
American Academy of Pediatrics
American Association of Medical Clinics
American College of Radiology
American Dental Association
American Legion
American Public Health Association
American Public Welfare Association
American Society of Anesthesiologists
Association of American Medical Colleges
Association of American Physicians and Surgeons
Blue Shield Commission
Brookings Institution
Chamber of Commerce of the United States
College of American Pathologists
Commission on Chronic Illness
Cooperative Health Federation of America
Federation of Employees' Benefit Associations, Inc.
Health Insurance Council
Insurance Economics Society of America
Medical Economics, Inc.
National Association of Clinic Managers
National Association of Medical Dental Bureaus, Inc.
National Health Council
Public Health Service
Research Council for Economic Security
United Mine Workers Welfare and Retirement Fund
Veterans Administration

LOAN KITS

During the year the loan kits on various aspects of medical ervice have been used extensively. Interest has been greatest n group practice, emergency medical call programs and comunity health councils, although many requests are received for an material on temporary disability benefits legislation, inigent care, and grievance committees. All of the loan kits are ept up-to-date by adding new material as it becomes available.

DISTRIBUTION OF MATERIAL

With few exceptions the Council distributes material only n request. During 1951 requests continued to come from phyicians, medical societies, students, schools and libraries. In ddition, an increased number of requests have come from overnment agencies, labor groups, service clubs, and foreign ountries.

In reply to these requests over 165,000 pamphlets and reprints vere distributed during the year. The bulk of the items had to lo with the general subject of health insurance, voluntary and ompulsory. However, interest in information on such subjects s health councils, emergency call plans, grievance committees, nd physicians placement services has shown considerable ncrease.

Special kits of material have been prepared for debate stulents and to meet the needs of students participating in essay ontests sponsored by the woman's auxiliaries, the Association f American Physicians and Surgeons and others.

Respectfully submitted,

James R. McVay, Chairman.
Elmer Hess, Vice-Chairman.
Jesse D. Hamer.
Joseph D. McCarthy.
Thomas A. McGoldrick.
H. B. Mulholland.
John W. Cline.
E. L. Henderson.
David B. Allman.
Mr. Thomas A. Hendricks, Secretary.

REPORT OF THE AMERICAN MEDICAL EDUCATION FOUNDATION

To the Members of the House of Delegates of the American Medical Association:

The American Medical Association in December, 1950, with the authorization of the Board of Trustees, sponsored the establishment of the American Medical Education Foundation as an independent corporation to receive funds for the support of medical education.

The first meeting of the Board of Directors of the American Medical Education Foundation was held Feb. 14, 1951. A constitution and by-laws were adopted and the following Directors and officers were elected: Drs. Elmer L. Henderson, president; Harvey B. Stone, Vice President; Donald G. Anderson, Secretary-Treasurer; Louis H. Bauer; Gunnar Gundersen; Edwin S. Hamilton; Walter B. Martin; George F. Lull; J. J. Moore; H. G. Weiskotten; and Victor Johnson.

In July, 1951, Mr. Russell F. Staudacher was named to the position of Executive Secretary, and offices are maintained in the headquarters building of the American Medical Association in Chicago.

The Board of Directors held two additional meetings, on April 13 and June 12. At the April meeting the Directors voted to channel receipts of the American Medical Education Foundation through the National Fund for Medical Education headed by former President Herbert Hoover. Subsequently, the Foundation contributed $640,682.90, representing receipts of the Foundation to May 31, 1951. This amount provided more than 50% of the initial grants made by the National Fund to the 79 medical schools in July, 1951.

The officers of the Foundation took an active part in the public announcement meeting of the National Fund held May 16 in New York City. On several other occasions Foundation officers have met with National Fund executives for purposes of evaluating progress and correlating future plans.

The Directors also voted at the April meeting to allow contributors to the Foundation to earmark their donations for the benefit of any approved medical school the donor desired. This action proved a stimulus for added donations from the profession.

During the spring contributions to the Foundation were declared income tax exemptible for the year by the Commissioner of Internal Revenue. This ruling provides for 1952 and subsequent years until permanent exemption is granted.

At the June meeting plans were made for a sample direct mail appeal for funds with additional tests planned for October. As of Oct. 1, 1951 the total contributions to the Foundation were $689,244.90. The organized activities in several states indicate that the $1,000,000 goal for 1951 as set by the profession may be reached in the months immediately ahead.

During 1951 the Foundation used most of the mediums available for promoting and telling the story of the need for funds. Of especial help and great value were the contributions of time, space and counsel made by the Editor and staff of The Journal of the American Medical Association. The Journal printed editorials and contributor listings and gave freely of space for institutional advertising. Additionally, all state and county medical society editors gave many editorial columns to promote the ideals of the Foundation. The plea for contributions was also made by use of an advertising message on the mailing machine which imprinted each piece of first class mail leaving the American Medical Association headquarters building. A clip sheet for use by editors, both lay and professional, was developed in order that all news and aims of the Foundation might be disseminated as widely as possible.

The Foundation exhibited at the American Medical Association session in June and plans to do so at the Clinical Session in December. A new exhibit was developed and first used at the annual meeting of the Medical Society of Virginia. The Foundation is prepared to exhibit at state medical society meetings when the opportunity is presented. Letters have been sent periodically to all state medical association presidents and secretaries informing them of the progress by their states in raising funds for the Foundation. Visits were made to several states for the purpose of assisting in the formation of programs tailored to meet specific needs. These visits served to stimulate many states into activation of programs designed to increase the flow of contributions from certain areas. Several informational pamphlets are being prepared for use in telling the purposes and needs of the Foundation.

Appreciation of the efforts of the Foundation was expressed by the members of the Association of American Medical Colleges meeting in annual session late in October, at which the following motion presented by Dr. George Pack Berry, chairman of the Committee on Financial Aid to Medical Education, was adopted:

> "I move that the Deans of the Medical Schools, in assembly at French Lick for their Sixty-Second Annual meeting, unanimously express their sincere appreciation and their enthusiastic thanks to the Trustees and Officers of the American Medical Education Foundation of the American Medical Association for their substantial support of medical education and for helping to focus national attention on the serious financial predicament of the medical schools."

The Foundation Directors feel that with continued, increasing cooperation by everyone interested in maintaining medical education at the present high level, the present gap between funds needed and funds available will be narrowed. It is on this promise of cooperation and activity that the Directors predicate their plans for the year ahead.

APPRECIATION

The Directors of the American Medical Education Foundation wish to thank all those individuals and organizations both lay and professional, who have had a part in writing the first year's history of one of organized medicine's most important projects. The progress made to date would have been impossible without this valued help. Of particular import and deserving of singular recognition is the American Medical Association, its House of Delegates, trustees and officers for their generosity in making available the half million dollars which became the cornerstone of this fledgling philanthropic organization.

Respectfully submitted,

ELMER L. HENDERSON, President.
HARVEY B. STONE, Vice President.
DONALD G. ANDERSON, Secretary-Treasurer.
LOUIS H. BAUER.
GUNNAR GUNDERSEN.
EDWIN S. HAMILTON.
WALTER B. MARTIN.
GEORGE F. LULL.
J. J. MOORE.
H. G. WEISKOTTEN.
VICTOR JOHNSON.
MR. RUSSELL F. STAUDACHER, Executive Secretary.

REPORT OF THE STUDENT AMERICAN MEDICAL ASSOCIATION

To the Members of the House of Delegates of the American Medical Association:

Dec. 27 and 28, 1951, are important dates for the medical profession, organized medicine, medical education and the medical student. At this time the House of Delegates of the Student American Medical Association will meet in its first annual session, the initial meeting in what promises to be a long series of yearly gatherings of medical students from all parts of the nation.

The Student American Medical Association, while only a year old, is the fruition of the dreams and hopes of many persons and groups for the past two decades and even longer. For years there have been efforts to organize medical students into a cohesive group, as the constitution of the new organization clearly states, "to advance the profession of medicine, to contribute to the welfare and education of medical students, to familiarize its members with the purposes and ideals of organized medicine and to prepare its members to meet the social, moral and ethical obligations of the profession of medicine."

The planning of isolated individuals and groups for years was culminated in tangible fashion on Dec. 29, 1950, when representatives of 42 medical schools attended the constitutional convention in Chicago. Many of the remaining 32 medical schools evinced an interest but had no representative student organization from which to select a delegate.

The following officers were elected to guide the organization:

President:
Warren Mullen, University of Michigan Medical School.
Vice President:
Harry Sandberg, University of Illinois College of Medicine.
Treasurer:
David Buchanan, University of South Dakota, School of Medical Sciences.
Executive Council:
William Davenport, University of Arkansas School of Medicine.
Herbert Sperling, Boston University School of Medicine.
John Looper, Medical College of Georgia.
Donald Brugger, Ohio State University School of Medicine.
James Henderson, University of Oregon Medical School.
Charles Wilson Jr., University of Texas School of Medicine.
Howard Christian, Tufts College Medical School.
Delegates to the American Medical Association House of Delegates:
Warren Mullen, University of Michigan Medical School.
Harry Sandberg, University of Illinois College of Medicine.

MEMBERSHIP DRIVE

The fact that the constitutional convention was held in the middle of the school year presented organizational handicaps. Despite this, 41 schools were organized and the chapters in those schools had ratified the constitution by the end of March, 1950. These charter members represent more than 14,000 stude The beginning of the 1951-52 school year presented the offi of the Student American Medical Association with a challe to organize as many chapters as possible by the end of 1951. this end a concentrated organizational membership drive undertaken by the Council at its September meeting. Since drive began, the qualifying steps which will allow them to m bership as constituent chapters have been taken in 20 schools

COOPERATION

Letters were written to every constituent state medical a ciation outlining past progress of the Student American Me Association and inviting the state groups to a role of active c eration and participation with both the national organiza and the local student academic societies. Typical of the resp is the following:

"The Council of the California Medical Association is stro behind the idea of supporting the ideals of the S. A. M. A. has agreed to pay the expenses of one or two representative each chapter to the annual state meeting as well as to pay the penses of one representative from each chapter to the an meeting of the S. A. M. A."

This type of cooperation has been forthcoming from most of state medical associations.

IMPORTANT EVENTS

Two important events served to distinguish the first 12 mo of the Student American Medical Association. Both were of e importance and will serve now and in future years to add stren and virility to this student organization.

JOURNAL

Deserving of immediate attention is the soon-to-be-publi *Journal of the Student American Medical Association.* The issue will appear during the last week of December, 1951, will be mailed to more than 33,000 medical students and int in the nation. Conception of the Journal came in July of after much survey, investigation and deliberation by the off and persons in the publication field. Following a meeting o Publications Committee, a decision was reached to begin p cation January, 1952. A managing editor has been employe the nucleus of the editorial staff for the new publication an first issue is well on the way to becoming a reality.

BENEFITS AND OBJECTIVES

The second important event was the formulation of a s benefits and objectives for the association. These statemen purpose outline for the members and those outside the orga tion the short and long-range objectives of the group. They been widely circulated in order that the organization might per through a definite statement of objectives.

MISCELLANEOUS

Three issues of "News Vox," a four page newsletter of i mation and progress were distributed to more than 1,000 per

The Council of the Student American Medical Associ held two meetings during the year.

Mr. Leo Brown, first executive secretary of the organiza was succeeded in July by Mr. Russell F. Staudacher.

APPRECIATION

The members of the Student American Medical Associ are sincerely indebted to the medical profession for all the and cooperation so freely given during this first year of or zational life. Thanks also are due to those lay persons whose acts and words helped the group over many initiatory rough s Special gratitude is due the American Medical Association f generosity in providing personnel and suitable space for th ministrative operations. THE JOURNAL OF THE AMERICAN MED ASSOCIATION and all of the state medical journals are also commended for active editorial support of the aims and i of this new organization.

The continued cooperation of all members of the medical fession coupled with earnest effort on the part of Student A can Medical Association members will do much to insure a and prosperous life for the organization.

Respectfully submitted,

WARREN MULLEN, President.
HARRY W. SANDBERG, Vice President.
DAVID BUCHANAN, Treasurer.
MR. RUSSELL F. STAUDACHER, Executive Secretar

PARENTERAL ALIMENTATION WITH INVERT SUGAR

Invert sugar was used parenterally in place of glucose during both the first and second world wars.[1] Since it was considered merely a substitute, however, its use was almost entirely abandoned when adequate supplies of glucose again became available.

Present day emphasis on the desirability of maintaining adequate caloric intake in patients unable to eat the requisite amounts, coupled with the limited rate at which glucose is utilized, led to the re-evaluation of invert sugar for use in parenteral alimentation. Weinstein [2] noted that invert sugar could be injected at a rate of 1.5 gm. per kilogram of body weight per hour, without producing diuresis and with the loss of only insigificant amounts of sugar in the urine. In contrast, equal quantities of glucose could be given no faster than 0.78 gm. per kilogram per hour and even at this rate (approximately one-half that at which the invert sugar was given) almost 10 times as much sugar was spilled in the urine. Gram for gram, the caloric values of the two sugars are the same, 10% solutions furnishing approximately 400 calories and 5% solutions 200 calories per liter. But, since the administration of 10% invert sugar solution requires no more time or fluid volume than does 5% glucose solution, patients can be given twice as many calories.

Since invert sugar is composed of equal parts of dextrose (D-glucose) and levulose (D-fructose), the fact that it is utilized twice as rapidly as glucose must be due to metabolic factors inherent in the sugars. Fructose is more readily phosphorylated and more rapidly utilized than is glucose [3] and is known to be a better glycogen former.[4] It has also been shown that, when fructose and glucose are given together, the amount of glucose disappearing from the circulation is greater than when glucose is given alone.[5] It would appear, therefore, that the rapidity with which invert sugar is utilized is probably due to (1) the more rapid utilization rate of the fructose portion; (2) the catalytic influence of the fructose on the glucose portion; or (3) a combination of the two. Further study will, no doubt, give more information on the physiologic basis for the marked difference in utilization rates of the two sugars. On the basis of the clinical and experimental work already done, however, it would appear that the advantages offered by the greater caloric value, without an increase in fluid volume, of invert sugar solutions should prove useful in patients requiring parenteral carbohydrate alimentation.

CIVIL DISASTERS AND CIVIL DEFENSE

For several years, the medical profession has taken an active part in spreading the message of civil defense within its own ranks and to the population generally. Although encouraging progress has been made, the real test of medical civil defense planning will involve a tedious and monotonous continuation of practice sessions and "dry runs."

A vivid setting for such testing has been furnished by a series of recent civil disasters, the most recent of which was the flood in eastern Kansas and western Missouri. The story of the flood was dramatized by thousands of individual tragedies; by homes swept away; by huge accumulations of debris; by stranded and killed livestock; and by inundated bridges and buildings.

The experience was terrifying and extremely costly; yet by comparison with sudden enemy attack it was a Sunday school picnic. What would our profession have done if, with much less warning, we had been confronted with an atomic attack with its hundreds of thousands of burn, blast, shock and radiation casualties, with its utility failures and its food, water and medical supply shortages? Would medical care systematically have been made available? Would our civil defense organization have swung into action in an efficient manner? Would you have known, as an individual, where to report and what your responsibility was? If all of these questions cannot be answered affirmatively, civil defense prepardedness is still a hazy mirage.

Fortunately, in the Kansas and Missouri flood the thousands of bodies swept away by water were those of livestock and not humans. There were no epidemics as a result of the flood. Human casualties were miraculously few. Therefore, although a variety of disaster medical problems were presented, the medical care required was primarily of a preventive nature. This care for the most part consisted of (*a*) immunization, (*b*) segregating communicable diseases, (*c*) prevention of spread of pediculosis, (*d*) supervision of sanitary safeguards, such as water purification, and (*e*) treatment for exposure and colds.

These services were performed satisfactorily despite a number of unforeseen complications. The decrease in water pressure caused by the flood rendered inoperative the sanitary facilities in many doctors' offices and hospitals. Air conditioning was cut off in certain hospitals, resulting in a lack of ventilation. Sanitary safeguards were jeopardized because of a shortage of pure water. Other facilities imperative for maximum medical efficiency, such as lighting, heat, and refrigeration, were in imminent danger of failure.

In supplying disaster and rehabilitative services, almost complete reliance, at least in certain areas, was placed on the armed forces and private enterprise for supplies, personnel, and transportation. This method of operation was bound to raise questions as to the existence of a local civil defense organization and its ability to handle an emergency of this type.

A well-planned civil defense organization had been set up in the stricken areas. Although individual civil defense volunteers and scattered local civil defense units were utilized, the over-all civil defense organization was not called into action. The reason for this lack of civil defense activity was a provision in local civil defense legislation which limited employment of civil defense forces to situa[illegible] resulting from an enemy attack. Since the time of [illegible]e flood, an aroused and civic-minded citizenry has demanded revised legislation and a type of official thinking that will permit integrated disaster planning.

The concept of the meaning of "civil defense" in the minds of legislators and the general public is apparently too closely allied with atomic, biological, and chemical warfare. Actually civil defense means "the preparation for, and the carrying out of, all emergency functions, other than functions for which military forces or other federal agencies are primarily responsible, to prevent, minimize, and repair injury and damage resulting from disasters caused by enemy attack, sabotage, or other hostile actions or by fire, flood, or other causes." The flood, from which areas of Kansas and Missouri are still recovering, is the exact type of peacetime emergency which the definition of civil defense envisions.

Out of a disaster of this type we must learn certain specific lessons and come to a realization that living in the present era requires that organizations and individuals subject themselves to cooperative civil defense planning and practice. Some of the medical lessons would include (*a*) the necessity for stockpiling vital medical supplies by properly constituted civilian authorities; (*b*) the establishment of emergency water purification facilities; (*c*) the establishment of alternative emergency measures for supplying lights, heat, refrigeration, ventilation, etc., in hospitals and other permanent and improvised treatment centers; and (*d*) the formulation an implementation of adequate mutual aid and mobile support agreements.

In addition, it appears advisable to review local enabling legislation and remove any hampering limitation which preclude civil defense authorities from fulfillin their mission as outlined above. Probably as importan as any of the items mentioned is the demonstrated nee for clear-cut lines of authority. There can be no indecision, no vague chain of command, if an atomic bom falls.

If we learn as a profession and as a nation from suc national disasters as the Kansas-Missouri flood, the civi defense lessons which are thus so expensively taught, we may be prepared to cope with the infinitely greater emergency that an all-out war would bring. It is time to realiz that civil defense is not a game or a scheme but, rathe a new and important civic responsibility and a pattern fo national survival.

SUBNUTRITIONAL PHAGOCYTOSIS

Numerous investigators[1] have described an increase resistance to infectious disease due to undernourishmen In order to throw light on the probable mechanism of th subnutritional immunity, Kuna[2] and associates of t Veterans Administration Hospital, Staten Island, N. Y studied the differences between in vivo phagocytosis adequately fed and in partially starved laboratory an mals. The work was done on adult albino rats. Prior starvation each rat had received a plentiful supply Rockland Farm "rat pellets," supplemented by green Phagocytic activity in rats deprived of food for 36 hou was compared with that of well-fed animals.

To make the tests 20 cc. of a standard suspension nonhemolytic Staphylococcus aureus was injected intr peritoneally into each rat. Peritoneal samples were r moved two to four hours later and examined for cellul content and phagocytic activity. The average number leukocytes per cubic millimeter of peritoneal fluid wa practically identical in the two series, i. e., 14,300 p cubic millimeter. Thirty-eight per cent of the leukocyt showed phagocytosis in the starved group, compared wi but 19% in the controls. The average number of phag cyted bacteria was 423 per 100 leukocytes in the starve group and only 129 per 100 leukocytes in the control The starved rats thus showed twice the control percenta of phagocytizing leukocytes, each of which had engulfe on an average three times the control number of bacteri The clinical significance of these observations is not y evident, but the data accumulated suggest the need fo additional studies.

ORGANIZATION SECTION

FEDERAL MEDICAL LEGISLATION

Summary of Important Bills

Following is a brief summary of the more important medical and health legislative activities of the 82nd Congress, first session. All bills and resolutions not enacted into law during the first session could be considered and passed before the adjournment of the second session next year. The numbering of these bills remains the same and will continue consecutively for both sessions.

There were 9,615 legislative measures introduced, of which 179 were of such medical and health significance that they were analyzed and reported in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION and followed by the Washington Office. Some of the legislation approved by the American Medical Association was enacted into law; none of the bills it actively opposed became law. There were no hearings on bills proposing national compulsory health insurance or federal aid to school health programs. Hearings were held on these subjects during the last Congress.

Bills Which Became Law

H. R. 3298, a bill originally introduced by Representative Durham of North Carolina, became Public Law 215 on Oct. 26, 1951. It amends the Federal Food, Drug and Cosmetic Act, defining prescription drugs by statute and requiring manufacturers to use a caution legend on them. It also legalizes telephone prescriptions from licensed practitioners. Pharmacists may refill prescriptions for nondangerous drugs without permission. It does not amend or conflict with the existing laws controlling narcotics. The law becomes effective April 26, 1952, and will be administered by the Food and Drug Administration.

S. 349, introduced by Senator Maybank, of South Carolina, became Public Law 139 on Sept. 1, 1951. This Defense Housing and Community Facilities and Service Act provides, among other things, for the authorization of loans and grants for construction of hospitals in certain areas designated by the President. Although this bill became law, Congress has not yet appropriated money necessary for launching the hospital phase of the program.

S. 1, originally introduced by Senator Johnson of Texas, amending the Selective Service Act and establishing a commission for studying universal military training, became Public Law 51, June 19, 1951. One of the changes which this law brings about is the extension of the period of service required under the doctor draft law from 21 to 24 months.

H. R. 3193, a bill introduced by Representative Rankin of Mississippi, became Public Law 149 on Sept. 21, 1951, after Congress over-rode a presidential veto. The law provides $120 monthly to veterans with non-service-connected disabilities who need the services of a full-time attendant at home. Other bills relating to veterans that became law are S. J. Res. 72, by Senator George of Georgia, which, as Public Law 28, makes veterans of the Korean War eligible for medical, hospital, compensation, and pension benefits to the same extent as veterans of World War II; H. R. 320, stating that psychoses developing in veterans of World War II and of the Korean war within two years following discharge from active service shall be presumed to be service connected; H. R. 3205, providing the same service connected presumption for multiple sclerosis; S. 1864, another bill that became law after Congress over-rode a veto by President Truman, extending for three years the program by which the government furnishes automobiles to certain eligible disabled veterans of World War II and the Korean war.

Progress of Major Health Bills

Several important health bills have passed either the Senate or the House, and these await action by the other body of Congress before becoming law. S. 445, which would provide federal grants to states for local public health units, passed the Senate by unanimous consent March 12, 1951, and was sent to the House. Hearings were held in the House on this bill and on H. R. 274, a companion bill, but the committee took no further action. H. R. 5426, which proposes to rewrite the laws pertaining to the reserve components setting up the Ready Reserve, Standby Reserve, and Retired Reserve, was passed by the House Oct. 15, 1951, and sent to the Senate. These bills are halfway through the legislative process, and their consideration by Congress probably will be continued during the second session.

Several bills likely to be acted on next year have been considered in committees, but none has passed either House of Congress. S. 337, Federal Aid to Medical Education, early in the first session was reported out of the Senate committee unanimously and without hearings. It was returned to the Senate Labor and Public Welfare Committee on Oct. 3, 1951, after the defeat of the first committee amendment. The committee on Oct. 18, 1951, two days prior to adjournment, again reported the bill and placed it on the calendar. H. R. 910, Federal Aid to Nurse Education, was the subject of public hearings by the House Interstate and Foreign Commerce Committee, but no further action has taken place. There is a companion bill in the Senate, but no hearings were held on it.

Of interest to the profession were several amendments to the tax bill: the Jenner amendment, permitting states to disclose names of public assistance recipients passed; the Ives amendment, which was withdrawn, would have permitted tax deduction for certain professional persons for annuity premiums; the Ecton amendment, which was defeated, would have permitted deduction of medical expenses from taxable income. A provision permitting such a deduction for persons over 65, however, was passed.

Special Studies and Investigations

Congress, especially the Senate, has been engaged in investigations and special studies of interest to the medical profession. The Senate Committee on Labor and Public Welfare, after a study made during the first part of the year, published a comprehensive report, "Health Insurance Plans in the United States," under the direction of Dr. Dean Clark. A Senate subcommittee investigated the administrative and professional policies and practices in the Veterans Administration after the discharge, last January, of Dr. Paul B. Magnuson. It made several recommendations for internal reforms, but no bill has yet been introduced to correct any deficiencies found. A special committee of the House has been making a study of the uses of chemical additives in food products to ascertain whether proper safeguards for consumers were being taken.

Pending Legislation to Be Considered Next Year

In addition to the bills mentioned above, on which some action has been taken, other subjects will probably receive attention by Congress next year. These include S. 1245, a bill introduced by Senator Humphrey of Minnesota, and S. 2337, introduced by Senator Lehman of New York, both to establish an emergency maternity and infant care program (EMIC). Several companion bills on this subject are pending in the House. S. 1140 would create a Department of Health with cabinet status, and several companion bills in the House are pending without prior activity during this Congress. S. 1875, a bill providing federal assistance to cooperative and other nonprofit health associations may be considered in the Senate. The subject of federal grants to states and counties for the prevention of chronic diseases (S. 2246) may receive additional consideration next year.

A more detailed report, summarizing federal legislative action on medical and health bills, appears in Bulletin No. 37, Nov. 16, 1951, published by the Washington Office.

FIFTH GENERAL ASSEMBLY OF THE WORLD MEDICAL ASSOCIATION

The Fifth General Assembly of the World Medical Association, which was held in Stockholm, Sweden, Oct. 15-20, 1951, was attended by representatives of 30 nations and 20 national and international organizations. In his opening address, the retiring president, Dr. Elmer L. Henderson of the United States, reviewed the activities of the association, the relationships that have developed with other international bodies, and its accomplishment in spreading international good will. The Swedish minister of the interior brought a message of greeting from His Majesty the King of Sweden, who was the patron of the assembly.

Dr. Dag Knutson of Sweden, the president-elect, was then inaugurated. In his address, Dr. Knutson recognized the increasing interchange of ideas between nations and international bodies. He stated that if the World Medical Association is to attain its high aims, including aiding all men to reach a better state of health, its work in the international field is indispensable.

The World Health Organization, the Committee for the Coordination of International Medical Congresses, and the International Labor Organization all presented greetings. Two new members were admitted, the national medical associations of Haiti and the Republic of South Korea. Delegates from Western Germany, Japan, and Thailand were present for the first time.

One of the important actions of the assembly was to demand revision of one section of the Draft Covenant on Human Rights. In this proposed article there is a statement that each state agrees to provide legislative measures to promote and protect health. The assembly paid tribute to the intent of the covenant and recognized that the highest standards of health should be available to all people. It also recognized that legislation is necessary to carry out certain aspects of the health problem. Nevertheless, the desired aims in some phases may be, and frequently are, accomplished with or without legislation or with legislation limited to certain categories of persons or services. The following statement appears in the resolution adopted by the assembly:

"The World Medical Association, however, is of the opinion that the proposed methods of implementation of the intent of this covenant are incomplete. The state is not the only body that can or should be called upon to provide the necessary service. The attempt to safeguard the rights of the individual has on i in points disregarded not only the rights of the people to termine certain matters for themselves but the right of certain voluntary groups to aid in raising the level of health. No provision is made for seeking the advice of those who are best qualified to implement any program of health, namely, the medical profession." It was decided to make a survey of the existence of certain types of cancer in relation to geographic and other conditions. In its study on hospitals, it was decided to expand it to cover hospital personnel.

Reports were received from the assistant secretaries for Latin America, Europe, Asia, and Australasia. The one exciting most comment was the one from Australasia, which outlined the new health program brought about in Australasia through the cooperation of the Australian Medical Association and the ministry of health of Australia.

In accepting the report of the Committee on Medical Care and Allied Subjects, of which Dr. R. L. Sensenich, U. S. A., is chairman, the assembly urged all national medical associations to press for controlled clinical trials in the country of origin of all new remedies before they are generally released for medical practice.

There was prolonged discussion on the report of the Committee on Medical Education (Dr. J. A. Pridham, England, chairman). The assembly decided to sponsor an International Conference on Medical Education in 1953. This conference will bring together representatives of medical education and practicing physicians from all over the world. Three general topics will be discussed.

1. What is the aim of undergraduate medical education?

2. What should be the requirements for entrance to medical study?

3. What stress should be placed in the curriculum on preventive medicine, social medicine, general clinical medicine, specialization, and psychosomatic medicine? Other international organizations, such as WHO, CCICMS, and UNESCO, will be invited to participate.

A long discussion took place on the report of the Committee on Social Security (Dr. Dag Knutson, Sweden, chairman). In discussing this report, Dr. P. Glorieux of Belgium stated that constructive action must develop from study and research on this problem. The prestige of WMA can be maintained and further developed only by converting thought and speech into action.

It was apparent from the discussion that there was an increasing tendency for government inroads into the practice of medicine and that no one present was in favor of state medicine. While the problem varies somewhat in the various countries and the solution of the problem must also vary, the undercurrent of the discussion and consensus of the speakers is shown by the following statements.

Dr. Cibrie of France stated that voluntary insurance is th system of preference, for it stimulates personal responsibility Dr. Moran of Ireland commented that human rights imply personal responsibility and that the first human responsibility i the right of the individual to work out his own spiritual an material salvation. The Australian report stated that the cance of social regimentation must be avoided at all costs.

Dr. Gregg of Great Britain remarked that the medical profession might help governments to find more profitable fields if it carried on speaking and activity in such matters as housing, nutrition, and labor conditions. If these matters were attended to, he said, there would be less need for medicine and doctoring in the ordinary sense of the terms. Several national association presented resolutions which were adopted calling on the association for action in various fields.

A scientific session was held, and the following papers wer given: "Prophylactic Treatment Against Pulmonary Tubercul sis," by Prof. Arvid Wallgren, Stockholm; "Therapeutic Trea ment in Pulmonary Tuberculosis," by Dr. Kjeld Torning, Cope hagen; and "Cardiovascular Diseases as a Problem of Medic Organization," by Dr. Gunnar Biorck, Malmo, Sweden.

Television of surgical operations was provided every mor ing by E. R. Squibb & Sons.

Athens, Greece, was selected as the site of the Sixth Gener Assembly (1952). Amsterdam, Holland, was chosen for t Seventh General Assembly (1953), and Rome, Italy, for t Eighth General Assembly (1954).

Prof. Georges Krimpas of Greece is the new president-ele New members of the council are Dr. P. Glorieux of Belgiu Dr. E. L. Henderson of the United States, and Dr. L. R. Mall of Australia.

Other events in connection with the meeting were visits t Karolinska and Söder Hospital, the two largest and most mode hospitals in Sweden. Social events included the Annual Dinr of the World Medical Association, tendered by the Swedi Medical Association at the Grand Hotel. At this dinner the Fl of the World Medical Association was presented to the Swedi Medical Association. A soirée at the National Museum pr vided the delegates and their guests with an opportunity to enj the art collection and listen to a concert of Swedish music play by a string ensemble.

One day was devoted to an excursion through Stockhol The delegates and their guests were taken by motor boat und the numerous bridges of Stockholm to the home of the la Prince Eugen at Valdemarsudde. Luncheon was served at t open-air Museum Shansen. After luncheon the excursion co tinued through the magnificent Town Hall and then to Dro ningholm, the summer residence of the late King Gustaf V. T was served, and the day was concluded with a program at t Drottningholm Theatre, in which original scenes, costumes, ar scripts of the 17th century are still used.

From both a social and a business standpoint, this was t most successful general assembly the World Medical Associatio has ever held. The activities are now beginning to take defini form toward the fulfilment of the objectives of the associatio and the delegates returned to their home countries convince of the need to further the work of the association and with hig regard for the hospitality of Swedish physicians.

MEDICAL NEWS

CALIFORNIA

Mobile Physical Therapy Unit.—On October 1 the Northern California Chapter of the Arthritis and Rheumatism Foundation initiated a mobile physical therapy unit for rheumatoid arthritics who reside in San Francisco. The unit operates under the guidance of the foundation's medical and scientific committee and is designed to provide prescribed physical therapy to patients unable to leave their homes. Treatments are administered by a registered therapist who also trains the patients to help themselves. For the present, service will be limited to patients of arthritis clinics which provide social service. All treatments will be on a basic visit charge, adjustable to the ability of the patient to pay. Clinic social service workers will determine the patient's fee classification. Eventually the service may be made available to private patients of physicians specializing in this field. The Mobile Therapy Unit has been made possible by the contributions received in the past; contributions in the future will determine the extent to which the project may be carried on.

CONNECTICUT

Personal.—Ira V. Hiscock, chairman, department of public health, Yale University, New Haven, has been appointed chairman of the Health Information Foundation's Advisory Committee on Community Health Facilities Research, succeeding the late Dr. John B. Pastore.

Funds for Medical Education.—The Connecticut State Medical Society will canvass every member in a campaign for the American Medical Education Foundation. The canvass is under the direction of the society's Committee on Public Relations, Dr. William G. H. Dobbs, Torrington, chairman.

Professional Relations in Medical Care Insurance.—The Council of New England State Medical Societies held a symposium on this subject November 18 in Boston. "Medical Service Insurance Plans Viewed by Practicing Physicians" was discussed by Drs. Charles L. Farrell, Pawtucket, R. I.; Joseph A. Holmes, Waltham, Mass.; and Daniel J. Sullivan, Nashua, N. H. In addition to officials of the Blue Shield Plan, Dr. William H. Horton, New Haven, Conn., managing director of the Connecticut Medical Service, spoke on "The Structure of Fee Tables in Medical Service Insurance." The after-dinner speaker was Dr. Louis H. Bauer, Hempstead, Long Island, N. Y., President-Elect, American Medical Association.

GEORGIA

Symposium on Exfoliative Cytology.—The Medical College of Georgia announces a second symposium on exfoliative cytology, cancer detection and diagnosis, for Dec. 9-11, 9-14, and 9-21. This will be presented under the direction of Dr. Haims E. Nieburgs and staff. In addition to the faculty of the medical college, the following guest lecturers are scheduled: Dr. Leland D. Stoddard, Kansas City, Kans.; Dr. Abraham E. Rakoff, Philadelphia; Dr. Willis E. Brown, Little Rock, Ark.; Col. Joe M. Blumberg, Washington, D. C.; Mrs. Ruth M. Graham, Boston; Dr. Louis M. Hellman, Brooklyn; Joseph K. Cline, Ph.D., Birmingham, Ala.; Dr. W. Kenneth Cuyler, Durham, N. C.; Dr. John E. Dunn Jr., Bethesda, Md.; Dr. Mortimer A. Benioff, San Francisco; Dr. Peter A. Herbut, Philadelphia; Dr. Ira T. Nathanson, Boston; Dr. Paul Wermer, Chicago, and Dr. Ingrid Stergus, Rome, Ga. A concentrated program of teaching on the fundamentals of cancer, cytology, and diagnostic procedures is provided. Adequate facilities are offered for microscopic and laboratory practice. A second week is offered for those who wish to devote their time entirely to the study of the ample material available.

ILLINOIS

Civil Service Examinations.—Physicians, psychiatrists, and tuberculosis control physicians are being offered immediate civil service employment with the state of Illinois through continuous examinations. State residence is not necessary. Candidates do not take a written examination. Positions are offered immediately to those who qualify after an oral test or interview. Application forms may be obtained from the Illinois Civil Service Commission, Armory Building, Springfield, Ill.

Chicago

Personal.—At the International Congress on Allergy held at Zurich in September, Dr. Samuel M. Feinberg was chosen president-elect of the newly formed International Association of Allergology.

Promotions to Full Professors.—The following five members of the University of Chicago Medical School have been named to full professorships: Drs. J. Garrott Allen and Dwight E. Clark (surgery), Leon O. Jacobson and Joseph B. Kirsner (medicine), and F. Howell Wright (pediatrics).

Gradle Eye Section Dedicated.—The new $12,000 Harry S. Gradle eye section of the Mandel Clinic at Michael Reese Hospital was dedicated October 13. Dr. Gradle, who died in May, 1950, had practiced more than 35 years in Chicago. The section will be used to treat Mandel Clinic patients and for physicians to receive training in ophthalmology.

Fenger Lecture.—The 15th Christian Fenger Lecture of the Institute of Medicine of Chicago and the Chicago Pathological Society will be given at 8 p. m. November 23 at the Palmer House by Anton J. Carlson, Ph.D., Frank P. Hixon Distinguished Service Professor of Physiology Emeritus, University of Chicago. He will speak on "Some Medicosocial Problems Created by Modern Medicine."

Annual Meeting of Institute of Medicine.—The annual dinner of the Fellows of the Institute of Medicine of Chicago will be held at the Furniture Club of America December 4. The presidential address will be delivered by Dr. Walter H. Theobald, clinical professor of otolaryngology, University of Illinois College of Medicine, and president of the Chicago Medical Center Commission, on "The Medical Center District—Its Civic Significance."

Blood Bank at Billings Hospital.—The Bernard Brown Blood Bank at Albert Merritt Billings Hospital was dedicated November 11. It will supply whole blood and plasma to physicians and research workers studying cancer at Nathan Goldblatt Cancer Research Hospital and cancer units of the University of Chicago Medical Center. Funds for the bank were raised by employees of Goldblatt Brothers stores. The bank was named for Mr. Brown, who was vice-president of the company before he was killed in an automobile accident last spring.

LOUISIANA

Annual Lectures.—The annual Oncology Lecture of the Louisiana State University School of Medicine will be delivered November 29 at 8:15 p. m. in Charity Hospital Auditorium, New Orleans. Dr. Gustaf E. Lindskog, professor of surgery, Yale University School of Medicine, New Haven, Conn., will speak on "Diagnosis and Treatment of Mediastinal Tumors."

The annual Musser Lecture of Tulane University of Louisiana School of Medicine will be given by Dr. O. H. Perry Pepper, professor of medicine at the University of Pennsylvania, Philadelphia. He will speak at 8 p. m. November 30 in Hutchinson Memorial Auditorium, New Orleans, on "Geriatrics, Past, Present and Future." Preceding the lecture the Musser portrait by Dr. Hugo T. Engelhardt will be unveiled.

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

MARYLAND

Personal.—Dr. Donald F. Proctor, associate professor of otolaryngology at Johns Hopkins University School of Medicine, Baltimore, has been appointed professor of anesthesiology and anesthesiologist-in-charge at Johns Hopkins Hospital.

Committee for the Study of Pelvic Cancer.—This committee, authorized April 23 by the house of delegates of the Medical and Chirurgical Faculty of the State of Maryland, has opened an office in the Medical and Chirurgical Faculty Building, 1211 Cathedral St., Baltimore, to study delay periods in the treatment of pelvic cancer and to attempt to reduce this period of delay when possible through open discussion and education. Meetings will be held the third Thursday of each month from 5 to 6 p. m., when selected cases will be discussed. Officers of the committee, all of Baltimore, are Dr. Richard W. TeLinde, chairman; Dr. J. Mason Hundley Jr., vice-chairman, and Dr. Beverly C. Compton, secretary-treasurer.

MASSACHUSETTS

Evening Lecture Series.—The House Officers' Association of the Boston City Hospital has added the following to its evening lecture series:

Dec. 4, Developmental Diagnosis of Infant Behavior: Its Role in Clinical Pediatrics and Child Psychiatry, Dr. Arnold L. Gesell, New Haven, Conn.

Dec. 11, Cardiovascular Visualization, Dr. Charles T. Dotter, New York.

These programs will be held at 7 p. m. in the New Cheever Amphitheatre of the Dowling Building of Boston City Hospital.

Retina Foundation.—The Retina Foundation, begun in April, 1950, has now been organized as a new basic research unit of the Massachusetts Eye and Ear Infirmary, Boston. The foundation, located at 30 Chambers St., Boston, includes laboratories for biochemistry, electron microscopy, tissue culture, and optics. Dr. Charles L. Schepens is director and Dr. E. A. Balazs associate director. The Retina Foundation has received grants from the U. S. Public Health Service, the American Optical Company, the Kresge Foundation, the G. M. Hyams Fund, Inc., the Vivian B. Allen Foundation, the National Council to Combat Blindness, Inc., the Office of Naval Research, and the Committee of the Permanent Charity Fund, Inc.; it is also supported by donations m interested individuals. The work was supported in its initial ges by the Veterans Administration.

MICHIGAN

Tuberculosis Case Finding at Fairs.—Mobile tuberculosis case-finding units of the Michigan Department of Health, operating at 23 fairs this summer and fall, x-rayed the chests of 53,982 persons and found 1,124 chest abnormalities, including 560 cases of suspected tuberculosis. Where the small x-ray film indicated a chest abnormality, the individual was advised by mail to see his physician for a complete examination and any needed treatment. About half the abnormalities found were due to conditions other than tuberculosis.

MISSOURI

Dr. Casberg Resigns as Dean.—Dr. Melvin A. Casberg, since Aug. 1, 1949, dean of St. Louis University School of Medicine, has resigned, effective July 1, 1952, because of an acute sensitivity to giant ragweed pollen found in the St. Louis area, which will necessitate a change of residence.

Director of Mental Health Foundation.—Dr. Milton E. Kirkpatrick, director of the Institute of Mental Hygiene in New Orleans, has become director of the Greater Kansas City Mental Health Foundation. This is a collaborative project of Kansas City, the Community Chest, and the Greater Kansas City Association of Trusts and Foundations, designed to coordinate all the mental health activities in that area. In conjunction with the Kansas City General Hospital, a 100-bed psychiatric receiving center will be erected for which the mental health foundation will be responsible. The Child Guidance Clinic and the Kansas City Mental Hygiene Society will also come under its direction. The foundation has made an initial grant of $250,000 for the development of services of the program. Public education as well as outpatient clinical services for adults and children will be developed. A training program and research unit for which funds are available, will be organized in the near future.

NEW JERSEY

Public School for Palsied Children.—A public school for 49 cerebral palsied children, who have never attended public school, was opened in Clifton this fall in the Passaic County Elks' Cerebral Palsy Center. The children will receive both schooling and therapeutic training there. Specially constructed chairs and tables are provided. Subjects are those taught in the city's regular public schools. Funds for the school are furnished by Clifton and the state, with Passaic County communities paying a share for each cerebral palsied child sent to the school. The three teachers have no more than ten pupils in the class at one time as instruction is largely on an individual basis.

NEW YORK

Public Meeting on Cancer.—The 14th annual public meeting of Nassau County Committee of the American Cancer Society will be held November 29 at the Garden City Hotel. This yearly event, formerly known as the Cancer Institute, is designed to acquaint community leaders with the over-all picture of the cancer problem. The luncheon meeting will be followed by a panel discussion.

Postgraduate Anesthesiology.—The New York State Society of Anesthesiologists will hold its fifth annual Postgraduate Assembly Dec. 5-8 at the Hotel New Yorker in New York. There will be 10 scientific sessions in panel format. One panel will be presented by residents and fellows in anesthesiology discussing original investigations in which they have participated. Physicians desiring to attend may secure a registration form from the office of the society at 137 W. 11th St., New York.

Appoint Assistant Dean for Postgraduate Education.—Th University of Buffalo has established an assistant deanship fo postgraduate education in its school of medicine. Dr. Milto Terris, who has been appointed to the new post, will supervis the school's postgraduate program in western New York and it courses for physicians in such fields as cancer, heart, and pedi atrics, and in general medicine and surgery. His appointmen follows a grant of $24,500 to the university by the state healt department for expansion of regional postgraduate education fo physicians in Erie, Niagara, Genesee, Wyoming, Cattaragus, an Chautauqua counties. The program provides for the conduct c conferences by university faculty members at hospitals in th area and for the assignment of residents from affiliated hospital in Buffalo to the community hospitals requesting them. Fiv hospitals are now associated in the regional program, Wyomin County Community Hospital in Warsaw, Genesee Memori Hospital in Batavia, Mount St. Mary's Hospital in Niagara Fall Brooks Memorial Hospital in Dunkirk, and Olean Genera Hospital in Olean, and it is planned to extend the service t other hospitals in the area. Dr. Terris has been associate stat health officer in Buffalo and in 1945-1946 taught public healt and preventive medicine in the university.

New York City

Personal.—A testimonial dinner to Dr. Martin G. Vorhaus chief of medical services at the Hospital for Joint Diseases, wa given Oct. 11. Dr. Vorhaus has resigned from the hospital wit which he has been associated for 25 years to become directo of a hospital in Toledo, Ohio. The dinner was given by th trustees, medical advisory board, and the medical staff.

Schoenberg Lecture on Glaucoma.—Dr. Paul A. Chandler Boston, surgeon at the Massachusetts Eye and Ear Infirmary will deliver the fifth annual Mark J. Schoenberg Lecture o Glaucoma at the New York Academy of Medicine December 3 at 8:30 p. m. on "Narrow Angle Glaucoma." This lectureship was established as a memorial to the late Dr. Schoenberg. It is jointly sponsored by the National Society for the Prevention of Blindness and the New York Society for Clinical Ophthalmology.

Society News.—The New York Institute of Clinical Oral Pathology held its 150th monthly conference in Hosack Hall at the New York Academy of Medicine on Oct. 29. Dr. Hans Selye, professor and director of the Institute of Experimental Medicine and Surgery, University of Montreal, spoke on "General-Adaptation-Syndrome (including the actions of corticotropin [ACTH], cortisone, and 'somatrofin' [STH], a hormone from beef pituitary glands)."——Dr. Arthur A. Knapp of the teaching staff of New York Medical College will read a paper entitled "Treatment of Eye Disease by Cure of Oral Foci" at the next monthly conference of the New York Institute of Clinical Oral Pathology, which will be held Monday evening, November 26, at the New York Academy of Medicine, Room 440, at 9 p. m.

NORTH CAROLINA

Dr. Gardner Named to Board of Surgery.—Dr. Clarence E. Gardner Jr., professor of surgery, Duke University School of Medicine, Durham, has been elected to the examining board of the American Board of Surgery for a six-year term. Membership on the board is limited to 13 surgeons in the United States.

Symposium at Raleigh.—At a medical-surgical symposium of the Raleigh Academy of Medicine November 2 discussions were held on endocrine diseases. Visiting speakers were Dr. Joseph C. Aub, Boston; Dr. George Crile Jr., Cleveland; Dr. F. Curtis Dohan, Philadelphia, and Dr. Howard F. Root, Boston.

OHIO

Hospital News.—Two additional wings of the receiving hospital at Toledo State Hospital are under construction. The administration wing, among other parts, contains an insulin ward with a recreation room for patients. The patients' wing will provide room for 50 more patients.

Cincinnati Academy of Medicine Programs.—The Academy of Medicine of Cincinnati published its complete scientific program for the year in the October issue of the *Cincinnati Journal of Medicine.* Programs through January are as follows:

Nov. 27, William Dameshek, Boston, Current Concepts of the Purpuras.
Dec. 4, Alan R. Moritz, Cleveland, Medico-Legal Problems.
Jan. 8, John H. Talbott, Buffalo, Gout.
Jan. 22, Panel discussion on Hypertension, Paul D. White, Boston; Irvine H. Page, Cleveland, and Reginald H. Smithwick, Boston.

TEXAS

Children's Medical Center.—A new $4 million hospital and medical center for crippled children is to be set up in Fort Worth. About $1,250,000 has been given to the W. I. Cook Memorial Trust under an agreement providing for conversion of W. I. Cook Memorial Hospital and funds of the Fort Worth Children's Hospital into a new children's medical center. The center is to be known as the W. I. Cook Memorial Hospital for Children. The unit for treatment of crippled children will be designated the Tom B. Owens Institute for Crippled Children. Conversion of Cook hospital into the children's medical center is expected to be completed by December, 1952. Its present value including endowments exceeds $2 million. The Fort Worth Children's Hospital is valued at about $750,000. Expansion plans call for facilities for 75 to 100 children in the new hospital.

WISCONSIN

Infectious Disease Control Unit.—A new infectious disease control unit sponsored by the Marquette University Medical School has been opened at Milwaukee County Hospital. Dr. Francis D. Murphy, head of the Marquette department of medicine, is director of the new unit, which will provide patients having noncontagious infections with all known drugs for fighting these infections. The unit's purpose is to determine which drugs will be beneficial in infectious disease. The program will have a teaching function for the hospital house staff and residents and will offer a consultation service for doctors at the hospital. An anonymous Milwaukee benefactor donated money for the project.

GENERAL

Borden Award.—Dr. Edwin Bennett Astwood of Tufts College Medical School, Boston, received the 1951 Borden Award at the recent annual dinner of the Association of American Medical Colleges in French Lick, Ind. The award, given for research in production of corticotropin (ACTH), is $1,000 in cash and a gold medal.

Much More Measles.—The U. S. Public Health Service, National Office of Vital Statistics, reports that the number of cases of measles for the week ended November 3 (2,085) is more than 50% greater than that for the same week last year (1,315). More than two-thirds of the cases for the week were reported in the New England, Middle Atlantic, and East North Central states.

North Pacific Surgical Association.—This association held its annual meeting November 16-17 in Vancouver, B. C., under the presidency of Dr. Lee Smith, Vancouver, B. C. Dr. Frederick G. Kergin, associate professor of surgery, University of Toronto, Canada, was the guest speaker and delivered the Founders Lecture, on "An Alternative Treatment for Certain Cases of Carcinoma of the Rectum."

American Academy of Forensic Sciences.—The fourth annual meeting of the American Academy of Forensic Sciences will be held March 6-8, 1952, at the Biltmore Hotel, Atlanta, Ga. Those interested in presenting papers are urged to submit their titles immediately to Dr. Abraham W. Freireich, Program Chairman, 180 Hempstead Avenue, Malverne, N. Y. The complete proceedings of the third meeting of the academy are in the hands of the printer. Orders for the proceedings may be filed with Prof. Ralph F. Turner, Department of Police Administration, Michigan State College, East Lansing, Mich. The price is $8 per copy.

International Pharmacopoeia Published.—The first volume of the first International Pharmacopoeia setting uniform standards for important drugs was published October 30 by the World Health Organization in Geneva. The book, prepared on the recommendation of 79 member states by the World Health Assembly, contains descriptions of 200 important drugs defined by chemical, physical, and biological tests and is expected to bring uniformity in standards for drugs utilized throughout the world. The first volume also contains 43 appendixes containing instructions for establishing purity and strength of drugs. The names of drugs are given in Latin. Their adoption will prevent confusion arising from the use of different names for the same drug. The second volume, now under preparation, will deal with penicillin, streptomycin, and other antibiotics. An expert committee of the World Health Organization is meeting in Geneva under the chairmanship of Dr. Charles H. Hampshire of London to prepare the second volume. The first volume is now available in English and French. A Spanish edition will be published in the near future.

Prentiss Award in Health Education.—The Cleveland Health Museum has selected Sally Lucas Jean, former director, Health Education Division, American Child Health Association, and retired director, Education Service, National Foundation for Infantile Paralysis, as recipient of the museum's eighth Elisabeth S. Prentiss National Award in Health Education. The placque and citation, given annually, was presented October 30 at the 11th annual breakfast meeting of the museum's national advisory council, held in San Francisco. In addition to her work as director of the two national organizations mentioned, between 1910 and 1917 Miss Jean served as school nurse in Baltimore, organized its demonstration school in the department of education, and was a lecturer for the Children's Playground Association, Baltimore. Between 1918 and her retirement from the National Foundation for Infantile Paralysis in 1951, she organized the department of health service, People's Institute, N. Y., directed the Child Health Organization of America, developed a health education program for schools in Panama Canal Zone, served in the Philippines and Virgin Islands, and was supervisor of health education for the U. S. Indian Service.

State and Territorial Health Officers.—General Sessions of the annual conference of the Surgeon General of the Public Health Service and the chief of the Children's Bureau with the State and Territorial Health Officers, State Mental Health Authorities, and State Hospital Survey and Construction Authorities will be held November 26-29 in the Auditorium of the Federal Security Building in Washington, D. C. At the Monday morning program addresses will be given by Oscar Ewing, administrator of the Federal Security Agency, Surgeon General Leonard A. Scheele, and Dr. Martha M. Eliot, chief of the Children's Bureau. Elmer B. Staats, assistant director of the Bureau of the Budget, will speak on "Federal Budgetary Procedures and Their Relation to Operating Programs." Community Heart Programs and Congenital Heart Disease will be discussed Wednesday morning by Drs. T. Duckett Jones, New York, and Willis J. Potts, Chicago, respectively. The Public Health Problem of Defense Impact Areas will be presented by Drs. Joseph W. Mountin, Washington, D. C., Mr. Allen Pond, Dr. Katherine Bain, Washington, D. C., and Miss Mildred Arnold. Dr. J. W. Knutson will speak on "Fluoridation of Water Supplies." The conference dinner is scheduled for Monday night.

Western Surgical Association Meeting.—The annual meeting of this association will be held November 29-December 1 at the Broadmoor Hotel in Colorado Springs, Colorado, under the presidency of Dr. Erwin R. Schmidt, Madison, Wis. Those speaking by invitation include the following:

- Arthur J. Hunnicutt, Oakland, Calif., Total Gastrectomy with Transposition of the Terminal Ileum and Right Colon.
- John Reid Brown and John William Derr, both of Detroit, Arterial Blood Supply of the Human Stomach.
- H. Mason Morfit, Denver, Management of Head and Neck Cancer by the General Surgeon.
- Walter W. Carroll, Chicago, Application of Combined Hemimandibulectomy and Neck Dissection to Oral Carcinoma.
- Richard M. Zollinger and Wells H. Teachnor, both of Columbus, Ohio. The Late Results of Inferior Vena Caval Ligations.
- Mordant E. Peck and Robert F. Grover, both of Denver, Cardiovascular Responses to Acute Portal Vein Ligation.
- Russell R. Klein and Robert A. Scarborough, both of San Francisco, Diagnosis and Treatment of Polyps of the Colon.
- Richard Patton, Columbus, Ohio, Potassium Depletion in Surgical Patients.

At the annual dinner, following a cocktail hour at 6:30 p. m., Robert L. Stearns, LL.D., president of the University of Colorado, Denver, will be the speaker.

Radiological Society to Meet in Chicago.—The Radiological Society of North America will hold its annual meeting at the Palmer House in Chicago, December 2-7. Those speaking by invitation include:

- Edward C. Stafne, D.D.S., Dental Roentgenologic Aspects of Systemic Disease.
- Loyal Davis, Chicago, and Stanton L. Goldstein, Hines, Ill., Diagnosis and Localization of Organic Lesions of the Central Nervous System Using Radioactive Diiodofluorescein.
- Erik Poppe, Oslo, Norway, Bronchography with Water-Soluble Resorbable Contrast Material.
- Sidney C. Werner, Howard Hamilton, and Martha Romanchuk, all of New York, Therapeutic Effects in Hyperthyroidism from Repeated Tracer Doses of Radioiodine.
- J. J. Stevenson, London, Horizontal Body Section Radiography.
- Vern W. Ritter, Philadelphia, Roentgen Doses During Diagnostic Procedures.
- Major Marvin M. Keirns, U. S. Army (M.C.), Denver, Two Unusual Tumors of the Diaphragm.

In addition, there will be a symposium on pediatrics Monday afternoon, in which Dr. William M. Benzing Jr. and Dr. Samuel B. Chapman Jr., both of Kansas City, Mo., will be guest speakers. The Rocky Mountain Radiological Society will present a symposium on gastritis Wednesday afternoon, on which invited speakers are Drs. Frank B. McGlone, Denver; Leonard W. Larson, Bismarck, N. D.; Robert R. Kling, Grand Forks, N. D., and William B. Dublin, Fort Logan, Colo. Five papers will be presented in a symposium on radioactive isotopes Thursday afternoon. Invited speakers include George A. Boyd, M.S., and Drs. Marshall H. Brucer, Oak Ridge, Tenn.; Harry D. Bruner, Chapel Hill, N. C.; Jesse Perkinson, Ph.D., Oak Ridge, Tenn., and Gould A. Andrews, Oak Ridge, Tenn. Dr. Robert S. Stone, professor of radiology at the University of California Medical School, San Francisco, will deliver the Carman Lecture, on "The Concept of a Maximum Permissible Exposure," on Tuesday at 8 p. m. The annual banquet will be held Friday at 7 p. m.

Society Elections.—The Association of Military Surgeons of the United States at its annual convention in Chicago in October elected Major General Harry G. Armstrong, Surgeon General of the Air Force, as president. Rear Admiral Winchell McK. Craig, U. S. N. R., Mayo Clinic, Rochester, Minn., was elected as vice-president. Col. James M. Phalen, retired, Washington, D. C., was reelected secretary and Stuart E. Womeldorph, D.C.L., Washington, D. C., was reelected executive secretary. ——Dr. Frederick C. Cordes, San Francisco was named president-elect of the American Academy of Ophthalmology and Otolaryngology Oct. 18 at the annual session in Chicago. Three vice-presidents also were elected: Drs. Georgiana M. Dvorak Theobald, Oak Park, Ill.; Percy E. Ireland, Toronto, Canada, and John S. McGavic, Bryn Mawr, Pa. Dr. William L. Benedict, Rochester, Minn., was reelected executive secretary-treasurer. Presidents of the academy are elected a year in advance and take office on Jan. 1 following the annual meeting. The incoming president will be Dr. James Milton Robb, Detroit, who assumes the office on January 1, 1952.——Officers of the American Dermatological Association, Inc., for 1951-1952 include Dr. Edward A. Oliver, Chicago, president; Dr. Frederick M. Jacob, Pittsburgh, vice-president; Dr. Louis A. Brunsting, Rochester, Minn., secretary; and Dr. Eugene F. Traub, New York, treasurer.

Prevalence of Poliomyelitis.—According to the National Office of Vital Statistics, the following number of reported cases of poliomyelitis occurred in the United States in the weeks ended as indicated:

CORRECTION

Industrial Medicine and Surgery.—In the paper by John Eric Dalton in The Journal, Oct. 27, 1951, the statement at the top of page 800, to the effect that *Industrial Medicine and Surgery* was combined in 1950 with other journals to form the *Archives of Industrial Hygiene and Occupational Medicine* was incorrect. *Industrial Medicine and Surgery* is still being published. It was *The Journal of Industrial Hygiene and Toxicology* and *Occupational Medicine* which were combined to form the *A. M. A. Archives of Industrial Hygiene and Occupational Medicine.*

MEETINGS

American Medical Association Clinical Session, Los Angeles, Dec. 4-7. Dr. George F. Lull, 535 N. Dearborn St, Chicago 10, Secretary.

American Association of Medical Clinics, *Mayfair Hotel, Los Angeles,* Dec. 3-4. Dr. Edwin P. Jordan, Box 114, Charlottesville, Va., Executive Director.

American Psychoanalytic Association, Waldorf-Astoria Hotel, New York, Dec. 6-9. Dr. LeRoy M. A. Maeder, 1910 Rittenhouse Square, Philadelphia 3. Secretary.

Annual Congress on Industrial Health, William Penn Hotel. Pittsburgh, Jan. 18-19. Dr. Carl M. Peterson, 535 N. Dearborn St., Chicago 10, Secretary.

Association for Research in Nervous and Mental Diseases, Hotel Roosevelt, New York, Dec. 14-15. Dr. Clarence C. Hare, 170 Maple Ave., White Plains, N. Y., Secretary.

Association of State and Territorial Health Officers, Washington, D. C., Nov. 26-30. Dr. John D. Porterfield, 306 Ohio Depts. Bldg., Columbus 15, Ohio, Secretary.

International Medical Assembly of Southwest Txeas, Municipal Auditorium, San Antonio, Jan. 22-24. Dr. John J. Hinchey, P. O. Box 2445, San Antonio 6, Secretary.

Medical Public Relations Conference, Biltmore Hotel, Los Angeles, Dec. 2-3. Mr. Leo E. Brown, 535 N. Dearborn St., Chicago 10, Director.

Puerto Rico Medical Association, Santurce, Dec. 12-16. Dr. Victor J. Montilla, P. O. Box 3866, Santurce, Secretary.

Radiological Society of North America, Chicago, Dec. 3-7. Dr. Donald S. Childs, 713 E. Genesee St., Syracuse 2, N. Y, Secretary.

Southern Surgical Association, The Homestead, Hot Springs, Va., Dec. 4-6. Dr. John C. Burch, 2112 West End Ave., Nashville 5, Tenn. Secretary.

Western Surgical Assocation, Broadmoor Hotel, Colorado Springs, Colo., Nov. 29-Dec. 1. Dr. Michael L. Mason, 154 E. Erie St., Chicago 11, Secretary.

INTERNATIONAL

Australasian Medical Congress, Melbourne Victoria, Australia, Aug. 22-30. Dr. C. H. Dickson, Medical Society Hall, 426 Albert St., East Melbourne, Victoria, Australia, Hon. General Secretary.

Commonwealth and Empire Health and Tuberculosis Conference, Central Hall, London, England, July 8-13. Dr. J. H. Harley Williams, Tavistock House North, Tavistock Sq., London, W.C.1, England, Secretary General.

International College of Surgeons, Madrid, Spain, May 20-24. Dr. Max Thorek, 850 West Irving Park Road, *Chicago, Ill., U. S. A.,* Secretary-General.

International Congress on Mental Health, *Mexico City, Mexico, Dec.* 11-19. Mrs. Grace E. O'Neill, Division of World Affairs, National Association on Menal Health, 1790 Broadway, New York 19, N. Y., U. S. A.

International Congress on Neuropathology, Rome, Italy, Sept. 8-13. Dr. Armando Ferraro, 722 W. 168th St., New York, N. Y., U. S. A., Secretary General.

International Congress of Physical Medicine, London, England, July 14-19. Dr. A. C. Boyle, 45, Lincoln's Inn Fields, London, W.C.2, England Hon. Secretary.

Latin American Congress of Physical Medicine, Panama City, R. P., Feb. 24-29. Dr. Cassius Lopez de Victoria, 176 East 71st St., New York, N. Y., U. S. A., Executive Director.

Neuroradiologic Symposium, Stockholm, Sweden, Sept. 17-20. Docent Ake Lindbom, Symposium Neuroradiologicum, Serafimerlasarettet, Stockholm K., Sweden, Secretary.

Pan American Congress of Ophthalmology, Mexico City, Mexico, Jan. 6-12. Dr. Luis Sanchez Bulnes, Gomez Farias 19, Mexico 4, D.F., Secretary-General.

Pan American Congress of Otorhinolaryngology and Bronchoesophagology, Havana, Cuba, Jan. 20-24.

Pan American Congress of Pediatrics, Montevideo, *Uruguay, Dec 5-8.* Dr. Maria Luisa Saldien de Rodriguez, Avenida 18 de Julio, 1246, Montevideo, Uruguay, General Secretary.

Pan American Medical Women's Alliance, Montevideo, Uruguay, Dec. 2-8. Dr. Elizabeth Mason Hohl, 1234 North Vermont Ave., Los Angeles 27, Calif., U. S. A., President.

EXAMINATIONS AND LICENSURE

BOARDS OF MEDICAL EXAMINERS

Alabama: *Examination.* Montgomery, June 24-26, 1952. Sec., Dr. D. G. Gill, 537 Dexter Ave., Montgomery 4.

Colorado:* *Examination.* Denver, Jan. 9-11. *Final date for filing application* is Dec. 10. Sec., Dr. Samuel H. Brown, 831 Republic Bldg., Denver 2.

Delaware: *Examination.* Dover, Jan. 8-10. *Endorsement.* Dover, Jan. 17. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

Florida:* *Examination.* Jacksonville, Nov. 25-27. Sec., Dr. Homer L. Pearson, 701 DuPont Bldg., Miami.

Guam: The Commission on Licensure *will meet whenever a candidate* appears or submits his credentials. Ex. Sec., Dr. John K. Battenfield, Agana.

Hawaii: *Examination.* Honolulu. Jan. 14-17. Final date for filing application *is Dec. 14. Sec., I. L. Tilden, 1020* Kapiolani *St., Honolulu.*

Idaho: Boise, Jan. 7-9. Sec., Mr. Armand L. Bird, 305 Sun Bldg., Boise.

Indiana: Indianapolis, June 1952. Sec., Dr. Paul R. Tindall, 1138 K of P Bldg., Indianapolis 4.

Iowa:* *Examination.* Des Moines, Dec. 3-5. Sec., Dr. M. A. Royal, 506 Fleming Bldg., Des Moines.

Kansas: Topeka, Dec. 12-13. Sec., Dr. O. W. Davidson, 772 New Brotherhood Bldg., Kansas City.

Kentucky: *Examination.* Louisville, Dec. 11-13. Sec., Dr. Bruce Underwood, 620 S. 3rd St., Louisville

Louisiana: *New Orleans, Dec. 6-8. Sec., Dr. Roy B. Harrison, 1507* Hibernia Bank Bldg., New Orleans.

Maryland: *Examination.* Baltimore, Dec. 11-14. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore.

Massachusetts: *Examination.* Boston, Jan. 15-18. Sec., Dr. Robert C. Cochrane, Room 37 State House, Boston.

Mississippi: *Reciprocity.* Jackson, December. *Examination.* Jackson, June. Asst. Sec., Dr. R. N. *Whitfield, Old Capitol Bldg., Jackson.*

Missouri: *Examination.* Jefferson City, Feb. 19-21. *Reciprocity.* Jefferson City, Feb. 11. Exec. Sec., Mr. John A. Hailey, Box 4, State Capitol Bldg., Jefferson City.

Montana: Helena, April 1. Sec., Dr. S. A. Cooney, 214 Power Block, Helena.

North Carolina: *Endorsement.* Raleigh, Jan. 21. Sec., Dr. Joseph J. Combs, 419 Professional Bldg., Raleigh.

North Dakota: Grand Forks, Jan. 2-5. Sec., Dr. C. J. Glaspel, Grafton.

Oklahoma:* *Examination.* Oklahoma City, June 4-5. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

Oregon:* *Examination.* Portland, Jan. 3-5. *Reciprocity.* Portland, Jan. 11-12. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Bldg., Portland.

*Pennsylvania: Philadelphia, Jan 22-25. Acting Sec., Mrs. M. G. Steiner, 351 Education Bldg., Harrisburg.

Puerto Rico: *Examination.* San Juan, March 4. *Sec., Mr. Luis Cueto* Coll, Box 3717, Santurce.

South Dakota:* *Examination. Sioux Falls,* Jan. 15-16. Ex. Sec., Mr. John C. Foster, 300 First National Bank Bldg., Sioux Falls.

Texas:* *Examination.* Houston, Dec. 3-5. Sec., Dr. M. H. Crabb, 1714 Medical Arts Bldg., Fort Worth.

Virginia: *Examination. Richmond, Dec.* 6-8. Final date for filing application is Nov. 24. Sec., Dr. K. D. Graves, 631 First St., S.W., Roanoke.

West Virginia: *Examination.* Charleston, Jan. 7-9. Sec., Dr. N. H. Dyer, Capitol Bldg., Charleston 5.

Wisconsin:* Madison, Jan. 8-10. Sec., Dr. A. C. Koehler, River Falls.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Alaska: *Examination.* On application. Juneau or other towns in Territory as decided by Board. *Reciprocity.* On application. Sec., Dr. C. Earl Albrecht, Box 1931, Juneau.

Colorado: *Examination.* Denver, Dec. 5-6. Sec., Dr. Esther B. Starks, 1459 Ogden St., Denver.

Minnesota: *Examination.* Minneapolis, Jan. 8-9. Sec., Dr. Raymond N. Bieter, 105 Millard Hall, University of Minnesota, Minneapolis.

New Mexico: *Examination.* Santa Fe, Dec. 16. Sec., Mrs. Marguerite Cantrell, Box 1592, Santa Fe.

Oklahoma: *Examination.* Oklahoma, April 14. Sec., Dr. Clinton Gallaher, 813 Braniff Bldg., Oklahoma City.

Oregon: *Examination.* Portland, Dec. 1. Sec., Dr. *Charles D. Byrne,* State Board of Higher Education, University of Oregon, Eugene.

South Dakota: *Examination.* Vermillion, Dec. 7-8. Sec., Dr. Gregg M. Evans, 310 E. 15th St., Yankton.

Tennessee: *Examination.* Memphis, Dec. 27-28. Sec., Dr. O. W. Hyman, 864 Union Ave., Memphis.

Wisconsin: *Examination.* Milwaukee, Dec. 1. Madison, April 5. Sec., Mr. W. H. Barber, Ripon College, Ripon.

* Basic Science Certificate required.

DEATHS

Worcester, Alfred, Waltham, Mass.; born in Waltham, Mass., June 22, 1855; Harvard Medical School, Boston, 1883; professor of hygiene at his alma mater from 1925 to 1935 when he became professor emeritus; deputy commissioner with the rank of major of the American Red Cross for Switzerland during World War I; past president of the Massachusetts Medical Society and Harvard Medical Alumni Association; member of the Boston Obstetrical Society; decorated Officer of the Order of Leopold II, conferred by King Albert of Belgium; trustee of the Massachusetts Hospital for Consumptives from 1897 to 1901 and founder of the Waltham Training School for Nurses; in 1920 chairman of the Massachusetts Commission on Maternity Benefits; author of "Nurses and Nursing," "Nurses for Our Neighbors," "Care of the Aged, Dying and the Dead," "Hygiene for Freshmen," and "Sex Hygiene: What to Teach and How to Teach It" and others; awarded the doctor of science degree by Tufts in 1931; died August 28, aged 96, of coronary occlusion.

Dixon, Robert Livingston, Caro, Mich.; born in Angola, Ind., May 22, 1877; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1910; served on the faculty of his alma mater; member of the American Medical Association and the American Psychiatric Association; specialist certified by the American Board of Psychiatry and Neurology; formerly secretary of the state board of health; past president of the National Association for the Study of Epilepsy; formerly superintendent of the Michigan Farm Colony for Epileptics at Wahjamega, Michigan Home and Training School at Lapeer, and the Caro State Hospital for Epileptics; member of the hospital commission of the Caro Community Hospital; charter member and honorary member of the Caro Rotary Club, of which he had been president; served as president, vice-president, and director of the State Savings Bank; at one time member of the township library commission; died in the University Hospital, Ann Arbor, September 24, aged 74, of coronary occlusion.

Wentworth, John Alexander, West Hartford, Conn.; born in Portland, Me., April 26, 1888; Harvard Medical School, Boston, 1913; specialist certified by the American Board of Internal Medicine; fellow of the American College of Physicians; member of the American Medical Association and the American Heart Association; served during World War I; consulting physician, Manchester (Conn.) Hospital, Institute of Living and Hartford hospitals in Hartford, New Britain (Conn.) General Hospital, William W. Backus Hospital in Norwich and Windham Community Memorial Hospital in Willimantic; died in Veterans Administration Hospital, Northampton, Mass., September 17, aged 63, of cerebral hemorrhage.

Cook, Robert Jay ⊕ New Haven, Conn.; Johns Hopkins University School of Medicine, Baltimore, 1913; member of the American Academy of Orthopaedic Surgeons; fellow of the American College of Surgeons; served during World War I; for many years associated with Yale University School of Medicine; formerly on the faculty of Harvard Medical School in Boston, where he was on the staff of Children's Hospital; attending orthopedic surgeon at Griffin Hospital in Derby, Grace-New Haven Community Hospital, and the Hospital of St. Raphael; died October 4, aged 64, of metastatic carcinoma of the liver.

Wyman, Hugh Evelyn ⊕ Columbia, S. C.; Medical College of the State of South Carolina, Charleston, 1925; specialist certified by the American Board of Urology; past president of the South Carolina Urological Association; member of the American Urological Association and the International College of Surgeons; visiting urologist to the Veterans Administration Hospital; on the staff of Columbia and Providence hospitals; consultant to the South Carolina State Hospital, Camden (S. C.) Hospital, and the Newberry County Hospital in Newberry; died in Highland, N. J., September 1, aged 50.

Carle, William Ross, Perry, Ohio; Ohio Medical Universit Columbus, 1901; member of the American Medical Associatio past president and vice-president of the Lake County Medi Society; for many years county coroner and mayor of Per served on the village council; died July 11, aged 77, of injur received when his automobile was struck by a train.

Casey, Thomas H., Lebanon, Mo.; University of Tennes Medical Department, Nashville, 1891; on the staffs of St. Joh Hospital in Springfield and the Louise G. Wallace Hospital; many years county physician; died September 27, aged 83, coronary thrombosis.

Cavins, John Henry, Lexington, Ky.; Kentucky University Me cal Department, Louisville, 1903; died recently, aged 85.

Chauvet, Frank ⊕ Chicago; College of Physicians and Surge of Chicago, School of Medicine of the University of Illin 1907; clinical associate professor of medicine, emeritus, at alma mater; served on the staffs of Cook County and Garfi Park Community hospitals; died in Oak Park, October aged 73.

Cleveland, Luella S., San Jose, Calif.; University of Michig Department of Medicine and Surgery, Ann Arbor, 1893; di in Los Gatos, August 26, aged 84, of cerebral hemorrhage.

Cocuzza, Vincent ⊕ New York; Regia Universitá degli Studi Palermo, Facoltà di Medicina e Chirurgia, Italy, 1904; on staff of Columbus Hospital; died July 28, aged 72, of hyp tensive heart disease.

Cole, Russel Erwin ⊕ Muncie, Ind.; Starling Medical Coll Columbus, 1906; specialist certified by the American Bo of Pathology; member of the College of American Patholog and American Society of Clinical Pathologists; affiliated Ball Memorial Hospital; died September 16, aged 72, of cinoma of the liver.

Collins, Aubrey John ⊕ Boston; Tufts College Medical Sch Boston, 1902; member of the city health department for m years; died October 3, aged 76.

Comeau, Wilfrid Joseph ⊕ Bangor, Maine; Harvard Me School, Boston, 1933; specialist certified by the American B of Internal Medicine; certified by the National Board of M cal Examiners; fellow of the American College of Physici president of the Maine Heart Association; served during W War II; on the staff of Eastern Maine General Hospital; sulting cardiologist at the Veterans Administration Cente Togus; died September 6, aged 44, of coronary thrombosis.

Conway, John Joseph, Mount Carmel, Pa.; Jefferson Me College of Philadelphia, 1920; member of the American M cal Association; served during World War I; formerly affili with the Veterans Administration in Pottsville; died in the erans Administration Hospital, Wilkes-Barre, September aged 55, of pneumonia.

Corcoran, Michael Patrick, Philadelphia; University of P sylvania Department of Medicine, Philadelphia, 1910; se on the staffs of the Fitzgerald Mercy Hospital in Darby, Mi cordia Hospital and St. Joseph's Hospital, where he died cently, aged 63, of diabetes mellitus.

Corey, George Boaz, Brooklyn; Howard University Colleg Medicine, Washington, D. C., 1897; died September 28, aged

Crocker, Harvey James, Essex, Mass.; Tufts College Med School, Boston, 1942; member of the American Medical A ciation; served during World War II; school physician physician to the board of health; interned at Beverly Hosp in Beverly; served a residency at the Eastern Maine Gen Hospital in Bangor and at the New England Center Hospital Boston; died September 7, aged 34.

Cummins, Harvey Robert, Beverly Hills, Calif.; Emory U versity School of Medicine, 1934; served during World War died in Los Angeles September 18, aged 43, of coron thrombosis.

⊕ Indicates Fellow of the American Medical Association.

eston, Thomas Edwin, New York; University and Bellevue ospital Medical College, New York, 1911; member of the merican Medical Association; affiliated with St. Vincent and Elizabeth's hospitals; died September 21, aged 65, of gasointestinal hemorrhage.

oehring, William Neeb ⊕ Pittsburgh; University of Pittsburgh hool of Medicine, 1914; formerly inspector for the city bureau infectious diseases; died recently, aged 65, of coronary clusion.

ordon, Lourdes Bernard, Oak Park, Ill.; St. Louis University hool of Medicine, 1931; member of the American Medical ssociation; served during World War II; died October 17, aged 5, of hypertensive heart disease.

ough, Albert Sidney, Los Angeles; College of Physicians and urgeons of Los Angeles, 1915; died September 2, aged 67, of eneral *arteriosclerosis.*

ullberg, Earl Arthur, Osceola, Neb.; Creighton University hool of Medicine, Omaha, 1949; member of the American edical Association; served during World War II; affiliated ith St. Francis Hospital; died in St. Joseph Hospital, Omaha, ly 15, aged 29, of aplastic anemia.

arkoff, Kopland Karl, Norwich, Conn.; University of Veront College of Medicine, Burlington, 1919; member of the merican Medical Association; served during World War I; st president of the New London County Medical Association; the staff of the W. W. Backus Hospital, where he died eptember 9, aged 55, of leukemia.

ason, Lester Ray ⊕ Muncie, Ind.; Indiana University School Medicine, Indianapolis, 1925; member of the Industrial edical Association; past president of the Muncie Academy Medicine; died July 2, aged 62, of carcinoma of the gall-ladder.

iitskas, Theodore Victor Joseph ⊕ Trenton, N. J.; Hahneann Medical College and Hospital of Philadelphia, 1930; rved as school physician of Burlington County; affiliated with cKinley Memorial Hospital; died October 2, aged 45.

akaya, Fusataro, Chicago; University of Illinois College of edicine, Chicago, 1916; affiliated with Peoples' Hospital and merican Hospital, where he died October 21, aged 64, of yocardial infarction.

orthrop, Arthur Kimball Sr., ⊕ Detroit; Michigan College of edicine and Surgery, Detroit, 1896; an Associate Fellow of e *American Medical Association; served on the staffs of Provi*nce Hospital and Mount Carmel Mercy Hospital, where he ed July 26, aged 78, of heart failure.

dden, Edgar Floyd, Portland, Tenn.; University of Nashville edical Department, 1899; formerly mayor; died recently, ged 79, of heart attack.

uattlebaum, James Tindal ⊕ Columbia, S. C.; Medical Colge of the State of South Carolina, Charleston, 1927; specialist rtified by the American Board of Internal Medicine; member the House of Delegates of the American Medical Association 1941; served during World War II; for many years on the ff of Veterans *Administration Facility*; affiliated with Baptist spital and Columbia Hospital, where he died September 5, ed 49, of carcinoma of the lung.

ufman, Herman Moses ⊕ Brooklyn; Creighton University hool of Medicine, Omaha, 1938; served during World War affiliated with Coney Island and Kingston Avenue hospitals; d October 10, aged 39.

vay, Apard, New York; Magyar Királyi Pázmány Petrus dományegyetem Orvosi Fakultasa, Budapest, Hungary, 1910; mber of the American Medical Association; died in Ellenle July 10, aged 66, of myocardial infarction.

ynolds, John Henry, Milwaukee; Fordham University School Medicine, New York, 1916, member of the American Medical sociation; affiliated with Milwaukee Children's Hospital; died Wood July 1, aged 62, of coronary thrombosis.

ch, William Tilton ⊕ Neodesha, Kan.; St. Louis University ool of Medicine, 1932; past president of the Wilson County dical Society; served during World War II; died in Wilson unty Hospital September 15, aged 45.

Roberts, James Bray, Kansas, Ill.; University of Pennsylvania Department of Medicine, Philadelphia, 1902; died in Paris (Ill.) Hospital recently, aged 76, of acute myocardial infarction.

Rose, Homer Dewitt ⊕ Sonora, Calif.; College of Physicians and Surgeons, Los Angeles, 1914; an Associate Fellow of the American Medical Association; county physician; died September 26, aged 69, of coronary occlusion.

Rowe, Leonard Blake ⊕ Natick, Mass.; University of Vermont College of Medicine, Burlington, 1906; served during World War I; affiliated with Leonard Morse Hospital; for many years member of the board of health; died in Massachusetts General Hospital, Boston, September 19, aged 77, of carcinoma of the bladder.

Schofield, Nathan Norris, Marion, S. C.; Medical College of the State of South Carolina, Charleston, 1909; died in McLeod *Infirmary*, Florence, September 24, aged 67.

Shontz, Donald Delmont, Massillon, Ohio; Ohio State University College of Medicine, Columbus, 1925; past president of the Stark County Medical Society; died August 22, aged 54.

Simpson, Eugene Grant, Naperville, Ill.; Rush Medical College, Chicago, 1892; affiliated with Copley and St. Charles hospitals in Aurora; died recently, aged 85, of heart failure and gastric hemorrhage.

Stevenson, Charles Robert, Ebensburg, Pa.; University of Maryland School of Medicine, Baltimore, 1897; for many years on the staff of Adrian Hospital, Punxsutawney; died September 13, aged 76, of exfoliative dermatitis.

Stewart, Frank, New York; University of Illinois College of Medicine, Chicago, 1922; member of the American Medical Association; retired ship's surgeon with United States Lines; died in St. Vincent's Hospital September 5, aged 58, of cardiovascular disease.

Tastet, David Walker, Washington, D. C.; George Washington University School of Medicine, Washington, D. C., 1907; served in France during World War I; formerly associated with the Veterans Administration; died in Garfield Memorial Hospital September 8, aged 71, of coronary arteriosclerosis.

Thomas, Charles Alfred, Coffeyville, Kan.; Keokuk (Iowa) Medical College, College of Physicians and Surgeons, 1904; member of the American Medical Association; served with the Veterans Administration; died in the Veterans Administration Hospital September 11, aged 74, of lymphatic leukemia.

Timmons, Peter Joseph ⊕ Woodhull, Ill.; Loyola University School of Medicine, Chicago, 1931; served during World War II; on the staffs of Cottage and St. Mary's hospitals in Galesburg; died in Jacksonville September 3, aged 47, of coronary occlusion.

Tomlinson, George Milton, Philadelphia; Jefferson Medical College of Philadelphia, 1908; served on the staffs of Jefferson and Philadelphia General hospitals; died in Temple University Hospital October 2, aged 65, of arteriosclerotic heart disease and diabetes mellitus.

Weis, Joseph D. ⊕ New Orleans; Harvard Medical School, Boston, 1898; formerly professor of tropical and clinical medicine at Tulane University of Louisiana School of Medicine; on the staffs of Touro Infirmary and Charity Hospital; died recently, aged 79, of coronary occlusion and hypertension.

Whan, William T., Youngstown, Ohio; Cleveland Medical College, *Homeopathic*, 1897; died July 6, aged 91, of a fractured right hip and arteriosclerotic cardiovascular disease.

DIED WHILE IN MILITARY SERVICE

Lorinstein, Hyman I., Atlantic City, N. J.; Middlesex University School of Medicine, Waltham, Mass.; 1936; served during World War II; for many years chief resident of Shore Memorial Hospital in Somers Point; major, medical corps, U. S. Army Reserve; called to active duty at the start of the Korean hostilities; died in Valley Forge General Hospital, Phoenixville, Pa., September 4, aged 43, of pulmonary and myocardial infarction.

GOVERNMENT SERVICES

AIR FORCE

Symposium on Physics and Medicine of the Upper Atmosphere.—A four-day symposium on "The Physics and Medicine of the Upper Atmosphere" began Nov. 6 in San Antonio, Texas, sponsored by the Air Force School of Aviation Medicine and the Lovelace Foundation for Medical Education and Research of Albuquerque, N. Mex. The conference was attended by some 300 medical men, researchers, and aircraft engineers, who discussed the peculiar conditions met by aviators in the upper atmosphere. Among the speakers were Wernher von Braun, builder of the German V-2 rocket, who now advises the United States on its rocket program, Major Charles Yeager, test pilot who first broke through the sonic barrier with the XS-1 in 1947, and test pilot William B. Bridgeman, who has flown higher and faster than any other human being. Bridgeman recently climbed in a rocket-powered Douglas Skyrocket, an experimental craft, to more than 72,000 feet, after having dropped from the underside of a B-29 Superfort high over Muroc Dry Lake, California. In descending from this height, he made more than 1,200 miles an hour, which is twice the rate that sound travels at that height. Problems of extreme cold, extreme heat, lack of pressure, lack of oxygen, and cosmic radiation, among others, make the upper air more like a region on the moon than like one on the earth, according to a release from the Air Force School of Aviation Medicine, Randolph Field, Texas. To solve these problems for pilots calls for the combined efforts of scientists in the fields of physics, radiobiology, engineering, and medicine. This was the first time in aviation annals that scientists came together to exchange views and report on the work which they are doing in this field.

The papers and discussions at this meeting will be published in book form by the University of New Mexico Press.

DEPARTMENT OF DEFENSE

Drive for More Nurses and Women Specialists.—The Defense Department opened a nation-wide drive to recruit an additional 72,000 women for the armed forces, on Armistice Day, November 11. The Army's drive for more nurses is being conducted on the basis of a regional quota system set up and administered by state affiliates of the American Nurses' Association to ensure that civilian nursing service is not disrupted as more nurses enter the armed forces. Besides making heavy demands on Army nurses, the 95,000 men wounded in the Korean war have required many more women medical specialists—dietitians, physical therapists, and occupational therapists—in Army hospitals in the United States and overseas. In connection with their effort to add another 500 such specialists to the corps, WMSC officials have urged young women high school graduates to plan their college studies with a view to qualifying for a career in the women's medical specialist field.

Announcing the coordinated recruiting program to have 112,000 American women in uniform by June, the Deputy Secretary of Defense stressed that "equal recognition to WAC, WAVE, Women Marine, WAF, Army Nurse Corps, Air Force Nurse, Navy Nurse Corps, and Women Medical Specialist Corps of the Army and Air Force (dietitians, physical therapists and occupational therapists) will be provided to every extent possible."

The June recruiting goals for women in the armed forces include: Army—22,147; Navy—4,689; Marine Corps—750; and Air Force—43,906. The total number sought comprises 9,000 officers, including those required by Army Nurse Corps and Women's Medical Specialist Corps.

Responsibility for attaining the objectives of the program rests with the Defense Advisory Committee on Women in the Services. This group is made up of 49 women leaders in the fields of education, business, journalism, theater, medicine, civic activities, and many other phases of American life.

PUBLIC HEALTH SERVICE

Defense Against Biological Warfare.—A Sectional Rese Program to aid in defense against biological warfare is b planned by the Microbiological Institute of the National I tutes of Health. The program will operate through the expar of microbiological research and the strengthening of rela between research centers and official health agencies.

Twelve investigators in various parts of the United St including six already cooperating in the Influenza Study gram, have been invited to work with other scientists in vicinity in implementing the program. Associated with of these laboratories will be from 5 to 10 nearby part laboratories located in universities, state health departm hospitals, or research institutions, selected to cover broad of interest in microbiology.

Participating laboratories may request support for thei search activities from the National Institutes of Health. directors of the coordinating laboratories will supply inform to Public Health Service Regional Medical Directors, who make this information available to the health officers of states in their regions. The whole program will be coordi in the National Microbiological Institute.

The Communicable Disease Center of the Public H Service has a program to strengthen epidemiologic and la tory services through state health departments and to trai demiologists by the assignment of medical officers direct certain state health departments and Public Health Service stations. These officers will be on call to investigate outb of disease in any state through the regular procedures o Communicable Disease Center and the state health depart *Their investigations may be supported on request* by such ices as the participating laboratories of the Sectional Res Program are willing and able to provide.

More Courses in Radiological Health Training.—Five c in radiological health training will be given at the Environ Health Center, Public Health Service, 1014 Broadway, cinnati. Three of the courses will be in basic radiological training and will be held during the following periods: Ja Feb. 1; March 10-21; and April 21-May 2. An interm course, which is an extension of the training provided by th course, will be given Feb. 4-15 and again May 5-16. The c are offered as part of training in radiological health begun Public Health Service in 1950. There are no tuition or labo fees, but travel and living expenses must be arranged an for by the individual or his employer.

The two-week basic course covers basic theory of ra and radiation-detecting instruments, the use and maint of instruments for measuring radiation, and preventive me for protection against radiation hazards. The intermediate is designed to train students in the operation, maintenanc repair of radiation-detection devices used in monitoring c sonnel, and monitoring of water, food, and other sample

Professionally trained persons who are primarily con with radiological health problems in their respective are eligible to attend the basic course. Candidates should h degree in medicine, engineering, physical science, or biol science, and have had experience in public health work. I line for applications is six weeks before the course opens.

Candidates for either of the courses should apply by pr ing a letter which briefly outlines their education and e ence. This letter should be accompanied by the appropriate ommendation of the candidate's superior. Health depart personnel should be recommended by the health officer, and sonnel of other organizations should be recommended by division head of the sponsoring organization. Applications sh be addressed to Chief, Radiological Health Training Sec Environmental Health Service, 1014 Broadway, Cincinna

RKEY

amycin Therapy.—Prof. Ekrem Şerif Egeli, of Istanbul
ersity, and his assistant, Dr. Karabet Arman, have pub-
d the results obtained with terramycin in 18 patients with
ous respiratory diseases. Eight adult patients with acute lobar
monia were given an initial dose of 2 gm. of terramycin
ochloride, followed by 1.5 gm. every three hours. The tem-
ture became normal in four of these patients after 24 hours
in four patients after 48 hours; recovery was uneventful.
hild 11 years old with primary atypical pneumonia of 15
' duration was given 1 gm. of terramycin on admission and
eafter 0.5 gm. every five hours. After 24 hours the tempera-
was normal. There was no relapse, and complete recovery
obtained after nine days. In two patients, 26 and 30 years
with bronchopneumonia, the temperature was normal after
ours. The patients recovered and were discharged after five
. A 48-year-old patient, who had a lung abscess of 12 days'
tion, with gram-positive and gram-negative aerobic and
robic bacilli and cocci in the sputum, had been given
000 units of penicillin and 6 gm. of sulfonilamide without
t. After 17 days of terramycin therapy at the hospital clinic
patient's temperature became normal and expectoration
ed. X-ray examination indicated the disappearance of the
ty, and complete recovery was obtained. A man, 52, who had
ellosis, with an agglutination titer of 1/600 and a tempera-
of 102.2 F for 30 days, recovered at the hospital after nine
. He was given 87 gm. of terramycin. A 19-year-old youth
pannyelophthisis, high temperature, and hemorrhagic diathe-
The leukocytes numbered 18,000, erythrocytes, 2,920,000,
mbocytes, 19,000. The bone marrow showed reticular cells
%, white series count 52.5, red series count 32.8, and plasma
1.0. Blood cultures were negative. On the fourth and fifth
of hospitalization the patient received 2,000,000 units of
cillin without effect. Then he was given 4 gm. of terramycin
y for 20 days. The temperature became normal, the blood
rned to normal, and the patient recovered. One patient,
usly ill with typhoid, was given terramycin on the 14th
Vomiting and diarrhea developed, and terramycin therapy
discontinued. Eight days later the patient died. Another
ent with typhoid was given a daily dose of 2 gm. terramycin,
ing on the 15th day. Recovery began on the ninth day,
it cannot be definitely attributed to terramycin therapy. Two
dren, 6 and 8, who had whooping cough, were given terra-
in. In one case the therapy was begun on the 12th day, in
other on the 18th day. Both patients received a daily dose
.5 gm. After 24 hours whooping decreased one-third. One
d recovered after five days, the other after seven days. Ter-
ycin was administered by mouth only. The average daily
given the children was 2 gm.; the average daily dose for
lts was 5 gm. One patient showed intolerance to the drug.

ptomycin Therapy in Pulmonary Tuberculosis.—Dr. Tevfik
ail Gökce, director of the Istanbul-Heybeliada Tuberculosis
atorium, and his associate, Dr. Ihsan Dincer, reported on
lts of streptomycin therapy during 1950. Of the 161 patients,
were women and 65 were men. The daily dose of strepto-
in was 0.5 to 1 gm. In collapse therapy and other interven-
s this dose proved satisfactory, and good results were also
ined when complications followed such interventions.
ugh patients with extensive exudative tuberculosis showed
moderate improvement, there was improvement in the gen-
condition. Most patients with no lowering of temperature
evidence of streptomycin resistance, but in most patients
temperature was lowered and there was general symptomatic
rovement and steady gain of weight. In patients with empyema, parenteral or intrapleural streptomycin therapy had little effect. Good results were obtained with streptomycin as a prophylactic agent in 23 of 25 patients prior to unilateral and bilateral pneumothorax, in 1 patient prior to pneumonolysis, in 1 prior to cavernostomy, in 3 before thoracoplasty, and in 2 patients with pneumoperitoneum. It gave good results also in 8 of 10 patients with elevated temperature resulting from an exudate following pneumothorax, in 6 of 8 patients with long-standing hydrothorax and periodic elevation of temperature, in 4 of 9 patients with pyopneumothorax and exudate as a result of perforation. Marked improvement was noted in 9 of 11 patients with elevation of temperature and exudate following pneumonolysis, in 5 of 6 patients with continuous fever following extrapleural pneumothorax, in 8 of 10 patients with temperature elevation and general deterioration after thoracoplasty, and in 1 patient with cavernostomy. In one patient with recent infiltration and recent cavity, the infiltration regressed but the cavity remained. There was improvement in 12 of 28 patients with pulmonary tuberculosis and extensive exudative lesions and in 15 patients with pulmonary tuberculosis and elevation of temperature during the course of routine sanatorium treatment. Of three patients with pulmonary tuberculosis and hemorrhage, one showed marked improvement, and the others showed no effect. Eight of 10 patients with pulmonary tuberculosis complicated by tuberculosis of the larynx showed pronounced improvement and regained their voice, and 2 were partly improved. In one patient with pulmonary tuberculosis complicated by peritonitis the temperature became normal and the peritoneal fluid regressed after a daily dose of 0.25 gm. of streptomycin. In one patient with pulmonary tuberculosis complicated by pericarditis, general symptomatic improvement was noted; the pericardial fluid regressed and became normal. This patient received two injections of 0.50 gm. of streptomycin into the pericardium. In one patient with pulmonary tuberculosis complicated by tuberculosis of the intestines, streptomycin proved ineffective. In one patient with tuberculosis of the vertebrae the abscess regressed, and in one patient with osteitis the fistula closed. Of three patients with pulmonary tuberculosis complicated by meningitis there was temporary marked improvement in one patient followed after three months by relapse and death; the other two patients did not benefit from streptomycin therapy. In one patient, whose temperature regressed as a result of streptomycin therapy, streptomycin resistance later developed and paraaminosalicylic acid was given with good results.

Of the 161 patients with pulmonary tuberculosis and other organic complications, 114 patients derived great benefit from streptomycin therapy. The Heybeliada Sanatorium, situated on an island in the Marmara Sea, has 530 beds and is under the direction of the Ministry of Health and Social Assistance. Four-fifths of the beds are free, and there is a long waiting list.

Dr. Ziya Gun Foundation.—The late Dr. Ziya Gun, for 35 years professor of ophthalmology at Istanbul University, willed 75% of his property to the university. It was decided to establish a trachoma research institute to function in cooperation with the ministry of health and social assistance, which for more than 20 years has been engaged in trachoma control and prevention. The income from real estate properties, investments, and £200,000 in bank deposits is to be spent on trachoma research, aid to eye clinics, undergraduate and postgraduate study in ophthalmology abroad, and a money reward every year to the writer of the best thesis in ophthalmology.

Three-Year-Old Lithopedion.—In this unusual case, a laparotomy for extrauterine pregnancy was performed recently at the Adana maternity hospital on a farm woman with two living children. Three years ago, the patient had a pain in the abdomen, vomited, and fainted. The symptoms subsided, but from time to

MEDICOLEGAL ABSTRACTS

Hospitals for Profit: Liability for Inaction of Special Nurse.—The plaintiff filed a suit for damages alleged to have resulted from the failure of the defendant hospital to install sideboards on a hospital bed after an order had been given therefor by a hospital doctor. The plaintiff applied for an order to set aside a verdict in favor of the hospital which application was heard by the supreme court, trial term, New York County, New York.

It appeared that the members of the family of the deceased person specifically requested the hospital, through its agents, to install bed sideboards and that both the hospital servants and a special nurse failed to make the installation. The question presented by this application, said the court, was whether or not a hospital is liable for an injury sustained and attributable to its failure to install bed sideboards after an order has been given therefor by a hospital doctor. The installation of bed sideboards is an administrative act of a hospital and the hospital would be without liability only if the failure of performance by a special nurse absolved the hospital absolutely and without further inquiry into any other factor or circumstance. The defendant failed to furnish any authority sustaining the contention that it was the exclusive function of the special nurse to make the installation. Failure of performance and negligent performance must be distinguished. An act tortiously done by a special nurse producing injury would absolve the hospital. Such immunity would arise whether medical care or administrative function is involved. Can it be said in the present state of the law that a failure of performance on the part of a special nurse, in this particular instance, in the administrative area, absolves the hospital if it too failed to act? While, as defendant argues, the tortious act of a special nurse does not create liability on the part of the hospital, it does not follow that her inaction administratively absolves the hospital. The administrative function to supply a proper bed for the patient's occupancy in pursuance of the doctor's orders is, in the first instance, and remains the nondelegable duty of the hospital whose facilities are engaged.

Accordingly, the plaintiff's application to set aside the jury verdict was granted and the case was returned to the trial calendar.—*Pivar v. Manhattan General, Inc., 104 N.Y.S. (2d) 575 (New York, 1951).*

Income Taxes: Kickbacks, as "Ordinary and Necessary" Business Expense.—The Commissioner of Internal Revenue refused to allow the petitioners to deduct the payment of kickbacks to physicians as "ordinary and necessary" business expenses under the income tax law. The action of the Commissioner was upheld by the tax court so the petitioners appealed to the United States court of appeals, fourth circuit.

The petitioners were engaged in the business of grinding, fitting and selling eye glasses and spectacles. They entered into oral contracts with various oculists whereby petitioners agreed to pay the oculists one-third of the retail price of all eye glasses and spectacles purchased by patients sent to them by the oculists. The evidence shows that the oculists did not regularly inform their patients of this rebate arrangement but such a disclosure was made only when it was specificially requested by individual patients. The sole issue in this case, said the court, is whether these rebates paid by taxpayers to the doctors were deductible as "ordinary and necessary" business expenses.

We feel, said the court of appeals, that the answer to this must be in the negative. No deduction should be allowed as "ordinary and necessary" which violates sharply defined public policy. A doctor owes the duty of undivided loyalty to his patient, and a contract which violates this duty is unenforceable and opposed to public policy. One cannot at the same time serve two incompatible masters. The evil we find in these kickbacks, the court continued, is the receipt by the physician of secret profits through dealings with his patients. Surely, the doctor is assuming an utterly inconsistent position when he recommends *an optician without disclosing* that he is being paid for recommendation. This corrupt practice obviously involves, tends to promote, serious evils: (1) the *prescription* of gla when not actually necessary; (2) more *expensive* lenses t really needed; (3) recommendation of *an inferior* optician; artificial increase in the cost of glasses by the inclusion of physician's commission, for which the physician affords no v *to the patient. The bait* of the secret consideration, which payers offered to the doctor, hopelessly divides the trust int of the doctor. At least two states have thought this practic insidious as to pass legislation forbidding it. We hold, concl the court, since these kickbacks corrupt the fiduciary relation between physician and patient and result in a violation of duty of loyalty, they are opposed to public *policy* and, t fore, are not deductible as "ordinary and necessary" bus expenses by these taxpayers.

That these *deductions* are opposed to public policy, the c continued, is further borne out by the standards set by the m cal profession itself. We find among the "Principles of Me Ethics" of the American Medical Association (1943 E the following: "It is unprofessional to accept rebates on scriptions or appliances or perquisites from attendants wh in the care of patients." "When a patient is referred by one p cian to another for consultation or treatment, whether the p cian in charge accompanies the patient or not, it is unethic give or to receive a commission by whatever term it ma called or under any guise or pretext whatsoever." The record opinion of the tax court also show that these kickbacks been condemned by the Medical Society of North Caroli the State in which these taxpayers were chiefly engaged in ness. Accordingly the decision of the tax court against the tioner was affirmed.—*Lilly et al, v. Commissioner of In Revenue, 188 F (2d) 269 (1951).*

MEDICAL MOTION PICTURE

NEW FILM ADDED TO A. M. A. LIBRARY

Introduction to Aphasia: 16 mm., color, sound, showing t minutes. Prepared by the Department of Medicine and Surgery, V Administration, J. M. Nielsen, M.D., Technical Advisor. Prod *1950* by Churchill-Wexler *Film* Productions, Los Angeles. Procur loan (service charge $3) from Committee on Medical Motion *American Medical Association, 535 North Dearborn St., Chicago*

This film is admirably designed to explain a complex in terms understandable by those who are beginning to aphasia. It presents an over-all definition of aphasia and ments this definition by animated diagrams of the neuroa involved and a demonstration of an actual case. It expla the various forms of aphasia, again using the diagrams o cal neuroanatomy and illustrating actual cases typical c type. *Ingenuity and remarkable skill* are exhibited *in* t torial presentation of a very abstract and *difficult* subje function of speech and its understanding, as well as its o manifestations, are grouped together to make a complet of ideas. Most persons believe that a person with aphasia cannot express himself, but few understand the compone of this lack of expression.

In the film, these parts are isolated from one anoth demonstrated as parts, each of which produces a certa of inability to use words, either in producing or in unde ing them. It is true that lesions of these component p themselves are extremely rare; nevertheless, it is import all those who wish to understand the neurologic defects t what the component parts may be. The conception of a presented in the film is, of course, that of the author accepted by many neurologists, although there might be differences of opinion in detail.

The film is highly recommended for psychologists, n gists, general practitioners, medical students, and speech pists. It will also be of interest to otologists, physical ther occupational therapists, and nurses. This is an outstandi ample of a good medical film production. It is well org into logical sequences, and the photography, animatio narration are excellent.

'ixed Drug Eruption from Aureomycin: Report of Two Cases. A. L. Welsh and L. C. Goldberg.—p. 356.

ıvolvement of the Upper Extremities in Thromboangiitis bliterans.—In typical cases of thromboangiitis obliterans, 40% the patients have arterial disease of the upper extremities in sociation with occlusive arterial disease of the lower extremi-s. It is unusual for the disease to develop in the hands clini-lly before there are symptoms referable to the legs. Farber id McLain recently observed two patients in whom thrombo-ıgiitis obliterans (Buerger's disease) was limited to the upper tremity. In both patients painful ischemic ulcers of the finger ps developed. The lesions became infected and were treated as yoderma until the vascular disease was recognized. A bilateral pper thoracic sympathectomy was done in one. This was fol-ıwed by progressive improvement and healing of the digital lcer. The authors stress that early recognition of this disease a cause of ulceration of the fingers is important, because ırly treatment may prevent the loss of a finger or a limb.

Toxemia During Labor.—This investigation on 500 cases was prompted by the observation that placentas occasionally had a raised, dark area on the maternal surface, typical of the early infarction of acute toxemia, although the patient had been free of toxemia and proteinuria up to admission early in labor. The authors conclude that toxemia is initiated with greater frequency during labor than at any other time during pregnancy. Proteinuria, absent early in labor in 275 consecutive cases, was found to be 1+ at delivery in 41.8% and 2+ to 4+ in 10.7%. Early localized infarction and beginning necrosis were found in 24 placentas. Proteinuria, from 1+ to 4+, developed during labor in 19 of the 24 cases. In five cases, necrosis was recognizable, but had occurred too early to have caused proteinuria. Ten patients showed no proteinuria on admission but showed 2+ to 4+ at delivery. The placentas of all 10 showed early infarction. The characteristic changes in early infarction are enlargement and crowding of the villi, reduction in intervillous spaces and circulation, distention and engorgement of the villous capillaries, and pyknosis and karyorrhexis of the chorionic epithelium. Proteinuria is always present if pyknosis and karyorrhexis are marked, but may be absent if they are slight. Placental infarction apparently has its inception in spasm of the sphincters of the placental veins, obstructing the outflow of fetal blood from the corresponding placental unit. Exposure of uterine muscles of guinea pigs to maternal and fetal blood serum indicated the presence of a spasmogenic or muscle-stimulating factor, presumably capable of inducing contractions of the sphincters in the placental veins. The frequency with which proteinuria and acute placental infarction develop during labor suggests that the initiator of uterine contractions and labor (presumably oxytocin) is also the initiator of spasm of the sphincters of the placental veins, setting up the sequence of events in the placenta that results in toxemia. Since withdrawal of estrogen and progestin has been shown to precede labor as well as toxemia and since estrogen is said to have a depressing or inhibitory effect on the pituitary, release from this effect may possibly account for both the initiation of labor and the greater frequency of toxemia during labor. Toxemia initiated during labor is usually of too short duration to cause clinical symptoms, but, if the toxemia was unrecognized before labor, it may cause late post-partum eclampsia.

ıe Association library lends periodicals to members of the Association ıd to individual subscribers in Continental United States and Canada r a period of five days. Three journals may be borrowed at a time. riodicals are available from 1940 to date. Requests for issues of rlier date cannot be filled. Requests should be accompanied with ımps to cover postage (6 cents if one and 18 cents if three periodicals e requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. eprints as a rule are the property of authors and can be obtained for rmanent possession only from them.

n asterisk (*) before a title indicates that the article is abstracted.

Essential Hypertension with Superimposed Preeclampsia.—Of 244 hypertensive women who were observed at the Providence Lying-In Hospital over the 10 year period 1939-1948, when a total of 51,840 women were delivered, 203 had mild hypertension. There were 73 cases of superimposed preeclampsia in this group of 203, an incidence of 36%. The author discusses such factors as time of onset of preeclampsia, weight gain, separation of placenta, fetal loss, and maternal death. He considers it appropriate to recognize superimposed preeclampsia as an entity in the official classification of toxemia. Although he used the term benign or mild, with regard to hypertension, he feels that the term essential is more appropriate, because the condition is always serious in pregnancy. It is difficult to accept as "benign" any basic physiological complication of pregnancy that entails 14 times the normal expectancy of preeclampsia, 10 times the incidence to toxic separation of the placenta, 20 times the chance of cerebral hemorrhage or convulsive phenomena, one-third the hope of a live birth, and 35 times the normal risk of maternal death.

Chloroquine in Hepatic Amebiasis.—Seven patients with hepatic amebiasis, two of them with an acute amebic liver abscess and two with a chronic amebic liver abscess, were treated with chloroquine diphosphate. Five patients received a primary dose f 1 gm. of the drug for two days, followed by 0.5 gm. daily or two or three weeks, the dose schedule recommended by Conan. The two patients with acute amebic hepatitis were given double this dosage. Results confirmed the effectiveness of chloroquine in hepatic amebiasis. Prompt recovery occurred in four patients. In three patients primary failure of the drug with subsequent success showed the importance of multiple factors in successful therapy and indicated that diagnosis by therapeutic trial with chloroquine may not be feasible, for failure to respond to chloroquine does not rule out amebic hepatic disease. As with emetine, negative therapeutic tests with chloroquine must be interpreted with caution. The dose schedule recommended by Conan seems generally satisfactory. If there is no response, the dose may be increased, as in two of the author's patients, before the drug is considered a failure, and even then, if there is no response, the drug may be observed to act later when other therapeutic procedures, such as drainage, are added. These procedures are at times determinants of the effectiveness of chloroquine, just as they are with emetine. No evidence of serious chloroquine toxicity was observed in the seven patients.

Elevated Serum Pancreatic Enzyme Values.—Appreciable elevations of serum pancreatic enzyme activity were observed in 21 patients without intrinsic pancreatic disease. Only one patient had a serum amylase determination of over 400 mg. per cent, and this was on the 12th day of peritonitis following a ruptured appendix. Of the 21 patients, 6 had elevation of serum amylase activity above 300 mg. per cent. The majority of elevated serum amylase determinations were between 200 and 300 mg. per cent. The highest serum lipase value recorded in the author's cases was 6.2 cc. This was obtained in a patient with pyloroduodenal ulcer with a subacute perforation into the liver. Six patients h
elevated serum lipase values above 4 cc., while the majority
the elevations were between 1.5 cc. and 4 cc. Of the five patien
with perforated peptic ulcers two had elevated serum amyla
and lipase levels within the first 24 hours following the perfor
tion, while in the others elevated serum pancreatic enzym
were determined only after 8 to 10 days. These cases prov
that an elevation of serum pancreatic enzymes may occur
association with an acute perforated peptic ulcer, regardless
the site of the perforation. In the four cases of partial sm
bowel obstruction with elevated serum pancreatic enzymes,
height of the determination was first seen six to eight days f
lowing obstruction. The occurrence of such elevations in as
ciation with partial small bowel obstruction is of diagno
importance in distinguishing between actual mechanical obstr
tion and the ileus that may be associated with acute pancreat
Elevated serum pancreatic enzyme values were observed
several patients with acute peritonitis of almost any etiolo
These elevations were first seen from 5 to 10 days following
insult and were equally reflected in both serum pancre
enzyme values. The values remained elevated for a longer tim
this group than in any of the others. These elevations indica
that some cases of acute peritonitis may be associated with a
gree of pancreatic insult and that this insult is reflected in the
vated serum pancreatic enzyme values for comparatively l
periods even after the patient has become totally asymptoma
The last 3 of the 21 patients had elevations of the serum enzym
in association with renal impairment. In none of the 21 pati
was it possible to correlate the severity or the prognosis of
disease with the time, degree, or duration of elevation of
serum pancreatic enzyme values.

Diuresis in Diabetics Exposed to Stress.—According to Hinkle and associates, there is increasing evidence suggesting that not all of the polyuria that occurs in diabetics can be attributed to an increase in the amount of glucose excreted. In observations on persons with diabetes mellitus of all grades of severity they repeatedly observed an increase in water and glucose excretion, sometimes associated with ketosis and coma, occurring in association with stressful life situations, and not attributable to infection, trauma, or changes in diet, insulin, or activity. A study on "stress diuresis" revealed the following facts: 1. In persons with diabetes mellitus, exposure to stressful life situations may lead to diuresis, which is characterized by a 200-500% increase in the rate of water excretion, accompanied by a rise in the excretion of chlorides and ketone bodies. 2. The stress diuresis occurring in aglycosuric diabetics is similar to that observed in the nondiabetic persons discussed in a previous paper. 3. When stress diuresis occurs in diabetics who are glycosuric, the rate of glucose excretion rises in parallel with the rate of water excretion, and there is no major change in the glucose concentration of the urine. 4. Stress diuresis is not dependent on osmotic changes associated with the excretion of glucose in the urine, or on changes in the concentration of glucose in the blood. 5. A stress diuresis may lead to a rapid loss of large amounts of water, glucose, and chlorides and may be an important factor in the development of acidosis and coma. 6. The ingestion of concentrated glucose solutions is well tolerated by diabetics in the absence of stress, but in stress situations such solutions may increase the loss of water and chlorides.

Serum Concentrations of Chloramphenicol.—Chloramphenicol levels of the serum were determined in 50 patients after the intravenous administration of a new parenteral preparation of chloramphenicol. After a single injection of 1 gm., serum concentrations averaged 20 γ per cubic centimeter at 1 hour, and gradually declined to an average of 2.4 γ per cubic centimeter at 24 hours. After 0.5 gm. was given intravenously, the serum concentrations fell from an average of 10 γ per cubic centimeter at 1 hour to 3.8 γ per cubic centimeter at 12 hours. When levels were compared after oral and intravenous administration, the serum concentrations were slightly higher with the intravenous route at 3 hours, but were twice as high at 12 hours, and persisted for a longer period than with the oral route. From the data obtained, it appears that when chloramphenicol is indicated, and oral administration is not feasible, 1 gm. given every 12 hours intravenously will provide effective therapy. The parenteral preparation was also well tolerated by the intramuscular route but did not give serum levels adequate for the therapy of most infections.

*Temporal Arteritis: Report of Case with ACTH Therapy. W. M. Tate and J. A. Wheeler.—p. 374.

Bone Marrow Biopsy in Metastatic Malignancies.—The possibility of recognizing tumor cells in bone marrow aspirated from the sternum was first studied in 1936 by Rohr and Hegglin, who found tumor cells in 11 of 75 patients with neoplastic disease. Subsequently, some other investigators studied this problem, but there have been few reports in the recent literature. This report is concerned with 11 instances of metastatic malignancy found on sternal bone marrow examinations at the hospital of the School of Medicine of the University of Kansas. Five of these aspirations were done because of unexplained anemia, and two were done because of destructive bone lesions. Four had both an anemia and bone destruction, but the marrow examinations were done primarily for diagnosis of the type of anemia. The malignant lesions diagnosed were as follows: carcinoma of the stomach in three cases, proved carcinoma of the breast in two, probable breast cancer in one, probable carcinoma of prostate or of lung in one each, and melanosarcoma in one. In two others the cancers could not be definitely located. The authors feel that bone marrow biopsy should be done whenever an unexplained anemia occurs in a patient of an age in which malignancy is likely to occur. A marrow biopsy should also be done in all instances in which there are destructive bone lesions and the diagnosis is in doubt. The destructive lesions in the bone in metastatic malignancy, as demonstrated by x-ray, often cannot be differentiated from those of multiple myeloma, and the marrow aspiration biopsy is one of several diagnostic aids. Although the bone marrow findings did not alter the prognosis in any of these cases, they did serve to make the clinical management of the cases more intelligent.

Corticotropin in Temporal Arteritis.—Formerly it was thought that temporal arteritis was a pathological process involving only the temporal vessels; however, most writers now feel that it is much more extensive, since at autopsy the process has been found to involve the retinal, subclavian, renal, carotid, coronary, femoral, occipital, brachial, and cerebral arteries. Tate and Wheeler feel that the term temporal arteritis is a misnomer but will suffice until a better one can be offered. The cause of temporal arteritis is not definitely known. Various treatments have been used, and procaine block of the nerves of the temporal vessels and severing of the vessels have proved most successful. The authors present the detailed history of a patient, who, after inadequate response to several other treatments, was treated with corticotropin (ACTH) in doses of 10 mg. every six hours. The relief was dramatic, but symptoms recurred when the dosage was reduced and subsided again when the original dosage was resumed. Later, however, the dosage could be reduced and for a few days completely interrupted. The total dose of corticotropin was 2,100 mg. The authors say that while cortisone has been used before in temporal arteritis, the case reported here seems to be the first in which corticotropin has been used.

Upper Respiratory Infection and Susceptibility to Poliomyelitis.—This report concerns a sudden outbreak of poliomyelitis that occurred at St. Mark's School in Southboro, Mass., in May 1936. Among 190 boys, poliomyelitis developed in 22 within two weeks. This outbreak is important in several respects: it occurred in the off-season of an off-year; it was sharply localized and was explosive onset with a high attack rate; and it followed a hig incidence of spring respiratory infections than has been su quently observed over a 10-year period. These facts sugges combination of circumstances that favored dissemination of virus and development of clinically manifest disease: a gro ing of susceptibles, as proved by the high attack rate, an relatively sudden and common exposure of five persons thereafter served as reservoirs of infection. Even postulating all 190 boys were infected, the number (13) showing paresi paralysis gives an attack rate some 10 times greater than lifetime rate for the general population—and this withi period of two weeks. Search was made for conditioning fac that may have increased the susceptibility of the group. course of the outbreak shows a time relation to a wave of pital admissions (62) for respiratory infections developin April and the first half of May, 1936. During the period of M through May 20, 41% of boys in whom poliomyelitis developed had upper respiratory infections. The interval bet onset of the two types of illness in 10 boys averaged nine a half days. Five of these 10 exhibited signs of bulbar inv ment. This seems to indicate that upper respiratory infe was one of multiple factors in an outbreak of poliomyelitis c acterized by high frequency of clinical manifestations among total number of boys who could have been infected with virus of poliomyelitis. The authors feel that the hypothesis naturally occurring infections may influence the developm of the clinical manifestations of poliomyelitis is worthy of fu epidemiological and experimental study.

Effects of Corticotropin in Premature Infants.—This report with the systemic rather than the ocular effects of cortico in 19 premature infants with retrolental fibroplasia. The was given in doses varying from 1.7 to 20 mg. per kil of body weight daily for 9 to 27 days. Five infants were second courses of corticotropin. Infants who were given than 5 mg. of corticotropin per kilogram of body weight became hyperirritable and ravenous. Many became palli mediately after the injection of the drug. During treat a severe hand infection caused by Staphylococcus a hemolyticus occurred in one infant and could be controlled antibacterial therapy. The 24-hour urinary output of form hydogenic steroids of untreated premature infants incr directly with increased body weight. Following the admin tion of corticotropin, the 24-hour output of "corticoster increased rapidly and remained pronouncedly elevated during the course of therapy. Retardation of growth occurred during the administration of more than 5 mg. of corticotropin per kilogram of body weight per day. "Rebound" increase in growth took place when administration of corticotropin was stopped. Two infants died after completion of treatment with corticotropin. One death was attributed to pneumonia following fortuitous aspiration of food. The other occurred 24 hours after corticotropin therapy was stopped, on the third day of oral administration of cortisone, and for want of another explanation it must be presumed to be related to the use of these drugs. The death of these two infants emphasizes that when prolonged hyperadrenocorticism has been induced in a premature infant, the latter must be carefully observed for the possibility of a sudden change in his clinical condition.

Polymyxins in Chronic Shigella Infection.—Twenty-three children between 2 and 11 years were selected from three cottages in an institution for mentally defective children in which bacillary dysentery was known to be endemic. The selected children were either asymptomatic carriers of Shigella or were suffering from chronic relapsing infections with S. paradysenteriae (Flexner) with acute symptoms. These patients were placed in isolation wards and were given polymyxin B or E by mouth in daily doses of approximately 15 to 20 mg. per kilogram of body weight for 10 days. The total daily dose was given in three equal portions. Of the 23 children treated with polymyxin, 20 (87%) were unequivocally cured of their infection, which had previously resisted therapy with sulfonamides and other antimicrobial agents. They remained bacteriologically negative for eight weeks after the end of treatment. No toxic side effects of the drug were observed. No difference was noted between the efficacy of polymyxin B and E. Polymyxin appears to be a useful drug for the oral treatment of chronic Shigella infection. Treatment with repeated courses appears feasible in view of the lack of toxicity of the polymyxins taken orally. These drugs are suggested for treatment of entire institutional populations wtih a high endemic incidence of Shigella infection.

Herniated Cervical Disk Simulating Angina Pectoris.—A man, 59, complained of intermittent pain in the substernal and left ulnar regions two years after an acute myocardial infarction. Electrocardiography utilizing unipolar limb leads and multiple chest leads revealed definite evidence of coronary artery disease. The attacks of pain, however, did not follow the pattern seen in angina pectoris, and neurological examination revealed hypalgesia of the ulnar aspect of the left hand and wrist, weakness in flexion of the fourth and fifth fingers, weakness in adduction of all fingers, and weakness in apposition of the thumb and little finger. There was atrophy of all the interossei. These findings suggested nerve root compression. Radiographic study showed diminution of the disk space between the sixth and seventh cervical vertebrae. At operation a large calcified herniated intervertebral disk, which was compressing the left seventh cervical nerve root, was removed. The pain disappeared and has not recurred. This case suggests that in suspected or even proved coronary disease the physician should make a careful examination of the hands in relation to muscular atrophies, weakness, and sensory disturbances. The presence of such findings should arouse suspicion of a possible herniated disk.

Amebiasis: Evaluation of New Therapy.—In the patients studied by Radke the presence of Endameba histolytica was demonstrated in material aspirated from rectosigmoidal lesions or in fecal material. Thirty-five patients with amebiasis were treated with quinacrine and carbarsone, 38 with chloroquine and carbarsone, 33 with aureomycin alone, and 33 with an aureomycin, quinacrine, and carbarsone combination. Five patients included in the quinacrine-carbarsone group, three in the chloroquine-carbarsone group, one in the aureomycin group, and all of those in the aureomycin-quinacrine-carbarsone group had previously been treated unsuccessfully by other means. The quinacrine-carbarsone patients usually became symptom-free within the first five days of treatment. Yellow discoloration of the skin occurred in all patients, and some had nausea and vomiting, which disappeared when treatment was discontinued. The failure rate was 11%. The chloroquine-carbarsone group showed symptomatic improvement within five to seven days. A peculiar paresis of pupillary accommodation, which consisted in an inability to hold the focus longer than a few seconds, occurred in almost every patient. In addition, most of these patients had severe nausea and vomiting, which in two patients necessitated discontinuation of treatment. The failure rate was 78%. Some of the aureomycin-treated group showed symptomatic improvement of bowel symptoms within two days. Nausea, vomiting, and diarrhea developed in about half of the patients. The failure rate was 65%. The aureomycin-quinacrine-carbarsone treated group usually showed improvement of bowel symptoms within the first two days. As in the quinacrine-carbarsone group, a few patients complained of nausea and vomiting. The failure rate was 12%. Radke feels that patients with amebiasis can be managed either with quinacrine and carbarsone or with a quinacrine-aureomycin-carbarsone combination on an outpatient status. He hospitalizes only those with hepatic involvement accompanied by fever, those whom he suspects will not take the drug unless supervised, and those with severe reactions to treatment.

Neurogenic Agent in Acute Pancreatitis.—Experiments by Popper and co-workers in the United States and by Mallet-Guy and co-workers in France were repeated by the authors. Results demonstrated that the splanchnic nerve plays an important part in the pathogenesis of acute pancreatitis. In this nerve two types of fibers are to be distinguished: the preganglionic and efferent vasomotor fibers, the stimulation of which determines vasoconstriction of the abdominal viscera, and the afferent sensory fibers, which under certain conditions may produce intensive arteriolocapillary dilatation. To supply evidence of the causative role of the latter mechanism in acute pancreatitis, additional experiments were carried out on dogs. Tetraethylammonium chloride was injected intravenously, thus inhibiting the vasoconstrictor fibers that cause spasms. After this injection, the left splanchnic nerve was stimulated twice for 20 seconds. Fatty necrosis of the pancreas was produced despite the blocking of the vasoconstrictor fibers. In another series of experiments the splanchnic nerve was sectioned, and, after an interval of 7 to 10 days, stimulation of this nerve was effected by injection of secretin or hydrochloric acid. Thus, sufficient time was allowed for wallerian degeneration to be produced at the peripheral end of the splanchnic nerve. Under these conditions only the afferent sensory fibers with cells in the spinal ganglion degenerate. On the contrary, the vasoconstrictor fibers in the preganglionic neuron are sectioned, while the postganglionic neuron, i. e., the one that produces the vasospasms, remains unimpaired. Necropsy revealed abdominal vasodilatation, and photomicrographs showed "pancreas with edema." Results thus demonstrated that the vasoconstrictor fibers are not the eliciting factor and that it is the stimulation of the sensory fibers of the splanchnic nerve that determines the initial vascular changes of the disease process.

Tenosynovitis.—This paper deals with simple or traumatic tenosynovitis as distinct from pyogenic or granulomatous involvement of the tendon sheaths. The 544 patients here reviewed were studied between 1941 and 1950 and were mostly factory workers, agricultural workers, and housewives. The tendons most frequently affected were the radial extensors of the wrist (extensor carpi radialis longus and brevis) and the abductor pollicis longus or extensor pollicis brevis, either alone or in combination. This lesion accounted for 419 (77%) of the whole series. The main factors in the etiology were change necessitating unaccustomed movement, resumption of work after absence, repetitive stereotyped movement, and local strain. The term tenosynovitis applied to the usual crepitating condition found proximal to the wrist joint is a misnomer. The actual site of the lesion is well above the upper limit of the tendon sheaths at the wrist, which are unaffected, the local pathology suggesting that it is essentially a perimyotendinitis involving the musculotendinous junction higher up in the forearm. It is suggested that peritendinitis crepitans, or perimyotendinitis crepitans, is a more accurate description for this condition and should replace the name tenosynovitis. Simple tenosynovitis, involving the tendon sheaths only, was observed in the other 125 patients. Pathologically, these lesions seem to represent an inflammatory response to strain in particular groups of muscles. The prognosis is good, and cessation of work is neither desirable nor necessary. Rigid immoblization in plaster of Paris is contraindicated and is associated with a high relapse rate. Where the lesion is situated proximal to the wrist, as in peritendinitis crepitans, treatment by immobilization should always include the thumb, because of the frequency with which the latter is involved. This is best effected by means of a detachable plastic splint, which permits very slight movement within the splint and will allow early passive movements to be given every other day. Short wave therapy is valuable in the treatment of certain resistant cases and can conveniently be given when a detachable splint is in use. The splint may be gradually discarded over several days, and the patient can frequently continue at his normal work. Subsidence of signs and symptoms may be expected by the eighth or ninth day of treatment.

Ascorbic Acid and Hypertension.—Previous investigations the effect of ascorbic acid on the blood pressure revealed th the acid given in large doses has a hypotensive effect on norm blood pressure; that the initial hypotension due to sudden posure to cold was prevented by large doses of ascorbic ac and that the hypertension encountered upon long exposures cold was lowered. The present paper confirms the last result a also shows that ascorbic acid has a hypotensive action on perimental hypertension obtained by: (1) excess of sodi chloride in drinking water and (2) renal compression. The hyp tension and adrenal hypertrophy caused by long exposure cold regress when the animals are brought back to normal te perature. In its initial phase, the experimental renal hypertensi is lowered by ascorbic acid but this effect cannot be obtained the chronic phase.

*Considerations on 40 Cases of Cancer of the Lungs. G. Casolo.—p. 532

Cancer of the Lungs.—Clinical observations on 40 patients wi cancer of the lungs are reported. The diagnosis was establish by roentgenologic examination in 16 patients, in 5 by roen genographic detection of bone metastases, in 5 by biopsy supraclavicular or lateral cervical lymph nodes, and in fourteen by bronchoscopy and bronchial biopsy. In one patient the previous diagnosis was confirmed by microscopic examination of tissue expectorated in coughing. *Surgical intervention* seemed justified in three patients. One with adenocarcinoma localized in the upper left lobe underwent lobectomy but died within four months from cerebral metastases. Of the two patients with invasive cancer of the upper lobe who underwent pneumonectomy, one died within six months because of cancer cachexia and one is still living but has metastases in the supraclavicular lymph nodes. Twenty-nine patients died, and there is no hope of recovery for the eight still living. These discouraging data are explained by the fact that the disease was too far advanced at the time of consultation, either because symptoms had been absent or atypical or because the patient had delayed too long before seeking aid. The author reviews the objective and subjective symptoms of pulmonary cancer and stresses the necessity of early diagnosis, which may be facilitated by periodic mass radiography.

*Complex Pseudodeficiency Syndromes After Gastrectomy. R. Cattan, R. Carasso and P. Frumusan.—p. 1109.
Statistical Research on Accidents Caused by Snake Bite in Denmark and in Sweden During Period of 1900 to 1947. H. Marquart.—p. 1110.

Pseudodeficiency Syndromes After Gastrectomy.—Several years ago French investigators reported for the first time the occurrence of a grave and complex deficiency syndrome in patients having undergone gastrectomy. The authors reported in an earlier paper on three patients who had clinical characteristics of progressive emaciation, diarrhea, edema, and anemia, and the biological characteristics of a pronounced fall in serum proteins as well as pronounced hypolipoidemia. The diagnosis of this deficiency syndrome should be based on both clinical and biological criteria. The present report concerns three patients on whom gastrectomy had been performed, two men, aged 37 and 54, and one woman aged 42, in whom an erroneous diagnosis of this deficiency syndrome was made on the basis of clinical observations of emaciation, edema, anorexia, and anemia. Nutritional disturbances simulated a "deficiency syndrome," while a thorough examination revealed a rectoperitoneal metastasis in the first male patient, cirrhosis of the liver in the second, and a deficiency state associated with hypoglycemia in the woman. Although all three presented the clinical characteristics of the true deficiency syndrome, the functional tests were negative. The lipid contents of the blood were normal in all three patients, and the serum proteins did not show any change in the man with rectoperitoneal metastasis nor in the female patient. Only the second male patient had hypoproteinemia, but determination of the galacetose concentration in the urine and puncture biopsy of the liver demonstrated that the hypoproteinemia was attributable to the cirrhosis of the liver. From the observations in these three cases the authors conclude that the true deficiency syndrome is a severe but rare complication of gastrectomy.

Ugeskrift for Laeger, Copenhagen

113:885-918 (July 5) 1951

*Acute Laryngotracheobronchitis in Children. S. O. Siemssen.—p. 885.

Acute Laryngotracheobronchitis in Children.—Siemssen asserts that acute nonspecific laryngotracheobronchitis in children is not well enough known. He attributes to it a number of unexplained deaths in children and cases erroneously diagnosed as primary pulmonary affections. It is defined as a symptom complex depending on an infectious nonspecific, probably virogenic, descending stenosing process in larynx and the lower respiratory passages. In acute cases suffocation is the immediate danger. When the course is more protracted hyperpyrexia and shock threaten as a general reaction to the infection. Pulmonary complications aggravate the prognosis. The disorder is a grave complication in epidemic subglottal pseudocroup. It sometimes, not often, appears as a complication in acute contagious diseases of children. Attention is called to the peculiar regression from laryngeal stridulous dyspnea to superficial tracheobronchial dyspnea without stridor on spread of the stenosing process to the lower respiratory passages. Four cases are presented in detail. With the present day chemotherapy treatment is now attempted along conservative lines. The necessity for careful observation and readiness for possible endoscopic surgical intervention is stressed. The cooperation of practitioners, internists, or pediatricians and otolaryngologists is important.

*Myelosclerosis. A. Pinholt Andreasen.—p. 919.
*Osteosclerosis Disseminata Familiaris: Review and Five New Cases. H. P. Østergård Kristensen.—p. 929.
*Diagnostic Splenic Puncture: Experiences in Examination of 300 Punctates. C. Johansen.—p. 933.

Myelosclerosis.—Andreasen describes six cases of myelosclerosis, each in its way typical. Maturation substances necessary for bone marrow function are thought to be formed or absorbed by the organism and carried by the bloodstream to the bone marrow. The syndrome of myelosclerosis consists of (1) a primary inflammation of the bone marrow with small hemorrhages and necroses followed by fibrosis and sclerosis, (2) extramedullary foci in the spleen, which substitute for the bone marrow and from which immature blood corpuscles enter the peripheral blood, and (3) inhibition of the remaining intact bone marrow. The splenomegaly secondary to the bone changes may become marked. Hemopoietic foci may be found in the liver and, rarely, in the lymph nodes. As there may be larger or smaller areas with normal or hyperplastic bone marrow in between fibrous bone marrow, myelosclerosis cannot be excluded if the first biopsy is normal. Cancer metastases to the bones may give a picture like that of osteosclerosis in myelosclerosis. Careful search for a primary tumor must be decisive in cases with short history; long history testifies against cancer. In every case of chronic aleukemic leukemia or enlarged spleen in supposed polycythemia, the possibility of myelosclerosis should be considered. Many cases in which transition between true polycythemia and chronic myeloid leukemia have been described are believed to have been cases of myelosclerosis, where first the erythropoietic tissue in the spleen then the myelopoietic tissue has predominated. Correct diagnosis of myelosclerosis is important, because the therapy indicated in most of the disorders readily confused with it is contraindicated in myelosclerosis. Splenectomy or powerful irradiation of the spleen deprives myelosclerosis patients of their extramedullary hemopoietic apparatus, and grave blood crises result. Most patients live several years after the diagnosis of myelosclerosis. One of the cases reported was exceptional in that the course was violent and ended fatally a year and a half after diagnosis.

Osteosclerosis Disseminata Familiaris.—Kristensen concludes that osteosclerosis disseminata familiaris is a benign bone disease with generalized symmetric localization, in some cases accompanied by characteristic cutaneous changes. It is a familial constitutional anomaly transmitted by dominant inheritance. The five cases reported, all in one family, were an accidental finding on roentgen examination for other cause. Cutaneous changes seen in two cases were typical in one case, less characteristic in the other. The blood picture, examined in two cases, was normal, as were the serum calcium and serum phosphatase examined in one case. One patient had vague joint symptoms and muscular weakness of transient kind, another had had rheumatic pain in the muscles since childhood.

Diagnostic Splenic Puncture.—Johansen says that in recent years more exact diagnosis of hematological and parahematological affections has become necessary, since the use of such potent therapeutic substances as urethane, 4-aminopteroyl glutamic acid (aminopterin®), radioactive phosphorus, corticotropin, and cortisone depend on the diagnosis. Particularly is this true with regard to the differential diagnosis of chronic myeloid leukemia, leukemoid myeloid reactions, polycythemia, and splenogenic anemias including the nonspecific reticuloses. Examination of the splenic punctate may be a valuable supplement to examinations of the blood and bone marrow in almost all forms of splenomegaly. In obscure and borderline cases, splenic puncture not infrequently gives important information, without which there is danger of institution of wrong treatment, with grave or even fatal consequences.

BOOK REVIEWS

Inhalation Anesthesia: A Fundamental Guide. By Arthur E. Guedel, M.D. Second edition. Cloth. $3.75. Pp. 143. The Macmillan Company, 60 Fifth Ave., New York 11, 1951.

In a book written by one of the venerable men in anesthesia in this country, one expects to encounter indications of philosophic reflection on a practice of anesthesia which has extended over many years and has been of a pioneer nature. Those who read Dr. Guedel's new edition of his standard textbook will be pleased to note that there is ample opportunity for obtaining good insight into his philosophy regarding the practice of high quality anesthesia.

Dr. Guedel developed his original edition as a result of a demand for a forthright manual on the everyday clinical practice of anesthesia. His approach to the problem was based on his extensive experience in instructing a heterogenous personnel during World War I. He has maintained the same simple plan in presenting the material in the new edition, and the neophyte in anesthesia will be able to acquire and apply the material available to him in this book with satisfaction and safety. The book is more on the order of a manual rather than a reference book or complete textbook. Each problem is treated concisely, and there is a minimum of physiologic and pharmacologic background material. There is room for argument about his interpretation of some of the latter material that is included, but this does not detract from the practical usefulness of the book and it is not erroneous.

The format is good, with readable type and appropriate paragraphing. There is a minimum of illustrations but little indication for more. The writing is lucid and the style simple. There is a good reference bibliography, but one is somewhat surprised to find John Snow's excellent monographs missing from the list.

The case reports that are included are presented in a most interesting and homely style and are useful in pointing up common anesthetic problems. These reports give an insight into the tremendously extensive experience in anesthesia that this outstanding man has had. The reports also give a clear representation of how easy it is to overlook details that predispose to nesthetic difficulties.

The book is heartily recommended for those who are looking or a simple introduction into the specialty of anesthesiology and for those who are interested in the experiences and philosophy of a pioneer in the field.

The Electrocardiogram in Pulmonary Tuberculosis. By Allan Björkman, Med. Lic., S.N. [Thesis, M.D., Uppsala University.] Translated by K. M. Lindskog. Paper. Pp. 152. Esselte Aktiebolag, Stockholm, 1951.

This monograph is a study based on careful measurement of the various components of the electrocardiogram in the three standard limb leads in four groups of patients; tuberculous patients, controls, ambulant pneumothorax patients, and patients with acute rheumatic fever. The author observed a greater incidence of abnormal electrocardiograms among tuberculous than the nontuberculous patients. He noted a tendency especially toward lower P and T waves in leads 1 and 2 among the tuberculous patients, the differences from the control group being statistically significant. The various factors that could possibly be responsible for these differences were then studied. They included the incidence of nontuberculous heart disease, changes in heart position due to body build or collapse therapy, the importance of increased heart rate, chronic cor pulmonale, the severity of the tuberculosis, and bed rest. By statistical analysis the author claims that, after all of the above factors are taken into consideration, singly or in combination, they could not be considered the cause of the abnormalities in the P and T waves in the tuberculous patients. He further shows that similar changes occur in acute rheumatic fever. He concludes that the changes in the electrocardiograms in the patients with tuberculosis are due to some as yet poorly understood form of myocardial damag It is hinted that a possible relationship may exist between the electrocardiographic abnormalities and some of the anatom changes in the heart occasionally reported at necropsies tuberculous patients, such as interstitial myocarditis, Aschof nodules, and brown atrophy.

The book is mainly statistical. There are no illustrations chest roentgenograms or electrocardiograms. Limb leads alo were studied. In some cases, in order to isolate some factor f study, repeated subdivisions are made of an initially large grou This leads often to comparisons of groups that have thus beco too small for valid comparison. The book includes a good view of the literature of heart disease and the electrocardiogra in tuberculosis.

The Chemical Senses. By R. W. Moncrieff. Second edition. Cloth. 2 Pp. 538, with 30 illustrations. Leonard Hill Limited, 17 Stratford London, W.1, 1951.

The author gives a detailed account of the modern know edge of taste, smell, and related chemical senses, and he sum marizes the accumulated work of so many chemists, physiolo gists, and psychologists that the total effect is most impressiv The information is well digested, and the treatment is cons quently unified and coherent. Of special medical interest are t discussions of anosmia and parosmia (pages 113 to 119). more general interest are the recent discoveries about tas blindness, as illustrated by phenylthiocarbamide (pages 151-1 169, and 219), and the author's 62 principles relating chemi constitution to odor (pages 300 to 304). The necessarily frequ references to such things as lemon and mint, tansy, and g anium give the book an intrinsic esthetic appeal, but the subj has innumerable practical applications in the processing of fo and the manufacture of cosmetics. Workers in these fields, well as chemists, physiologists, and psychologists, will find t book indispensable. It deserves high praise.

Surgery of the Stomach & Duodenum: A Handbook of Operative gery. By Claude E. Welch, M.D., Associate Visiting Surgeon, Massa setts General Hospital, Boston. Cloth. $8.50. Pp. 349, with illustration Muriel McLatchie Miller. Year Book Publishers, Inc., 200 E. Illinois Chicago, 1951.

It is the experience of most surgeons in charge of surg services in hospitals to find that the interns and residents surgery have but a vague idea regarding the important p cedures on the stomach and duodenum. This confusion is larg due to a profusion of names given to the various operative int ventions on these viscera as well as to the lack of agreem among the surgeons themselves as to what is Billroth I, I roth II, the Hoffmeister, or Reichel. Furthermore, there is quently a lack of understanding of the physiologic effects these procedures. This small volume is intended to fill this g The practical value of the book is in the fact that the aut limits himself to the more important and more frequently p formed operations, to the exclusion of the rarer interventio The author relies more on illustrations than on text. Bre and emphasis on what is important should make this sm volume particularly valuable for the intern, the resident, the younger surgeon.

Handbook of Gynaecology. By Trevor L. S. Baynes, M.D., F.R.C M.R.C.O.G., Consulting Gynaecologist, Bolingbroke Hospital, Lon Cloth. 15s. Pp. 163. Sylviro Publications, Ltd., 19 Welbeck St., Lon W.1, 1951.

This small volume is intended primarily as an outline of gy cology; it contains an excellent summary of the best teach in this subject. It is not the intention of the author that it s stitute as a textbook, but it will function best as a pocket-s manual for candidates for examinations. The field is well c ered, and no criticism is found in the discussions of the subj matter. The book compares very favorably with others used "brush-up" courses.

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated.

Symposium on Burns. Held at request of Committee on Medical Sciences of Research and Development Board, National Military Establishment by Subcommittee on Burns of Committee on Surgery of National Research Council, November 2-4, 1950. Paper. Pp. 207, with illustrations. National Research Council, National Academy of Sciences, 2101 Constitution Ave., Washington 25, D. C., 1951.

The symposium included practically every aspect of the subject of burns. The problem of radiation received considerable attention. Everett I. Evans emphasized that the experiences with the atomic bomb explosion at Hiroshima indicated that death was caused by mechanical trauma, thermal trauma, and radiation. He emphasized that the burn problem in atomic bomb explosion is not that of a simple burn but one that is complicated by radiation injury. The introduction of flame throwers presented physiologic problems which were discussed by James Walker. The subject of fluid and electrolyte requirements in burns was considered in its many aspects. Renal and pulmonary complications accompanying severe burns were presented from the experimental viewpoint and from clinical experience. Treatment of burned area, infections in severe burns, and nutritional care of burn patients occupied a portion of the third session. Early débridement of burn wound, plastic repair of severe burns, as well as the subject of triage and evacuation were included in the discussion. The symposium represents the most recent and most authoritative information on burns. It marks an important step in the functioning of the National Research Council. Its value is that of crystallizing the available information on the subject and probably even leading to reorientation of the entire research program in this important field.

A Doctor's Pilgrimage. By Edmund A. Brasset, M.D. Cloth. $3.50. Pp. 256. J. B. Lippincott Company, 227-231 S. Sixth St., Philadelphia 5, 1951.

Any physician who is engaged in general practice, particularly if he started his practice in a small town during the depression 1930's, will get a great deal of enjoyment from reading Dr. Brasset's "pilgrimage." Even though he may not have practiced in the far corners of Nova Scotia, he will find that Dr. Brasset's friends and patients epitomize the friends and patients of any doctor in any town. Long-forgotten memories will spring to life as he reads descriptions of interesting persons, trying situations, joys and sorrows associated with growing up in medicine.

This is a delightful story that started with a young man in medical school; it follows his thinking and his actions step by step through his first attempts at practice and experience with contract practice, a period in an institution, and finally the joys of a practice that really worked out. Throughout all of this, one can feel the guiding influence of the wise young woman that the doctor married. At the end of the story he reaches the fulfillment of his life-long desire to study brain surgery and discovers that, after all, his life is with his people, so he goes back to take up general practice where he left it.

In small communities physicians might recommend this book to selected friends and patients as a public relations gesture in giving them one doctor's point of view of the attitude physicians have toward patients and people in general. It is a healthy point of view that any physician could well endorse.

Return from the Pole. By Frederick A. Cook. Edited, with introduction, by Frederick J. Pohl. Cloth. $4.50. Pp. 335, with portrait of author. Pellegrini & Cudahy, Publishers, 41 E. 50th St., New York 22, 1951.

Dr. Frederick A. Cook, a former practitioner of medicine in Brooklyn and a widely known explorer, wrote this account of his return from the North Pole in longhand shortly before his death in 1940, at the age of 70. The controversy concerning whether Dr. Cook discovered the North Pole on April 21, 1908, or whether Admiral Perry did so on April 6, 1909, has raged for many years. This book offers new evidence in this dispute. The book is edited by Frederick J. Pohl, writer on exploration and head of the English department of Boys High School in Brooklyn for many years. Mr. Pohl re-examines the evidence in a lengthy introduction to this book. He concludes that Dr. Cook reached the North Pole. Dr. Cook's daughter aided Mr. Pohl in providing the diaries, notebooks, and unpublished writings of her father. The story as told here is tremendously interesting. Dr. Cook was accompanied on his final dash north from Greenland by two young Eskimos. They selected a route which enabled them to feed themselves and their dogs from musk oxen and bears secured along the way for half of the polar distance. As they expected to return along the same route, they left caches of food and equipment at land points every 50 miles. But they became lost on their return journey and traveled a much longer and more hazardous route, which delayed them for a year. They encountered hardships that few human beings have endured. They traveled for days on floating ice, lived for a time on an iceberg, and spent the long arctic night in a cave in which there was room for only one man to stand up at a time and in which they were frequently endangered by wild animals. They suffered from the intense cold and from hunger. Their determination to live and return home nobly demonstrates how the spirit of man can overcome almost unbelievable physical hardships.

Anatomy in Surgery. By Philip Thorek, M.D., F.A.C.S., F.I.C.S., Assistant Clinical Professor of Surgery, University of Illinois College of Medicine, Chicago. Cloth. $22.50. Pp. 970, with 720 illustrations by Carl T. Linden. J. B. Lippincott Company, 227-231 S. Sixth St., Philadelphia 5; Aldine House, 10-13 Bedford St., London, W.C.2; 2083 Guy St., Montreal, 1951.

This excellent volume, which should be well received by the surgical profession, will fill a real need in surgical literature. It is written from a different point of view than have most works on anatomy for surgeons. Operative technic accompanies surgical anatomy. Not all operations are discussed, but in the majority of instances the most important operations are adequately discussed. The volume is not a large one when one considers that the entire body has been covered.

The illustrations are excellent, and the great majority of these are in color. They are attractive and instructional. The material presented is good; it is clearly and concisely presented. Dr. Thorek is an excellent teacher, as this volume demonstrates.

This book is recommended to everyone interested in surgery as a valuable reference volume and at the same time as a volume from which much instruction will be gained. It will be, and should be, well received by the entire surgical profession.

Les ultra-sons appliqués à la médecine. Par André Dénier. Paper. 1000 francs. Pp. 192, with 21 illustrations. L'Expansion scientifique française, 23 rue du Cherche Midi, Paris, 6e, 1951.

The rapidity with which clinical literature on ultrasound has accumulated is astonishing. The report on the 1949 congress on the subject in Erlangen gave a bibliography of 554 references, and a large exhaustive bibliography has recently been supplied by Curry. The present contribution by Dénier summarizes the subject for French readers. It is unfortunately quite uncritical, and the illustration opposite page 96, showing the application of ultrasound to a patient's solar plexus, is typical. The new modality is recommended for everything from enuresis to gingivitis; on page 81 good results are claimed for asthma, and on page 124 the author states that there is nothing to lose by trying ultrasonotherapy for deafness before fenestration. Doubt as to the accuracy of the contents of this book is increased by the unusual number of errors in the bibliography. The "Blades" named on page 67 is a well-known American scientist, and the "Harward" mentioned on page 9 a well-known American university. Schmidt, Pohnssen, and Ohlssen referred to on page 26 are apparently the same as the Schmitt, Johnson and Olson of page 178. The book may be useful to French readers as an introduction to the subject and as a possible source of references that may have escaped other bibliographers but will have little appeal to American physicians.

Summary of Annual Reports of Governments 1949. United Nations Commission on Narcotic Drugs, Economic and Social Council. Paper. 80 cents. Pp. 88. Columbia University Press, 2960 Broadway, New York 27, 1951.

The practicing physician is not apt to be interested in this 88-page pamphlet, which contains information culled from the annual reports submitted by 37 sovereign states and 51 non-self-governing territories. The data presented deal largely with the regulatory control and economic aspects of traffic in narcotic drugs during 1949. Government officials concerned with the enforcement of laws relating to the manufacture, distribution, and sale of narcotic drugs are likely to be most interested in a publication of this nature. Persons concerned with the sociological aspects of drug addiction as a general problem undoubtedly would find it to be a useful reference for obtaining certain valuable and informative data.

QUERIES AND MINOR NOTES

DIABETES MELLITUS

To the Editor:—*A woman, 43, has had diabetes mellitus for three years, and during that period she has lost 20 lb. (9.1 kg.). Her present weight is 118 lb. (53.5 kg.), and her height is 5 ft. 3 in. (160.02 cm.). Her blood sugar averages between 160 and 192 mg. in 100 cc. of blood. Her urine is never sugar-free. For two years she has been taking between 18 and 22 units of protamine zinc insulin daily before breakfast. She was referred to a diabetic specialist, who took her off the insulin and advised her to eat a regular diet. During one week she lost 4 lb. (1.8 kg.). She was then referred to another diabetic specialist, who found 3 + sugar and acetone in the urine. He was not interested in the blood sugar. He advised her to continue with 20 units of protamine zinc insulin daily before breakfast. He did not outline a diet and advised her to eat everything, including bread, potatoes, macaroni, and, occasionally, ice cream. Not once did he perform a blood sugar test. He stated that as long as the patient was symptom-free she need not worry. He diagnosed her case as mild diabetes. In three months she has not gained an ounce. Could you please advise me how she can gain some weight.* *M.D., New York.*

Answer.—It is not stated whether the blood-sugar values were obtained with the patient in the fasting or postprandial state, whether venous or capillary blood was used, or whether the determination was made by a "true" blood-sugar method or one which measures also certain nonglucose reducing substances. However, assuming that the values given were obtained in the fasting state on venous blood samples by the Folin or similar method, then the diagnosis of diabetes would appear to have been established. However, the patient deserves careful study with postprandial as well as fasting blood-sugar determinations and studies to rule out some complication such as hyperthyroidism or tuberculosis.

If possible, the patient should enter a hospital in which a weighed diet may be provided, frequent tests of the blood and urine made, the proper insulin dose established, and detailed instruction given in all phases of the home management of diabetes. The diet should provide 150 to 200 gm. of carbohydrate a day, at least 1 gm. of protein per kilogram of body weight, and sufficient fat to allow the patient to regain weight gradually to within 10 lb. (4.5 kg.) of standard for age, sex, and height. The amount of fat will be presumably between 60 and 100 gm. a day. If on a restricted diet alone a sugar-free urine and satisfactory blood-sugar values cannot be obtained, then insulin should be prescribed in appropriate amount. Presumably this would be of protamine zinc or NPH type without or with an accompanying dose of regular insulin, both given daily before breakfast.

DAMAGE CAUSED BY RIVETING

To the Editor:—*I understand there is a disease of the hands that riveters get from using a riveter for a long time. Is this true?*

Paul L. Stuck, M.D., Wilmington, N. C.

Answer.—The coarse vibration from manual riveting, hot or cold, may result in inflammation in various tissues of the upper extremity and notably lead to tenosynovitis. Another condition, "dead fingers" or "white fingers," is caused by more rapid and finer vibrating tools. For production reasons and to avoid noise (the chief riveting offense) as well as tenosynovitis, much riveting is accomplished by "squeezing." This calls for a different type of equipment, which is commercially available. At present, welding of various types has extensively replaced riveting. The "squeeze" method eliminates both noise and vibration.

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

HIATUS HERNIA

To the Editor:—*May I have the latest information on th treatment of diaphragmatic hernia (hiatus)? The patient i aged 73 and has some cardiospasm. There is a sense of di comfort in the mediastinal region, eructation of gas, regurg tation, cough, and expectoration of frothy mucus, day an night. There is cardiac arrhythmia and distress from flat lence, constipation, nervousness, and insomnia. The labor tory reports are normal. The x-ray diagnosis is hiatus.*

M.D., California.

Answer.—The best treatment for hiatus hernia is a tran pleural operation on the left side. Such an approach gives b far the best exposure and, therefore, makes it easier to corre the condition. As a part of the operation it is desirable to r move the sac, as in an operation for any other kind of herni There is some difference of opinion as to whether it is desirabl to paralyze the diaphragm temporarily by crushing of the phreni nerve. To any surgeon with wide experience in intrathoraci surgery the operation is not a difficult one, and it carries low mortality.

The risk in a patient aged 73 is, of course, greater than in a younger person. Sometimes some relief of symptoms may b obtained if the phrenic nerve is crushed in the neck, which naturally an operation of less magnitude. This procedure, how ever, may also sometimes be accompanied by distressing sym toms. One cannot be certain, therefore, whether with the simp phrenic operation of the neck the patient's condition will better, worse, or unchanged.

ISOPROPYL ALCOHOL

To the Editor:—*Please advise me whether isopropanol (refin 91%) can be used in place of ordinary rubbing alcohol general practice for alcohol sponges, giving hypodermics, a cleaning needles and syringes. I clean my hands after exam ing a patient (in the home) with alcohol sponges. Would peated cleansings of the hands with this agent cause deleterious effects?* *M.D., West Virginia*

Answer.—Isopropyl alcohol (isopropanol) may be substitu for ethyl alcohol in many instances. In physical propertie closely resembles ethyl alcohol; it is readily miscible with wa in all proportions and possesses fat solvent properties somewh greater than ethyl alcohol.

Isopropyl alcohol rubbing compound N.F. contains 68 to 72 of isopropyl alcohol, by volume, in water, with or without cer fied coal tar colors and perfume oils. As a disinfectant, isopro alcohol possesses antibacterial properties and limitations simi to those of ethyl alcohol. Neither is sporicidal and should not relied on for sterilization. Many vegetative forms of bacteria destroyed by both alcohols, and isopropyl alcohol is frequen utilized for the disinfection of oral thermometers. Isopro alcohol is available commercially as 91 to 99% by volume; m authorities recommend the concentrated solutions for use as disinfectant, although others recommend 50 to 80% solutio Isopropanol combines readily with proteins and should not used for primary cleansing of syringes and needles. The co mercial preparation may contain spore-forming micro-orga isms, which can be removed by bacterial filters; after filtratio the solution may be used for storage of sterile instrument needles, and syringes. An antioxidant (rust preventer, e. g., s dium nitrate, sodium borate) may be incorporated in solutio used for storage of instruments. For skin disinfection, alcoh and other chemical agents should not be substituted for thorou mechanical cleansing.

The irritant properties of isopropyl alcohol are similar to thos of ethyl alcohol; all syringes and needles should be free fro residual amounts of these compounds prior to hypodermic inje tions. Studies with undiluted and 50% isopropyl alcohol appl cations, twice daily for 25 days, to areas of about 300 sq. cm.

the arms of three persons failed to produce skin irritation or absorption. Local effects, similar to those produced by ethyl alcohol, result from wearing bandages saturated with isopropyl alcohol.

Isopropyl alcohol is a clear, colorless liquid with a slightly bitter taste. It has been reported that humans have imbibed 0.5 to 22 cc. of isopropyl alcohol in strengths comparable to that of wine or whiskey with no evidence of exhilaration or incoordination, although headaches resulted after two or three hours, the pulse was lowered, and some loss in appetite was noted. Inhalation of the vapors does not cause the visual defects associated with methyl alcohol. Isopropyl alcohol requires no government permit or record of its disposition, is not subject to the taxation requirements exercised by the federal government on ethyl alcohol, and therefore has "price appeal" as a disinfectant and solvent.

GAUCHER'S DISEASE AND ATRESIA OF BILE DUCTS IN INFANTS

To the Editor:—*A patient asked whether she could expect a normal child if she should attempt a third pregnancy. In 1946 she delivered a 6½ lb. (2,948 gm.) male at term, who died at 26 months of Gaucher's disease. In September, 1950, she delivered her second child, a 7½ lb. (3,289 gm.) girl who was jaundiced at birth; she was operated on in her third month and found to have atresia of the bile ducts. This child died in her sixth month. The mother's Kahn reaction is negative. She is Rh positive and has always been in good health. The father is also Rh positive (anti-Rho "anti-D" 85%).*

M.D., Missouri.

Answer.—The clinical story presented is not that of isosensitization in pregnancy, and this is borne out by the fact that the patient is Rh positive. The history of the first baby dying from Gaucher's disease and the second with atresia of the bile ducts is indeed remarkable. The cause of these two anomalies is unknown, and, though they appear to be genetically determined, they certainly are not related to each other. With respect to Gaucher's disease, there is evidence of its hereditary transmission as a mendelian recessive, so that when both parents are normal carriers of the gene, as in the present case, one-fourth of the children will be affected. Therefore, the chance of this condition's recurring in subsequent children is 1 in 4. With respect to congenital malformation of the bile ducts, this also appears, at least in some families, to be inherited as a recessive, and Sweet encountered a family in which three consecutive infants died from complete atresia of the bile ducts. Since presumably Gaucher's disease and atresia of the bile ducts are independently inherited, and for each condition the chance of the baby's being unaffected is three-fourths and of being affected is one-fourth, the prospect for the next baby would be as follows: perfectly normal, 9/16; affected with Gaucher's disease but without atresia of the ducts, 3/16; having atresia of the ducts but not Gaucher's disease, 3/16, and affected by both conditions, 1/16.

POLYCYTHEMIA RUBRA VERA AND BLOOD TRANSFUSIONS

To the Editor:—*Should persons with polycythemia rubra vera be used as donors in routine blood transfusion work?*

Merrill J. Wicks, M.D., Tacoma, Wash.

Answer.—There is no sound scientific contraindication to the use of blood from persons with polycythemia rubra vera. Many blood banks have routinely given transfusions of such blood to patients. The infusion of such blood has not been accompanied by any complications or increased incidence of reactions. Refusal to use such blood is primarily based on esthetic grounds.

IDIOPATHIC ALOPECIA

To the Editor:—*A girl, 17, complains of gradual loss of hair for a period of six months. The hair is very thin over the entire scalp. There is no obvious disease of the scalp itself. This patient's diet is adequate, and there is no history that would indicate any endocrine dysfunction. The remaining hairs appear healthy. This is not a patchy loss, as with alopecia areata. Have you any suggestions?*

M. A. Shillington, M.D., Glendive, Mont.

Answer.—From the description it would seem that this patient has mild, diffuse alopecia. A note as to the condition of the hair elsewhere on the body might have been of some help. If there is no obvious disease of the scalp, if the patient has not been ill recently, and if she manifests no evidence of systemic disease at present, she probably has idiopathic alopecia. It would also be well to know whether her father or brothers became bald prematurely. If the scalp is tight, it might be that mild, constant irritation with the following prescription would be of help; cade oil, 20%; precipitated sulfur, 10%; salicylic acid, 5%, and qualatum (petrolatum 90%, glycerol monostearate 10%), in a quantity sufficient to make 1 oz. (30 cc.). This should be applied directly to the scalp, in small amounts, and should be rubbed in vigorously. The hair should be shampooed the following day. Medication other than local is not helpful in conditions such as this.

AMENORRHEA FOLLOWING SHOCK TREATMENTS

To the Editor:—*A schizophrenic patient received seven shock treatments, after which she was discharged and permitted to return home. It is now three months since her last treatment, and she has not yet menstruated. She is 22 years old and began menstruating at 15. Her periods were always late, usually at six or eight week intervals. My patient is disturbed over the delay. I would appreciate any suggestions you may offer.*

J. S. Wagner, M.D., Glendale, N. Y.

Answer.—Kalinowsky and Hoch (Shock Treatments and Other Somatic Procedures in Psychiatry, New York, Grune and Stratton, 1946) say: "Menstruation often ceases during a long course of ECT. In these patients as well as in those in whom amenorrhea already accompanied the psychosis prior to treatment, normal function usually returns about two months after successful treatment. This is likewise true in many cases of so-called involutional psychosis at the age of between 45 and 50, when menstruation had ceased but returns. These patients who become amenorrheic only during the treatment but regain their regular cycles sometime after, demonstrate that the psychosis alone does not explain the endocrine disturbance, but that the treatment itself probably influences the diencephalic centers for these endocrine functions. It may be added that amenorrhea during ECT is not limited to psychotics alone but is seen in neurotics as well."

ABSENCE OF DUCTUS DEFERENS

To the Editor:—*A patient was told by a urologist that he has congenital absence of the ductus deferens but that a biopsy of the testicle revealed that active, viable spermatozoa were being formed. Can semen be taken from the testicle, mixed with saline and injected into his wife's uterus at the fertile time of the month, with any hope that the wife will be impregnated?*

James G. Gaume, M.D., Ellinwood, Kan.

Answer.—Semen can be taken from the testicle, mixed with saline and injected into the wife's uterus. The chances of effecting a pregnancy, however, are very small. Intracervical introduction of a mixture of semen and Ringer's solution has been found successful in a few cases. Small amounts of semen, less than 1 cc., should be used for each insemination. Great patience must be exercised, as success in these cases depends on precise synchronization with ovulation. The longevity index of spermatozoa obtained by testicular puncture and maintained in Ringer's solution is greatly diminished. If this procedure is unsuccessful, then adoption or donor artificial insemination should be considered.

SUBCUTANEOUS OXYGEN THERAPY

To the Editor:—*A 73-year-old man in severe subacute myocardial failure following two episodes of acute failure has had left bundle branch block and severe arteriosclerotic heart disease for the past 12 years. After one week in an oxygen tent with the usual therapy, his status was still critical. Another physician began subcutaneous abdominal oxygen therapy, giving 500 to 750 cc. once or twice daily. After a week of this treatment in addition to our own treatment and expert nursing care around the clock, he is still seriously ill, but not in the critical condition he was in one week ago. I cannot conceive of how this mode of oxygen therapy can be of any value, especially since he receives over 6,000 liters daily while in the tent. I would appreciate a clear-cut statement from one of your authorities.*

Irving C. Shavelson, M.D., Atlantic City, N. J.

Answer.—There is no proof of benefit from subcutaneous oxygen. Certainly, inhalation will supply very much more oxygen. Also, subcutaneous abdominal oxygen therapy is a nuisance, and it would seem preferable to omit it. This patient's improvement is doubtless due to other reasons, in particular the natural tendency of cardiac patients to improve with rest, expert nursing care, and the other therapy mentioned.

ARTHRITIC JOINTS

To the Editor:—*Is there any acceptable method of treatment to separate bone on bone pressure in chronic rheumatoid arthritis with absorption of most of the articular cartilages, e. g., in a knee joint? We understand fibers such as nylon have been tried. Would a heavy sterile oil be practical?*

Malcolm L. Raymond, M.D., Johnstown, Pa.

Answer.—Kuhns and Potter (*Annals of the Rheumatic Diseases* **10:**22 [March] 1951) reported the successful use of a nylon membrane in arthroplasty of the knee in patients with rheumatoid arthritis. The material is inert in tissue and favors the formation under the membrane of fibrous tissue resembling fibrocartilage. Another inert substance, vitallium, has proved useful in arthroplasty of the hip joint, but molds of the material applicable to the knee and other joints have not yet been developed. Injection of oil into arthritic joints was tried as far back as 1914, evidently with poor ultimate results, since the method was abandoned.

DETECTION OF INCIPIENT CANCER

To the Editor:—*Three employees in our organization present definite and proved histories of malignancy in their families, some as far back as three generations. As the chances of these employees' developing cancer are statistically high, what general measures, apart from frequent physical examinations with laboratory adjuncts, can be undertaken to detect, as early as possible, the incipiency of malignant changes in one organ or another?* *M.D., Tenn.*

Answer.—Examinations to determine whether a person has early cancer or pathologic changes that might influence malignant change have proved satisfactory in detecting early disease. If the three employees of your organization were to be checked thoroughly every six months and subjected to proctoscopic examination, cytologic studies of all body secretions, and x-ray examinations as indicated, this would be the only protection that could be given. There are no laboratory tests on the blood or urine that would give any additional information.

LYMPHATIC LEUKEMIA IN THE NEWBORN

To the Editor:—*Is acute lymphatic leukemia in a newborn infant a rare condition?*

Charles W. Shlimbaum, M.D., Bay Shore, N. Y.

Answer.—Acute leukemia or acute lymphocytic leukemia is the commoner form of leukemia seen in children. The blood findings are severe anemia, thrombopenia, and varying numbers of immature and abnormal lymphocytes, mostly lymphoblasts. Leukocytosis of from a few thousand to several thousands is encountered. The clinical appearance of the infant or child is that of pallor, asthenia, enlargement of cervical nodes, skin hemorrhages, cough, dyspnea, stomatitis, and enlargement the abdomen. The disease if untreated is fatal in a few weeks a few months; however, the use of folic acid antagonists, cortic tropin (ACTH), and cortisone has prolonged life in a sm percentage of cases. Cooke (*J.A.M.A.* **101:**432 [Aug. 5] 19 analyzed 50 cases of acute leukemia in children in a period 15 years. Onset varied from birth to 9 months of age. In th older children the ratio of males to females was 2 to 1, b in the younger age group this disproportionate incidence was n found.

THE CORONARY ARTERIES IN RHEUMATIC HEART DISEASE

To the Editor:—*In rheumatic heart diseases, are there chang in the coronary arteries sufficiently significant to result in pro nounced impairment of the coronary blood supply to t myocardium?* *Aaron N. Gorelik, M.D., Bronx, N. Y.*

Answer.—There have been several pathological reports show ing that there may occur in the coronary arteries, as in oth arterial beds, arteritides which, by pronounced intimal prolifer tion, with and without superimposed thrombosis, can produ sufficient narrowing or actual occlusion of the coronary arteri and their branches to cause impairment of the coronary circu lation. In fact, some hold that myocardial infarction, especiall in the younger age group, is often on the basis of such arteritides however, in any particular case the pathological diagnosis o the specific etiology of the arteritis seen microscopically can usually be made only by implication, since the arterial change may be the same, although the cause varies. Among the caus that have been held responsible for these lesions is rheumat arteritis.

INJECTIONS OF AMINOPHYLLINE

To the Editor:—*A white man, 29, has had bronchial asth since childhood. In the last four years he has been giv intravenous aminophylline, 3¾ grains (0.26 gm.), almost d and during a severe attack three or four times daily. He probably received over 1,000 injections of aminophyll What is the danger, if any, of continuing this thera Epinephrine gives no relief, nor does it seem that other m cations help.* *M.D., New York*

Answer.—It is unlikely that continuation of this therapy give rise to any serious ill effects. Aminophylline is nont and has, like other xanthine preparations, been given for y for its diuretic action without any evidence of toxicity ei clinically or pathologically. If injected intravenously too rapi it may lead to syncope. In persons who are hypersensitive to drug, symptoms of excessive cerebral stimulation, incl wakefulness, vomiting, and generalized convulsions, may pe Although such manifestations of hypersensitivity are gener to be expected early in the course of aminophylline ther development of hypersensitivity after protracted use is impossible and should be watched for.

EFFECT OF TEMPERATURE ON BLOOD COAGULATION

To the Editor:—*Is a correction required of the values obtai for coagulation tests at various temperatures, within the li of working conditions in an office (e. g., 16 C to 28 C)? I please quote literature or give formula.* *M.D., New Yor*

Answer.—Temperature exerts a marked influence on speed of blood coagulation. Comparative tests showed coag tion times varying from 6¾ to 8 minutes at 37 C and from 1 to 16 minutes at 22 C in normal persons, and from 25 to minutes at 37 C and from 76 to 121 minutes at 22 C in he philiacs. In the tests quoted all factors known to influence agulation were controlled. The causes of these variations are known. For these reasons there is no suitable correction form It is recommended that the test tubes be inserted in a wa bath at 37 C. Quick (Quick, A. J., Honorafo, R. C., and Stefani M.: The Value and the Limitations of the Coagulation Ti in the Study of the Hemorrhagic Diseases, George R. Mi Symposium on Hematology, New York, Grune & Stratton, 19 pp. 400-409) recommends an ordinary vacuum bottle filled w water at 37 C as a handy water bath.

TREATMENT OF ESSENTIAL AND MALIGNANT HYPERTENSION

Irvine H. Page, M.D., Cleveland

The problem of etiology of essential and malignant hypertension remains all important because the day must come when treatment will be meshed with it, rather than follow the current practice of treating hypertension of different causes with the same remedy. Knowledge of etiology is, however, in a state of flux, as can be appreciated from recent reviews.[1] Much of what I shall say about treatment probably will be ephemeral, though it now represents the views of my associates, Drs. A. C. Corcoran and R. D. Taylor, as well as my own.

SEDATIVES AND PROPYLTHIOURACIL

Drugs such as phenobarbital or mixtures of chloral hydrate and potassium bromide are probably the most useful means of promoting daytime relaxation without too much sleepiness. We do not use sedatives as a routine although in some unusually tense patients their effect is gratifying. Excessively irritable, anxious, and difficult patients are several complaints ahead of the physician. There is nothing he can suggest that they haven't already tried, usually with dire results. In these we have had some success with propylthiouracil (200 mg. four times a day). After about a month the patients quiet down and a startling reversal of their behavior pattern may occur. We have not had enough experience with this drug, or with the more lasting effects of I^{131} as used by Herrman Blumgart, to evaluate the long-term response.

DIET

In overweight hypertensive patients the total caloric intake should be reduced, and that marks about the only area in which agreement exists. Starvation or inadequate diets lead to blood pressure reduction, but at the cost of well-being. The problem of the effect of sodium intake on blood pressure has been the most contentious of all. Allen and Sherrill [2] no doubt saw many good results years ago from salt restriction. Grollman and his associates [3] refined the treatment by more exacting requirements. But there are many who have yet found no convincing evidence in favor of such diets.[4] The problem has been reviewed so adequately,[5] that I need not do it again.

From the experimental viewpoint it is clear that hypertensive animals respond in different ways to salt deprivation. For example, the blood pressure of rats with their kidneys wrapped in silk is highly responsive to the salt content of the diet. This is in sharp contrast to dogs. The contrasts are quite as sharp among patients. Some respond very satisfactorily and others not at all. My colleagues and I have the impression that about one quarter respond satisfactorily to salt restriction.[6] In general, the percentage of claimed clinical success rises as the study of the patients becomes increasingly lax and uncritical. Without a most rigid control, to maintain a diet containing less than 200 mg. of sodium is impractical. It is doubtful that diets which provide more than 500 mg. of sodium affect arterial pressure. Congestive failure and other edemas usually require much less drastic restriction. It is the unusual patient who can follow the diet successfully out of the metabolic ward, and studies made without the most exacting control have greatly confused the field. Even under the best conditions only a minority can expect any substantial benefit. Nevertheless, this minority is not inconsiderable, and the drastic low-sodium diet, if used under close supervision, is valuable. We build the diet around a salt-free milk (lonalac®), potatoes (especially baked), oleomargarine, and sugar and are able to provide not only adequate calories but also a satisfying variety of reasonably priced foods. Salt substitutes may or may not be used according to individual taste. With a little ingenuity a good variety of foods may be prepared which are salt-free. Possibly we should call this our "potato diet." Recently an excellent "salt-free"

SUBCUTANEOUS OXYGEN THERAPY

To the Editor:—*A 73-year-old man in severe subacute myocardial failure following two episodes of acute failure has had left bundle branch block and severe arteriosclerotic heart disease for the past 12 years. After one week in an oxygen tent with the usual therapy, his status was still critical. Another physician began subcutaneous abdominal oxygen therapy, giving 500 to 750 cc. once or twice daily. After a week of this treatment in addition to our own treatment and expert nursing care around the clock, he is still seriously ill, but not in the critical condition he was in one week ago. I cannot conceive of how this mode of oxygen therapy can be of any value, especially since he receives over 6,000 liters daily while in the tent. I would appreciate a clear-cut statement from one of your authorities.*

Irving C. Shavelson, M.D., Atlantic City, N. J.

Answer.—There is no proof of benefit from subcutaneous oxygen. Certainly, inhalation will supply very much more oxygen. Also, subcutaneous abdominal oxygen therapy is a nuisance, and it would seem preferable to omit it. This patient's improvement is doubtless due to other reasons, in particular the natural tendency of cardiac patients to improve with rest, expert nursing care, and the other therapy mentioned.

ARTHRITIC JOINTS

To the Editor:—*Is there any acceptable method of treatment to separate bone on bone pressure in chronic rheumatoid arthritis with absorption of most of the articular cartilages, e. g., in a knee joint? We understand fibers such as nylon have been tried. Would a heavy sterile oil be practical?*

Malcolm L. Raymond, M.D., Johnstown, Pa.

Answer.—Kuhns and Potter (*Annals of the Rheumatic Diseases* **10**:22 [March] 1951) reported the successful use of a nylon membrane in arthroplasty of the knee in patients with rheumatoid arthritis. The material is inert in tissue and favors the formation under the membrane of fibrous tissue resembling fibrocartilage. Another inert substance, vitallium, has proved useful in arthroplasty of the hip joint, but molds of the material applicable to the knee and other joints have not yet been developed. Injection of oil into arthritic joints was tried as far back as 1914, evidently with poor ultimate results, since the method was abandoned.

DETECTION OF INCIPIENT CANCER

To the Editor:—*Three employees in our organization present definite and proved histories of malignancy in their families, some as far back as three generations. As the chances of these employees' developing cancer are statistically high, what general measures, apart from frequent physical examinations with laboratory adjuncts, can be undertaken to detect, as early as possible, the incipiency of malignant changes in one organ or another?*

M.D., Tenn.

Answer.—Examinations to determine whether a person has early cancer or pathologic changes that might influence malignant change have proved satisfactory in detecting early disease. If the three employees of your organization were to be checked thoroughly every six months and subjected to proctoscopic examination, cytologic studies of all body secretions, and x-ray examinations as indicated, this would be the only protection that could be given. There are no laboratory tests on the blood or urine that would give any additional information.

LYMPHATIC LEUKEMIA IN THE NEWBORN

To the Editor:—*Is acute lymphatic leukemia in a newborn infant a rare condition?*

Charles W. Shlimbaum, M.D., Bay Shore, N. Y.

Answer.—Acute leukemia or acute lymphocytic leukemia is the commoner form of leukemia seen in children. The blood findings are severe anemia, thrombopenia, and varying numbers of immature and abnormal lymphocytes, mostly lymphoblasts. Leukocytosis of from a few thousand to several thousands is encountered. The clinical appearance of the infant or child is that of pallor, asthenia, enlargement of cervical nodes, skin hemorrhages, cough, dyspnea, stomatitis, and enlargement the abdomen. The disease if untreated is fatal in a few weeks a few months; however, the use of folic acid antagonists, corticotropin (ACTH), and cortisone has prolonged life in a small percentage of cases. Cooke (*J.A.M.A.* **101**:432 [Aug. 5] 19 analyzed 50 cases of acute leukemia in children in a period 15 years. Onset varied from birth to 9 months of age. In the older children the ratio of males to females was 2 to 1, but in the younger age group this disproportionate incidence was found.

THE CORONARY ARTERIES IN RHEUMATIC HEART DISEASE

To the Editor:—*In rheumatic heart diseases, are there changes in the coronary arteries sufficiently significant to result in pronounced impairment of the coronary blood supply to the myocardium?*

Aaron N. Gorelik, M.D., Bronx, N. Y.

Answer.—There have been several pathological reports showing that there may occur in the coronary arteries, as in other arterial beds, arteritides which, by pronounced intimal proliferation, with and without superimposed thrombosis, can produce sufficient narrowing or actual occlusion of the coronary arteries and their branches to cause impairment of the coronary circulation. In fact, some hold that myocardial infarction, especially in the younger age group, is often on the basis of such arteritides; however, in any particular case the pathological diagnosis of the specific etiology of the arteritis seen microscopically can usually be made only by implication, since the arterial changes may be the same, although the cause varies. Among the causes that have been held responsible for these lesions is rheumatic arteritis.

INJECTIONS OF AMINOPHYLLINE

To the Editor:—*A white man, 29, has had bronchial asthma since childhood. In the last four years he has been given intravenous aminophylline, 3¾ grains (0.26 gm.), almost daily and during a severe attack three or four times daily. He has probably received over 1,000 injections of aminophylline. What is the danger, if any, of continuing this therapy? Epinephrine gives no relief, nor does it seem that other medications help.*

M.D., New York.

Answer.—It is unlikely that continuation of this therapy will give rise to any serious ill effects. Aminophylline is nontoxic and has, like other xanthine preparations, been given for years for its diuretic action without any evidence of toxicity either clinically or pathologically. If injected intravenously too rapidly it may lead to syncope. In persons who are hypersensitive to the drug, symptoms of excessive cerebral stimulation, including wakefulness, vomiting, and generalized convulsions, may occur. Although such manifestations of hypersensitivity are generally to be expected early in the course of aminophylline therapy, development of hypersensitivity after protracted use is not impossible and should be watched for.

EFFECT OF TEMPERATURE ON BLOOD COAGULATION

To the Editor:—*Is a correction required of the values obtained for coagulation tests at various temperatures, within the limits of working conditions in an office (e. g., 16 C to 28 C)? If so, please quote literature or give formula.* *M.D., New York.*

Answer.—Temperature exerts a marked influence on the speed of blood coagulation. Comparative tests showed coagulation times varying from 6¾ to 8 minutes at 37 C and from 1 to 16 minutes at 22 C in normal persons, and from 25 to minutes at 37 C and from 76 to 121 minutes at 22 C in hemophiliacs. In the tests quoted all factors known to influence coagulation were controlled. The causes of these variations are not known. For these reasons there is no suitable correction formula. It is recommended that the test tubes be inserted in a water bath at 37 C. Quick (Quick, A. J., Honorato, R. C., and Stefanini, M.: The Value and the Limitations of the Coagulation Time in the Study of the Hemorrhagic Diseases, George R. Minot Symposium on Hematology, New York, Grune & Stratton, 19 pp. 400-409) recommends an ordinary vacuum bottle filled with water at 37 C as a handy water bath.

For this reason, their prognostic value is low and often misleading both to patient and physician.

To those of us who have studied the problem for years, it is becoming more and more certain that the cholesterol level rises in some persons as they get older and not in others. It may be that the more free a person is from vascular or other disease, the less likely there will be a rise in cholesterol with age. But which is cart and which is horse?

The ultracentrifugal studies initiated by Gofman have possibilities in delineating the problem that may be more promising than simple chemical analysis. This remains to be proved. Whatever the final interpretation given this work, Gofman has made an important contribution toward stimulating investigation and understanding of atherosclerosis.

I will add a word of warning about interpretation of blood cholesterol figures and ultracentrifuge analysis. Evidence to date merely indicates that in some patients with atherosclerosis or coronary disease, cholesterol or S_f 10-20 molecules may be slightly elevated (S stands for Svedberg units [one S equals 10^{-3} cm./sec./dyne/gm.] and the subscript f stands for *flotation* [negative sedimentation]). Statistically they may be significantly above normal. But in the interpretation of individual values they may be completely misleading and do much harm. The range of normal variation for serum cholesterol can be as much as 100 mg. per 100 cc. Thus, with a mean of, say, 224, it could be 324 or 124 and yet be normal.

Statistically, slight hypercholesterolemia may prove of interest to science, but for individual patients it proves nothing as to the occurrence or development of arteriosclerosis. Insurance companies can prove statistically that obesity shortens life, but the tables can tell nothing about the longevity of the individual.

For reasons such as these, I warn you against the indiscriminate use of the measurements of S_f 10-20 molecules, cholesterol, or anything else to indicate the nature or advance of arterial disease. I have no doubt that we are grossly oversimplifying the problem of both the etiology and treatment of arteriosclerosis. Lest we do more harm than good, let us refrain from drawing hasty conclusions. Nature has a way of striking back at those who too grossly touch on her guarded secrets.

Before we get too afraid of cholesterol in our diets, an example of the results of studies done with Dr. Lena Lewis should be considered.

A hypertensive arteriosclerotic patient studied in the Cleveland Clinic Hospital for over a year had suffered a stroke and his fundal vessels were markedly sclerotic. In short, he might have been expected to have hypercholesterolemia and a high content of the S_f 10-20 plasma lipoprotein. Actually on a drastic low-sodium diet containing 0.8 gm. of cholesterol the total serum cholesterol was normal as were the molecules of the S_f 10-20 class. He was then placed on a diet containing about 4 gm. of cholesterol, and a supplementary 10 gm. was given as well. Animal fats were abundant. He remained on it a month. No change occurred in either cholesterol or molecules of the S_f 10-20 class. Then 125 gm. of oleomargarine was added to the high cholesterol regimen. Although such a diet is hard to swallow, he valiantly followed it for two months with still no change. Thus, even with highly abnormal increases in both fat and cholesterol in an arteriosclerotic hypertensive patient, no significant change in these blood constituents occurred.

TABLE 1.—*Effect of Diet Change on an Arteriosclerotic Hypertensive Patient*

This must be contrasted with patients in whom the response to changes in cholesterol and fat feeding and withdrawal are sometimes quite large. An example from our study concerns a woman, 27 years of age, with malignant hypertension and chronic cardiac failure. She was almost constantly in the hospital under careful dietary supervision. A diet containing an overwhelming amount of cholesterol (4 gm. in the diet plus 10 gm. in capsules) and also rich in animal fat in a period of weeks elevated the S_f 10-20 molecules from 66 to 106 mg. Total and free cholesterol did not rise correspondingly. She was then put on a diet low in cholesterol (0.3 gm.) and high in vegetable fat. Eleven days later the S_f 10-20 molecules had fallen back to the original level of

68 mg. and there was a further slow but progressive fall without a corresponding reduction in cholesterol. A shift to a low-cholesterol, low-fat diet did not accelerate the fall. On a diet unrestricted in lipid but low in salt the S_f 10-20 fraction continued slightly downward, but by this time the patient was losing weight and not far from death.

These results show that a diet excessively high in cholesterol and animal fat in a hypertensive patient with an already elevated S_f 10-20 fraction may further elevate it. Substitution of a low-cholesterol, high-vegetable-fat diet was associated with a marked fall which was not further enhanced by making the diet low in fat as well. Neither total serum nor free cholesterol nor lipid phosphorus reflected these changes as did the S_f 10-20 fraction.

Thus, whether vegetable fat as well as cholesterol and animal fat should be reduced in the diet is still undecided. Some evidence suggests that blood cholesterol is responsive only to diets which are virtually free of fat and cholesterol. My personal experience with this regimen was not a happy one. I lost weight, experienced digestive disturbances, and looked at the world with a jaundiced eye. With better dietary planning it would have been possible to maintain weight and still keep the diet cholesterol-poor. Whether that would have been advantageous, I do not know. The best advice I can give at the moment is to wait until investigators have arrived at solid conclusions before recommending wide changes in your patient's diet.

TABLE 2.—*Effect of Change in Cholesterol and Vegetable Fat in a Patient with Malignant Hypertension*

* Died in cardiac failure.

SURGERY

Seventeen years ago treatment of hypertension was undertaken by some bold surgeons, especially Adson, Heuer, Peet, Smithwick, and Grimson, to mention only the pioneers. Thousands of patients have since been operated on. The accumulated data confirm a pattern that was perceptible almost from the first: there are a few brilliant successes, some patients are definitely benefited, and some not at all. The ratio of response hasn't changed much over the years, as E. V. Allen has so judiciously pointed out.

Most are agreed that Smithwick's lumbodorsal ganglionectomy currently is generally the best and most practical type of operation. The complete sympathectomy of Grimson may yet find its place, but it is at present more experimental. We know no way to predict which patient will benefit or in what degree. To the common-sense rules the only exceptions are that patients with malignant hypertension, as we originally found,[10] much to our surprise, often do well, and that the same is true in patients with hypertensive heart disease and, paradoxically, with renal hypertension. Unfortunately success can not be counted on. We resort to sympathectomy when over a period of months or years the progress blood vessel disease is objectively demonstrable a medical management has either failed or proved i practical.

The future of sympathectomy depends on findi some reliable and objective method for the selection patients. If the many useless operations could be avoi and operations performed only when good results can assured, sympathectomy might have a permanent pl in treatment. Our own current practice is to determine direct recording of blood pressure the patients' respo pattern to substances such as tetraethylammoni chloride, which block nervous transmission at autono ganglia. McCubbin and I[11] have been able to establis characteristic pattern in dogs with chronic neuroge hypertension. Similar responses occur in some patien We hope this approach may yield a more rational meth of selection.

TOTAL ADRENALECTOMY

With the advent of adequate supplies of adrenal c tical hormones, it has been possible to do what had lo seemed desirable as a result of experiments on hype tensive animals. Total adrenalectomy in dogs with renal hypertension results in a fall of arterial pressure to normal. This was a striking observation. Administration of relatively small amounts of cortical steroids restored the original hypertensive levels. Clearly, the adrenal cortex plays a decisive role in maintainance of arterial pressure. Even before the experimental contributions, DeCourcy, Crile, and others had foreshadowed some of these modern developments and performed adrenal denervations and partial adrenalectomy. Current experimental adrenalectomy in patients is born of the confidence that adequate supplies of adrenal hormones are available. Green, Nelson, Dodds, and Smalley [12] published the report of the first case of total adrenalectomy adequately treated, and subsequently several groups have undertaken study of the problem.

[10] Page, I. H., and Heuer, G. J.: Treatment of Essential and Malignant Hypertension by Section of Anterior Nerve Roots, Arch. Int. Med. **59:** 245 (Feb.) 1937.

[11] Page, I. H., and McCubbin, J.: The Pattern of Vascular Reactivity in Experimental Hypertension of Varied Origin, Circulation **4:** 70 (July) 1951.

No evaluation of the results of operation is yet possible, but many things of interest have already been noted. Blood pressure has fallen to normal in a few cases. Recently we had a striking example of a patient with moderately malignant hypertension in whom blood pressure did not fall, indeed rose somewhat, after total adrenalectomy. On the whole, the clinical condition of the patients in whom arterial pressure falls seems improved. Experience indicates that it is useless to operate on patients who are severely nephrosclerotic and azotemic. Just as with pyrogen therapy, there is some relationship between therapeutic effectiveness and adequate renal function. It is important to realize that there is much drama in this operation but many patients do not respond and it would be surprising if they did. Subtotal adrenalectomy appeals to me no more today than it did a decade or more ago.

Total adrenalectomy is purely experimental and should not be done at present with any other aim than further study and then only when the patient can continue under close clinical and laboratory control. He must be intelligent enough to regulate his own adrenal cortical therapy. My experience does not lead me to believe that this operation will ever be widespread as a treatment of hypertension.

DRUGS

Potassium Thiocyanate.—This drug has, in my opinion, one sovereign use: the control of intractable hypertensive headache. It may be given by vein to start with and orally thereafter as used by E. A. Hines. Headache, which has been present for months, often disappears immediately and does not return as long as the thiocyanate level of the blood is kept at from 3 to 6 mg. per 100 cc. The drug has a moderate sedative effect, which accounts for the fact that blood pressure sometimes falls significantly. Its toxic effects have been overemphasized, and are due in most cases to failure of control of the blood level. It must never be used except when the blood levels can be controlled.

Blocking Agents.—Drugs such as tetraethylammonium chloride and pentamethonium iodide (pentamethylenebis [trimethylammonium iodide]) act chiefly by blocking nervous impulses at the autonomic ganglia. Theoretically, they should abolish the sympathetic vasoconstrictor component of vasoconstriction and effect a chemical sympathectomy. Actually, the action of these drugs is much more complicated than this. Chemical sympathectomy certainly occurs, but it is far from complete. To effect adequate blockade, much larger doses are usually required than can be given with comfort or safety, and blockade does not last for more than a few hours. Thus the early hope for tetraethylammonium chloride proved illusory; it has, however, proved to be an extraordinarily interesting drug.

The penta- and hexamethonium salts are considerably more useful.[13] They are easier to handle either given subcutaneously or by mouth, but tolerance to them often develops. Both tetraethylammonium chloride and pentamethonium have several undesirable side reactions, notably interference with gastric motility, constipation, loss of ocular accomodation, dry mouth, and postural hypotension. There is marked individual susceptibility, the minimum dose of pentamethonium required to produce a fall of 40 to 50 mm. Hg. systolic pressure varying from 5 to 150 mg. subcutaneously. Hexamethonium is given by mouth in small doses progressively increased up to 500 mg. from 4 to 6 times a day. Patients on a salt-free diet are believed to be especially sensitive to the drug. Combinations of blocking agents with other hypotensive agents such as 1-hydrazinophthalazine, nitroprusside, or low-salt diets may improve their therapeutic usefulness, but until we know more about their individual action it is probably better to use them singly before combining them in a patient.

Smirk [14] starts treatment with a subcutaneous dose of 15 or 20 mg. three times a day. Each dose may need to be increased by 5 or 10 mg. daily until the desired fall in blood pressure is achieved. After several weeks the dose may have risen to 200 or 250 mg., but then no further increase is usually needed. The effect of the injection should be evaluated about 40 minutes after it was given, with the patient in the sitting posture. These drugs are the way-stations on the long road to adequate chemical sympathectomy.

Substances such as the benzodioxanes which block or reverse the action of epinephrine and norepinephrine at the receptors within the vascular muscle have not proved useful in patients except as a means of recognizing pheochrome tumors. The fascinating chapter concerned with the search for the nature and treatment of these rare tumors must be omitted here because there is no evidence, so far, to suggest that essential hypertension is due to an excess of epinephrine or norepinephrine.

The early promise of dibenamine® (N,N-dibenzyl-beta-chloroethylamine) and its derivatives has not been fulfilled. The action of the benzodioxanes is too transient. 'Regitine" (2-[N-p-tolyl-N-(*m*-hydroxyphenyl)-aminomethyl]-imidazoline hydrochloride) while a rather more effective blocking agent and longer lasting, has not

so far been useful in treating hypertensive patients. It has been of value in controlling paroxysms of hypertension during operations for pheochromocytoma, as shown by Keith Grimson. Best results with blocking agents will be obtained in patients in whom it can be objectively demonstrated that the neurally mediated component of the vasoconstriction is an important one. A discussion of this would, however, take us far afield.

Veratrum Alkaloids.—These drugs are now available in large quantities and in purified form. In the past two years extensive clinical trial has been given these drugs, notably by Krayer, Wilkins, Fries, and others.

The results leave much to be desired. Reduction of average blood pressure of 20 mm. or more systolic occurred in about 15% of our patients. In a few almost normal pressures were reached. The majority were not markedly benefited. This may be due to the fact that the dose eliciting the hypotensive effect of the drug is so close to the toxic one. Vomiting, burning, and constriction of the throat, produced even when the drug is given by rectum, limits the dose. A few of our patients have become partially refractory to the drug after taking it for several months.

Blood pressure may be lowered acutely by giving protoveratrine or "veriloid" intravenously, but this does not have much practical use in the management of most patients. We have not been convinced yet that any of the single alkaloids so far separated are greatly superior to the mixtures. Thus, our current opinion is that veratrum alkaloid mixtures have a usefulness limited to those few patients who respond. The only way to pick these is by trial and error. This is another group of drugs moderately useful in the right patients.

Sodium Nitroprusside.—This drug has been used for wo years in the Research Division of the Cleveland Clinic and will be the subject of a complete report shortly with Drs. Corcoran, Taylor, Bumpus, and Koppanyi. In animals its intravenous injection in minute quantities produces a profound fall in arterial pressure and renal vasodilatation. The fall is not dependent on the nervous system. Nitroprusside does not produce refractoriness or tachyphylaxis in either acute or chronic experiments. So far our results show that the whole ion is necessary for the hypotensive action of the chemical, but over a period of time much of it is converted to thiocyanate and may be determined as such in the blood.

We give initially 30 mg. four times a day of the drug by mouth in capsules, and increase the dose, following the thiocyanate blood level. At present, levels of 12 to a maximum of 20 mg. per 100 cc. of serum seem most satisfactory. At these levels the patients are for the most part without symptoms and significant falls in pressure may be expected. However, the long-term effects of such concentrations have yet to be established and must be viewed with some reserve since it has been repeatedly shown that thiocyanate intoxication often occurs at these levels. We have not seen any tendency in the patients to become tolerant to the drug. If the dose is too high, the patients sleep much of the time, are drowsy, and have poor appetites, and a thiocyanate rash may appear and slight anemia may develop. Mental confusion occurs, especially in patients who show at the outset evidences of deficient cerebral circulation.

Thus nitroprusside cannot be used without control. Our experience suggests that it has some of the properties of thiocyanate, but in addition seems to have a more impressive hypotensive effect though this is as yet unproved. As a hypotensive drug it has the great advantage of being cheap.

In some patients intramuscular crude liver extract and/or vitamin B complex may protect against some of the side-effects. This is still a clinical impression but conviction in it is growing.

We believe it not improbable that part of the hypotensive effect is due to suppresion of the zona glomerulosa of the adrenal cortex. Last year Masson, Corcoran, and I [15] presented evidence implicating this zone of the adrenal glands in the genetic mechanism of some types of hypertension. Recently Davis, Tanturi, and Tarkington [16] demonstrated in dogs, rats, and human beings that thiocyanate causes marked atrophy of the glomerulosal zone.

The whole nitroprusside ion is required for the immediate fall of blood pressure elicited by its intravenous infusion. Thus acute episodes of hypertension may be combated. But the chronic fall in blood pressure seems more dependent on the thiocyanate level of the blood. The patients who received nitroprusside for long periods of time and exhibited marked fall in arterial pressure showed much the same fall when thiocyanate was given by mouth and comparable blood levels reached. In experimental renal hypertensive dogs arterial pressure falls after large doses of nitroprusside and much less so in hypertension of neurogenic origin. It is much more difficult to raise the thiocyanate level of dogs than of man.

1-Hydrazinophthalazine.—Intravenous administration of this substance to cats and rabbits was shown by Gross, Druey, and Meier [17] to lower blood pressure. Renal vasodilatation often results in both man and animals according to Reubi.[18] He also found that, after doses of 10 to 20 mg. intravenously, arterial pressure was either reduced or unchanged in three patients with essential hypertension. Of four patients, two exhibited increased renal blood flow and peripheral perfusion, one increased renal blood flow, and one increased peripheral perfusion only.[19] Thus, renal vasodilatation in patients and fall in arterial pressure were irregular.

Grimson and Chittum [20] showed that the drug lowers arterial pressure in dogs with chronic experimental neurogenic hypertension, but that chronic treatment of patients with hypertension effected no persistent reduction of blood pressure. Chronic oral administration in the hands of Moyer and Handley [21] also was not effective and tolerance apparently developed. Nausea was noted in six patients, vomiting in two, and afebrile reaction with eosinophilia in one. Schroeder [22] has recently had encouraging results with this drug in "neurogenic" hypertensive patients with no effect in renal hypertensive patients. Fries and Finnerty [23] suggest that in man 1-hydrazinophthalazine inhibits sympathetic vasoconstrictor reflexes.

Res., abstracted, Am. J. Med. **7:** 251, 1949. Grimson, K. S.; Chittum, J. R., and Metcalf, B. H.: Action of 1-Hydrazino Phthalazine (C-5968) on Vasomotor Reflexes and Hypertension in Dogs and Man, Federation Proc. **9:** 279, 1950.

Our interest in this substance was stimulated by the demonstration that it could block the action of a pressor substance liberated from the brain as a result of afferent stimulation. My associates and I [24] found that its action seemed enhanced by tetraethylammonium chloride and was abolished by 1-hydrazinophthalazine. Since the action of serotonin—probably a 5-hydroxytryptamine—is also partially inhibited by this drug, there might be some relation between the humoral vasoconstrictor of cerebral origin and the hydroxytryptamines. Tryptamine itself is also almost wholly reversed from pressor to depressor. Phthalazine is ineffective in suppressing the actions of epinephrine, norepinephrine, beta-hypophamine (pitressin®), barium chloride, acetylcholine, renin, and angiotonin.

Given intramuscularly in a dose of 2 mg. per kilogram of body weight, 1-hydrazinophthalazine regularly lowers pressure of both neurogenic and renal hypertensive dogs to normal levels for periods averaging from four to six hours, tending to be more prolonged in the neurogenic hypertensive animals. The fall in blood pressure is much less sharp and deep in normal and renal hypertensive animals than in the neurogenic hypertensive when given intravenously. The fact that the fall occurs only after a latent period, and then only slowly, suggests the conversion into some other active substance within the body.

Our experience with this drug was encouraging with a group of hospitalized patients with malignant hypertension and those with essential hypertension treated as outpatients. Of 70 patients, 5 were unable to take the drug. Thirty-three had a fall of 20 or more mm. Hg diastolic pressure, 14 equivocal fall, and 17 had none. In some patients, blood pressure fell to normal, but this was not usual. The dose ranged from 100 mg. to 1.4 gm. daily. Good responses have eventually occurred in patients who had no lowering of pressure during the first 10 days of treatment. The malignant syndrome has been clearly reversed in several patients, much to our surprise.

Marked orthostasis appears promptly after starting administration of the drug and precedes by some time fall in the average lying blood pressure. Headache ocurred initially in 42% of the patients who took the drug nd disappeared spontaneously in 70%. Nausea apeared in 18%, and vomiting in 12%. These may usually overcome by decreasing the dosage, but diphenhydrane given simultaneously has provided more prompt ief. Diphenhydramine may, however, interfere with hypotensive effectiveness of the drug.

MIXED TREATMENTS

For therapeutic purposes alone we favor mixed treatent of hypertension; low-salt diet with hexamethonium, drazinophthalazine plus hexamethonium, nitroprusle plus sympathectomy, and so on. The understanding and rational use of a variety of drugs attacking the disease at multiple points could be more effective than the exclusive use of one drug. I would point out, however, the necessity of most careful evaluation of the individual drugs before combinations are created. Perhaps the most dismal period in commercial drug promotion is that in which one new ingredient after another is added as competition increases and sales fall off.

In practice, it would seem wise to start with one measure at a time, adding on others as needed. At last the physician has a group of remedies from which to choose.

URINARY INFECTIONS

It may seem gratuitous to mention the importance of rigid control of urinary infections, but with antibiotics the results are so good that it is a pity to allow infections to progress to the point of irreparable renal damage. We have been repeatedly impressed by the fact that the mere control of renal infection greatly benefits the patient and reduces his blood pressure. The syndrome of malignant hypertension has even reversed itself. Though this is rare, its occurrence dramatically illustrates the part infected renal tissue may play in the genesis of hypertension.

We believe that cystitis and other forms of urinary infections should be vigorously treated. This may be especially desirable in young women and may prevent renal hypertension from developing later in life. Abacterial pyuria is probably an indication for treatment with the newer antibiotics.

It is difficult to diagnose chronic pyelonephritis, especially when it is not very active. We used repeated urine cultures, the urine red and white blood cell count in the Addis test, and retrograde and intravenous pyelography. Unfortunately, the pattern in pyelonephritis associated with hypertension is almost the same as that in established essential hypertension.[25] Except as they indicate how advanced the process is in destroying renal tissue, functional tests do not aid in diagnosis.

TREATMENT OF MALIGNANT HYPERTENSION

The treatment of the malignant phase of essential hypertension offers a peculiarly elusive problem because within a few weeks or months the disease may progress from a stage which might have been reversible to one surely terminal. Resolute and prompt decisions are vital. But treatment should not be undertaken until the diagnosis and the rate of progress have been determined.

For practical purposes we use the changes in the eyegrounds, the changing functions of the heart, the Addis tests, and the iodopyracet (diodrast®) or paraaminohippurate clearance, and the maximum tubular excretory capacity as criteria for determining the extent, degree, and rate of change of the vascular disease.

25. Corcoran, A. C.; Taylor, R. D., and Page, I. H.: Functional Patterns in Renal Disease, Ann. Int. Med. 28:560, 1948.

If the disease has not progressed too far, and this is a matter that I have discussed elsewhere,[25a] four choices are open for treatment. The first is diet, drastic low-sodium diet (potato, low-sodium milk, salt-free oleomargarine) or rice. This is the simplest, but it may be remembered that only about one-quarter of the patients with essential hypertension respond to low-salt diets, and many of these patients respond too slowly to reverse a rapidly progressive malignant syndrome. Since there is no way short of trial to pick the "salt responder," six weeks or several months of precious time may have been lost and with them the possibility of other therapeutic trials. But when the vascular disease is not advancing rapidly, diet should be tried with reasonable anticipation of some success. The daily sodium content of the diet should be 200 mg. or less; if there is azotemia, it should also be low in protein.

The second possibility is lumbodorsal sympathectomy. The late Dr. George Heuer and I found in 1934, before indications and contraindications had been suggested for sympathectomy, that the malignant syndrome not infrequently regressed or disappeared after sympathectomy. The good results lasted from several months to five years, but after that all of the group were dead. We concluded then that sympathectomy was the best, because it was the only treatment for the condition at that time. However, at present, we limit its use in malignant hypertension to young patients very early in the disease if it is to be done at all.

The third choice is pyrogen therapy. Our use of pyrogen began a number of years ago with the injection of kidney extracts. These extracts were sometimes very effective in the treatment of malignant hypertension. The uestion arose as to whether the results obtained were used by some specific hypotensive substance in the extract or by the pyrogenic actions elicited by its injection. With Taylor and Corcoran,[26] it was possible to show that planned treatment with a variety of pyrogens definitely reversed the hemorrhagic arteriolitis in many patients with malignant hypertension. This is an important offshoot of our work on kidney extract. In my opinion, not all of the results of kidney extract are explicable on this basis. While this view is not shared by others, there are effects from these extracts which do not seem caused by pyrogen alone. Only further work can decide this.

We employ a soluble bacterial pyrogen (pyromen®-[Baxter]) and give it as an infusion in 200 cc. of saline in sufficient amounts to raise the temperature daily to 101 or 102 F. Thereafter, the amount given is determined by the temperature response of the previous day. Tolerance to the pyrogen unfortunately often develops, and after several weeks very large amounts of it may be necessary. If the amount required becomes unreasonable, then a rest period of three to five days is given and treatment again resumed at a quarter of the last dose. In other patients a dose range which consistently gives a good response may be found and, more important, it does not vary from day to day or month to month. The details of treatment have been given elsewhere.[26] If necessary, patients reactions to the pyrogen may be lessened by preliminary intravenous injections of amobarbital (0.2 gm.) and mephenesin (tolserol®) (0.5 gm.) given into the tubing of the infusion set. Unless very dilute, mephenesin will cause thrombosis of the veins.

About the only necessary criterion for selection is that renal function not be excessively low (not less than 50% of normal urea clearance; the maximum tubular excretory capacity using paraaminohippurate was 30 mg. or more; maximum ability to concentrate urine to a specific gravity 1:020 or greater). If renal function is severely impaired, the effect only subjects the patient unnecessary discomfort. The benefit will be transient least, or the progress to uremia somewhat slowed.

A few things about this treatment need emphasis. is a harsh treatment, but malignant hypertension is mo than harsh—it is lethal. Treatment is given six days the week and must be prolonged until the patient r ceives no further benefit. This usually means three four months.

The fact that most patients believe malignant hype tension is a relatively insignificant episode which shou be curable in a week or so is deplorable. They seem u able to grasp its dangers, hence are unwilling to make t sacrifices they would gladly make were they victims cancer or tuberculosis. It is well, therefore, to outli carefully the situation with the patient before treatm is undertaken. Our greatest tragedies have been in p sons who have improved greatly, then broken off tre ment in the middle only to relapse into a state in wh treatment could not be resumed. Realization comes late.

The results have in many cases been impressi Within several weeks the eyegrounds will have clear Blood pressure falls, but this may be much slower tl the improvement of the eyegrounds. Heart size may a diminish and renal function improve.

After discontinuing treatment, arterial pressure r rise almost to its pretreatment level; but, now, a several years, the malignant syndrome has not retur to our patients.

Comparing the results we have obtained with s pathectomy over a period of 17 years and with die management for six years, it is my current opinion pyrogen is the treatment of choice. Let me empha that malignant hypertension is for the most part a dangerous disease, and in its management one must and act quickly and resolutely. Treatment should continued until a result of one sort or another is cert Malignant hypertension is like a grass fire in a wind.

SUMMARY

Current treatment of essential and malignant hy tension has been briefly reviewed. The results justify hope that these diseases may eventually be curable that even today much can be done for their victims. only by the use of every reasonable weapon, diagno and therapeutic, that good results may be expected management of this multifaceted disease.

MANPOWER PROSPECTS WITHIN THE POPULATION STRUCTURE

C. J. Velz, M.S.P.H., Ann Arbor, Mich.

With the role of world leadership thrust on the United States, it is academic to ask whether we shall employ older people in industry. The practical question is: What are the manpower prospects within the population structure and how can we most intelligently utilize our limited human resources? Whether the war be cold or hot, increasing civil needs, the Point Four Program, and rearming the free peoples of the world are placing and will continue to place a prodigious demand on our production capacity. Any one would be sufficient to strain our foreseeable resources; the three in combination will require that we employ all manpower available, young and old, and that we use it more intelligently than in the past.

Five basic factors are at play tending to restrict manpower resources:

1. The population of the United States has reached a transition point in growth and is rounding off to a saturation level.

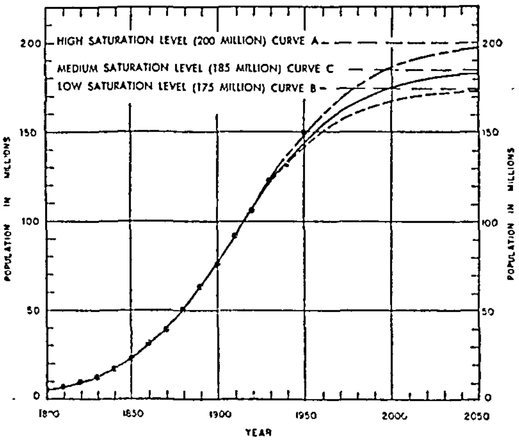

Fig. 1.—Logistic population growth of the United States from 1800 to 2050.

2. Part of our population growth is resulting from increased longevity rather than addition of new young stock.

3. The internal structure of our population is shifting toward an increasingly greater proportion of older people.

4. The trend is toward a smaller proportion of males in the population.

5. Governmental and industrial policies have tended to increase the gap between biological-life and working-life, with consequent inefficient utilization of manpower.

A brief discussion of these factors establishes a basic framework for viewing the problem of aging in relation to industry.

SATURATION LEVEL OF POPULATION

Figure 1 shows the growth curve of the United States from 1800 to 1950 with logistic forecast to the year 2000. Three forecasts are indicated: Curve A, a high saturation at 200 million based on a combination of socioeconomic factors continuing favorable to growth; Curve B, a low saturation at 175 million, based upon a combination of unfavorable factors; and Curve C, a medium or most probable saturation value of 185 million. These saturation levels are not predicated on arbitrary assumption as to immigration, fertility, or death rates; they are derived from the basic characteristics clearly defined in the past record of growth. The United States as a whole, as well as the 48 individual states and the major cities, are well past middle age and are rapidly approaching population saturation. After the phenomenal growth of the past 150 years, it is difficult to realize that the United States is no longer a young country. As of 1950, it is about 80% old with only 20% to grow to saturation level. And furthermore, the United States with a coefficient of growth of 0.6 is growing around an "S" curve at a pitch twice as steep as the rest of the world.[1]

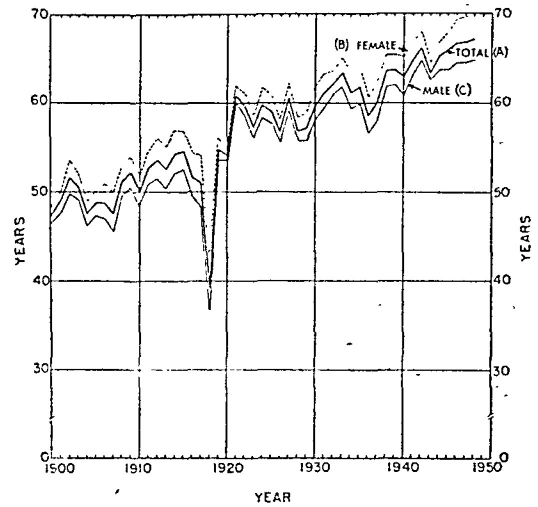

Fig. 2.—Average length of life. Total population and death registration of the United States from 1900 to 1948 (after Greville and Carlson).

INCREASED LONGEVITY

Not only is population in the United States experiencing a decreasing rate of increase, but much of the recent growth has been due to increased longevity associated with the advances in medical knowledge and public health practice. Figure 2 shows the trend in average length of life (expectation of life at birth) as estimated by the National Office of Vital Statistics[2] based on the mortality of each calendar year from 1900 to 1948. Curve A is the expectation for the total population and Curves C and B differentiate between males and females. While there is considerable fluctuation from year to year, the upward trend is unmistakable, ranging from about 48 years for the total population at the turn of the century

and increasing to 67.2 years for 1948. The expectation of females exceeds that of the males by three to five years, with the recent trend toward increasing the differential. The influence of the devastating influenza epidemic of 1918 is pronounced.

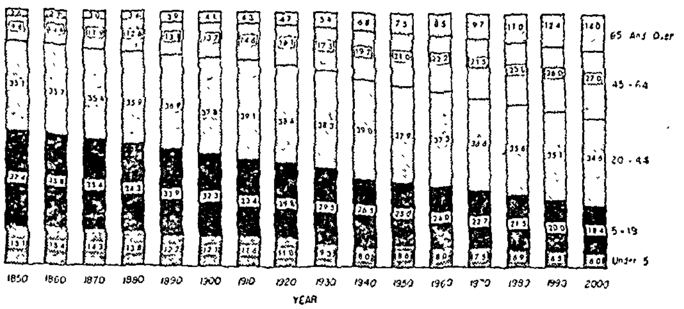

Fig. 3.—United States age distribution (per cent of total population) from 1850 to 2000.

GREATER PROPORTION OF OLDER PEOPLE

It is *inevitable that, with the trend toward decreasing* rate of increase in the total population and the increasing expectation of life, the United States population structure *must show a greater proportion of persons in the older age groups. Declining birth and death rates and immigra*tion restrictions are evidenced by a smaller and smaller proportion of young stock *in the population, with a shift* toward a larger and larger proportion of people in the older age groups. This is strikingly evident in Figure 3, *which shows the percentage of the population for each* census decade in the broad age groups, 5 years and under; 5 to 19 years; 20 to 44; 45 to 64; and 65 and over. The numbers in each age group are expressed as a percentage of the total population of each of the respective census years 1850 to 1940. The forecast to the year 2000 has been based on logistic characteristics of the total population, taking into consideration the dynamics of socioeconomic opportunity reflected in the past growth, *and was not restricted by arbitrary assumptions as to* immigration, fertility, and mortality. It will be observed that the middle age group, 20 to 44, remains reasonably stable, but the two younger age groups decline while the two older age groups showed marked increases. In 1850, 15.1% of the population was 5 years or under, and 37.4%, 5 to 19 years. These percentages declined to 8% and 26.5%, respectively, in 1940, and the forecast indicates that by the year 2000 the decline will continue to 6% for the 5 years and under group and 18.4% i the 5 to 19 years age group. On the other hand, the percentages of the two older age groups—45 to 64, and 6 and over—in 1850 were 9.8% and 2.6%, respectively. These increased by 1940 to 19.7% and 6.8%, respectively, and the forecast for the year 2000 shows the 45 to 64 age group increasing to 27%, and the 65 and ov group to 14.0%. In 1850, 52.5% of the population wa 19 or under, while only 12.4% was 45 and over. In 194 this shifted to 34.5% *in the 19 and under* group, while th age group 45 and over increased to 26.5%, and the forecast to the year 2000 shows about 25% of the population 19 years and under, with a *marked increase* in the older age group 45 and over to about 41%. These ar significant shifts in the *internal structure* of our population.

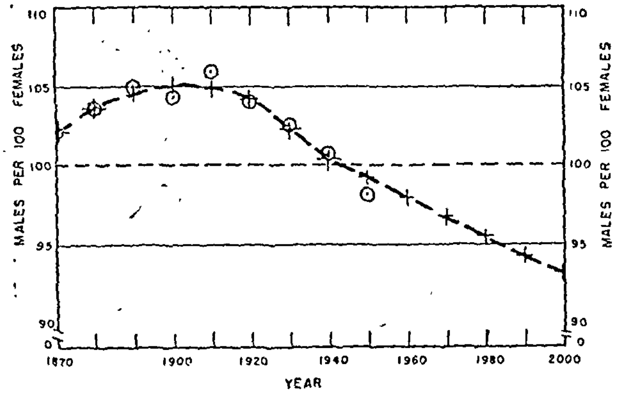

Fig. 4.—Sex ratio of males to females in total United States population from 1870 to 2000.

SMALLER PROPORTION OF MALES

Another internal shift in population structure which has a bearing on the manpower situation is the declin in the proportion of males in the population. For the first time in our history, the census in 1950 reports more females than males in the United States. Figure 4 shows the sex ratio, males to females, in the total population for the census years 1870 to 1950, with a forecast to 2000. In the early years males outnumbered the female but there has been a gradual trend toward the revers

This is the over-all picture of the prospects concernin *the potential labor force within the population structure of the nation, and it is within this framework that w must view the problem of aging as it affects industr While our production goals are pointing upward, o available resources are growing more restricted. Th basic question then becomes:* How can we most efficient utilize our limited labor resources?

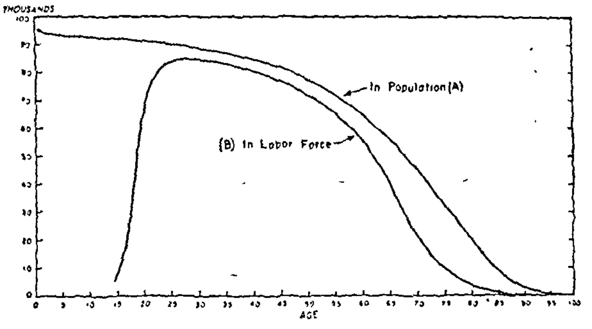

Fig. 5.—Stationary population and labor force; total number of male 1940. Number living, of 100,000 born alive (United States Departme of Labor, Bureau of Labor Statistics).

INEFFICIENT UTILIZATION OF MANPOWER

A recent study made by the Bureau of Labor Statistics affords an opportunity to appraise the efficiency of th utilization of manpower in industry. Figure 5 presen graphically a comparison between biological-life ar working-life, based on mortality rates and the accessi and separation practices from the labor force which pr vailed as of 1940. Curve A shows the number of perso living of 100,000 born alive in the population at any ag This is based upon 1940 mortality rates and represen stationary population. Curve B shows the number of m in the stationary population, who are in the labor for in each year of age under conditions of labor force participation similar to those prevailing in the United States in 1940. The labor force is that defined by the Bure

---

3. Tables of Working Life: Length of Working Life for Men, Bull. No. 1001, Labor Statistics Bureau, 1950.

of Census [4] and, in general, includes all persons 14 years of age or over (not in institutions) who are employed or who are seeking work, including members of the Armed Forces. It will be observed from Curve B that there is a sharp accession to the labor force in the late teens and early twenties, reaching a maximum participation in the late twenties, with about 85,000 of the 90,000 survivors participating, or approximately a 95% utilization. In the middle years of life, it will be seen that the labor force parallels the biological population curve up to the mid-50's with a differential between the two groups of 5,000 to 7,000. However, since the number remaining alive is declining, percentagewise the efficiency of utilization of manpower declines. The gap between the two curves, of course, also reflects those males unable to work or confined to institutions. But, unfortunately, after the mid-50's, the labor force curve declines sharply either by enforced or voluntary retirement and the gap between the two curves widens, indicating an inefficient utilization of manpower. At age 55, 90% of the available manpower is in the labor force, dropping sharply to 67% at age 65, and at age 75 to less than 30%.

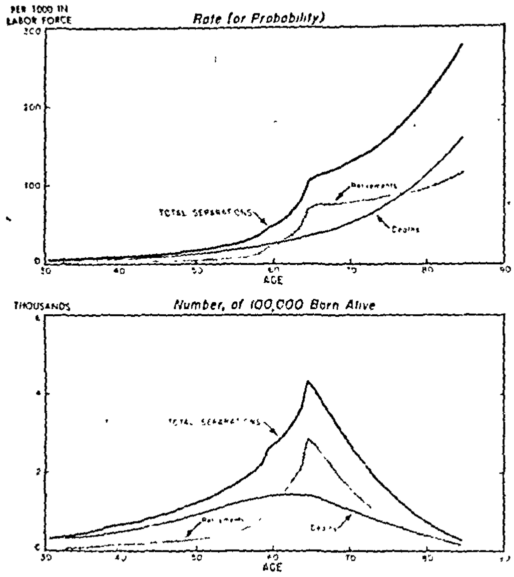

Fig. 6.—Annual labor force separations due to death and retirement; total number of males. 1940 (United States Department of Labor. Bureau of Labor Statistics).

As further illustration of inefficient utilization of manpower in the older ages, Figure 6 shows the annual rate of separation from the labor force due to death and retirement. Separations due to retirement, as distinct from death, cover all other withdrawals, disability. old age, eligibility for pensions, prolonged unemployment, or other factors. Between the ages 14 to 31, separations from the labor force are practically entirely by death; for ages 32 and over, the total separations are distinguished between those occurring by death and those by retirement. It will be noted that the biological separations from the labor force by death form a smooth, easy rising curve, while separations by retirement show a sudden, sharp rise commencing in the late 50's, with a maximum rate of 70 per thousand by age 64-65. Retirement rate rises after age 65, but at a much slower rate. The sharp characteristics of retirement practices reflect arbitrary governmental and industrial practices, but not necessarily inability of people at these ages to perform useful work.

Another interesting measure of the efficiency of utilization of manpower is illustrated in Figure 7, based on 1940 conditions of mortality and separation. The "Life" curve measures the average number of years of life or the average biological-life expectancy of men at a given exact age. The curve designated "In Labor Force" represents the average number of years remaining in the labor force, or working-life expectancy. The difference in years between these curves indicates the gap between "biological-life" and "working-life" expectancies and, as such, measures efficiency of utilization of manpower. A young man on his 21st birthday could expect to live an additional 46 years, or to age 67, but he could expect to remain in the labor force only an additional 40 years, or until age 61. He could anticipate a gap of about 5 years between his biological-life and his working-life. The gap remains about the same, increasing to about 6 years at age 60, and thereafter the gap closes for those few who remain in the harness to the end of life.

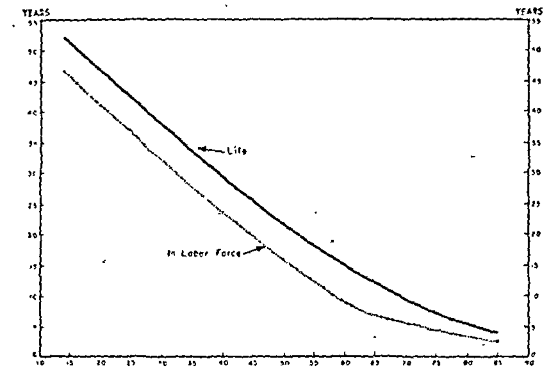

Fig. 7.—Average number of remaining years of life and of labor force participation among male workers, 1940 (United States Department of Labor, Bureau of Labor Statistics).

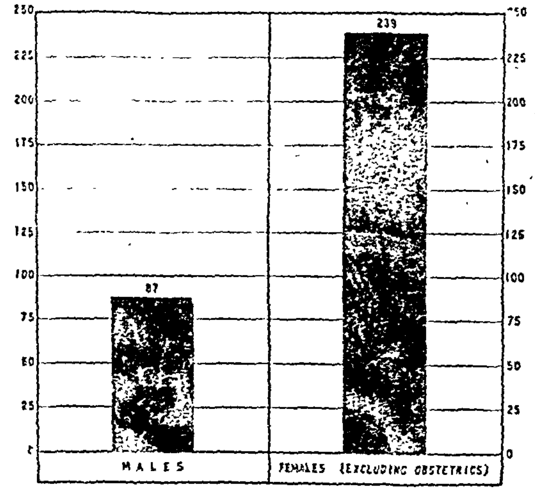

Fig. 8.—Sickness frequency rates per 1,000 hourly employees by sex. Data are based on 14,000 and 14,500 Group Insurance Program claims closed through December, 1950, beginning in the 12-month period ended July 31, 1950.

In our enthusiasm over utilization of the older man, we should not fail to realize the great loss in man-years of productive capacity occasioned by accident or poor health, forcing a young man with a high life expectancy to be separated early in life from the labor force. Good community and industrial health practice can make a great contribution here, not only in preventing separation from the labor force but in preventing the current loss of man-days due to illness and accidents. A total of 40 million [5] man-days was reported as lost time in industry due to accidents alone in 1950.

---

[4] 16th Census of Population or Census Bureau's Monthly Report on Labor Force.

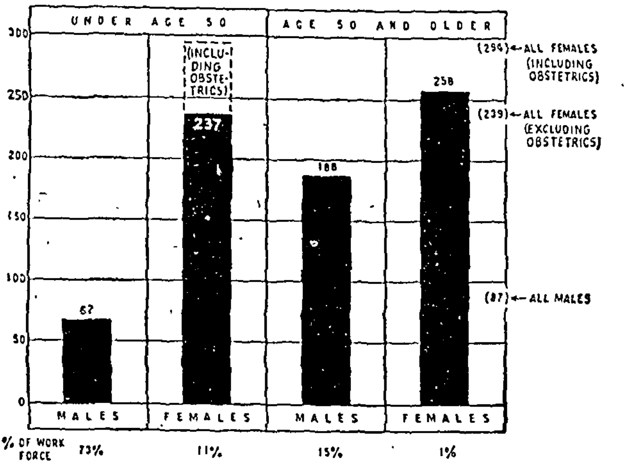

Fig. 9.—Sickness frequency rates per 1,000 hourly employees by sex and age: data are based on 14,000 and 14,500 Group Insurance Program claims closed through December, 1950, beginning in the 12-month period ended July 31, 1950.

Thus far discussion has centered on utilization of men. There remains a reservoir of womanpower which cannot be overlooked. Some indication of the health aspect associated with employing women is obtained from a recent report,[6] "Non-Occupational Disability in General Motors," based on claims filed by employees for sickness and accident benefits under the General Motors Group Insurance Program. The total time lost from work because of nonoccupational disabilities which lasted more an seven days amounts to over 3¼ million days per ar. for General Motors, equivalent to a labor force to operate the entire Cadillac Motor Car Division for a full year. This is nonoccupational disability, emphasizing the importance of not only industrial health but community health as well. Of special interest is the marked difference between male and female employees, as illustrated i Figures 8, 9, 10, and 11. In the course of a year, 87 mal employees out of 1,000 have a nonoccupational sicknes lasting more than seven days. The over-all female rate, (Fig. 8) is 239 out of 1,000 (excluding obstetrics) o three times more than males; the young female (unde 50) rate (Fig. 9) is 4 times that of the males.

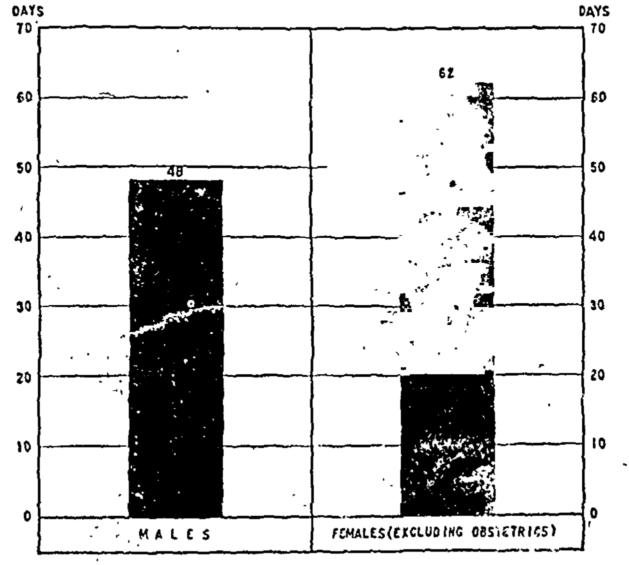

Fig. 10.—Average duration of sicknesses among hourly employees by sex: data are based on 14,000 and 14,500 Group Insurance Program claims closed through December, 1950, beginning in the 12-month period ended July 31, 1950.

Not only in frequency of sickness but also in duration (Fig. 10 and 11) the female employees exceed the male. While the female employee is out an average of 62 days, the male employee is out an average of 48 days.

This should suffice to indicate that there is no easy solution to the problem of adequate efficient labor force either we reach upward into the older age group of me or we utilize a larger proportion of women, or both.

COMMENT

The consequences need not be as dark as is reflecte by current statistics. Some of the poor showing reporte for older men and for women is not necessarily inhere in these sources of labor force; rather it is in part, o failure to differentiate and delineate the capacities an limitations of the individual, whether male or female.

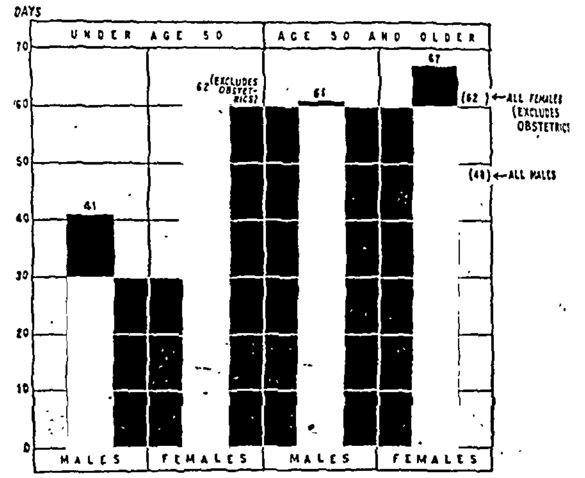

Fig. 11.—Average duration of sicknesses among hourly employee sex and age: data are based on 14,000 and 14,500 Group Insurance gram claims closed through December, 1950, beginning in the 12-m period ended July 31, 1950.

It is a well-recognized principle in tooling of indus that it does not pay to use a chisel as a screw driver. it is expected that any human can do any job as efficie as any other. There are too many "human chisels" be employed as screw drivers and that is why some of statistics look so bad. When industry puts the right or woman on the right job, a tremendous improvem in efficiency will result. There is evidence of the vali of this in recent industrial practice. At Dodge Divisio Chrysler Corporation,[7] where an effort was and is be made to fit the job to the man; in a quality control rep a division of old men and handicapped rated near the with rejects less than 1% compared with 2% in other departments, and accidents at a minimum.

CONCLUSION

The facts are clear; our labor force is quite limited a whether we like it or not, pressures of production require reorientation to greater use of older men and a women. Industry has been brilliant in mechanical tooli The challenge is to apply the same brains to "hum tooling."

School of Public Health, University of Michigan.

TRAINING THE OVERAGE EMPLOYEE FOR RETIREMENT

Phil N. Scheid, B.A.Sc., Chicago

All competent speech instructors advise the neophyte to commence his address with some sort of a shocking statement; he should say something unusual about the usual. In this instance the title of this address in itself has a sufficiently shocking effect on the average member of the industrial management family to render any further treatment unnecessary. His most likely comment is "Why should industry undertake the expense and effort of a training program for the benefit of an employee who is about to be retired?" and he most logically argues that any further benefits paid for from productive earnings would be fostering the trend toward industrial socialism. Another comment might be "Why does a man have to be trained to rest?" although there is a growing recognition of the fact that preparation is necessary against the day when only the personal problems remain for thought and worry—when most time becomes leisure time.

Isn't it sufficient that many heavy manufacturers have now agreed to underwrite the expense of noncontributory retirement and pension programs, extended vacation benefits, liberalized sick benefits, and many additional so-called fringe items that in no way can be correlated with the individual's productive output?

The past five years have seen an increasing growth in the expense of these fringe costs. The 1950 cost of fringe benefits in one of our largest steel corporations was eight times as great as the fringe cost of 1936. The reluctance of business can, therefore, be understood when the subject of training for retirement is introduced. In contrast, however, the increasing general interest in "employee benefit" programs may explain why some efforts are being made by business concerns to undertake the problem of preparing the overage worker for retirement.

RETIREMENT PREPARATION PROGRAMS

Possibly in smaller communities, the "public relations" value of "doing something" for the retired employee is of sufficient import to a company to warrant the establishment of a retirement preparation program. Other business organizations, which have already committed themselves to assist retired employees through the installation of various types of benefit plans, feel that they are morally bound to extend further their interest in the form of retirement preparation programs.

Inasmuch as several such programs are in operation, we can surmise that some business organizations have accepted the responsibility for preparing employees for retirement.

We might arbitrarily classify these programs into two groups: "postseparation" and "preseparation." By way of definition, the postseparation programs are those which attempt to provide the retired employee with some useful worthwhile activity once his employment relationship is disconnected. Preseparation programs are those of an introductory nature which manifest themselves in the form of conferences or individual consultations or arrangements with prospective retirees prior to employment separation.

Postseparation Programs.—Let us first examine a postseparation program. One such program is that of the Mohawk Development Service. This is an independent concern consisting primarily of retired employees of one of the larger electric corporations. It is an independent group working in the field of electrical engineering design. It is understood that this program is not corporation sponsored, but it certainly bears watching by the larger companies as an experimental project.

Preseparation Programs.—Preseparation programs are by far the more numerous. Typical among these is the recently inaugurated "step down" retirement plan of Wrigley Corporation. On attainment of normal retirement age, the employee is granted a one-month leave of absence without pay. During the following year he is granted a two-month leave of absence without pay, and this leave period is thereafter expanded until he had gradually adjusted himself to his retired status through a gradual diminishing of active employment periods.

Another such program is that of the Ithaca Gun Company of Ithaca, New York. It is probably unfair to refer to this activity at Ithaca as a retirement program inasmuch as employees are allowed to continue working as long as they are qualified to perform their work assignments. At Ithaca, employees are retained on the active payroll beyond what is generally referred to as the normal retirement age.

These cases indicate extreme examples of the trend in industrial thinking toward adjustment programs for retired or overage employees.

For our purposes we may further subdivide preseparation programs into "group type" programs and "individual consultation" programs.

Group Type: Typical of the group-type preseparation programs is the work done by Esso Standard Oil Company. Sometime prior to retirement, the group of employees is organized in a series of five sessions, each of one hour in duration.

The following topics are covered: What is Retirement? Retirement and Your Health, Planning Your Retirement, What Have Others Done, and finally, a Round Table of Plans.

Where financial problems must be solved, individual conferences are arranged with personnel counselors. Probably Esso is farthest advanced in the field of group programs for retired employees. The main feature of the Esso program is the sharing of personal plans and ideas

The school system must adjust to a gradually decreasing number of young folks. Simultaneously it must adapt its curriculum to prepare pupils for a lifetime at least a third or a half longer than that for which students were once prepared. It is imperative that courses for adults be given the place in any community's system of education which the size of the adult population deserves. The social services, which in line with the general cultural pattern have placed their major emphasis on youth, must soon begin to include in their consciousness and in their programs meeting the needs of aging persons as individuals or as members of a family group. Only by more scientific study of the young and the old and the relation of one to the other will better and more useful data for the guidance of each be developed. Family agencies must discover what effect the presence or the absence of older people in the family has on the family. Especially is this indicated since in spite of the seeming instability of the family we are still led to believe it is the place most conducive to the maintenance of emotional and mental balance for the general run of individuals of any age. Census figures would lead us to the conclusion that all social institutions must adapt their services to communities with more single elderly individuals in them—especially single women—who are outliving and outnumbering the men in the upper age brackets. In other words, all professional personnel who share the common goal of helping individuals to realize to the fullest their capacities for living have had placed on them a new and inescapable responsibility for divesting themselves of the prejudices to which they are naturally heir as to aging and old age, of their resistance to an appreciation of the positive elements in an older person's situation and in his personality, of their understandable tendency to concentrate efforts upon the young. Only if this happens can the stereotype, which has so firmly fastened a strangle-hold on our minds and our emotions, be thoroughly shattered and a new prototype set for old age in the coming decades.

With the rapid march of business and industrial organization and the concurrent drive for improved working conditions, the dividend of more leisure time has accrued to all members of society. This presents the country with a challenging paradox. The concerted efforts to achieve shorter working days and weeks by the younger segment of the population, or by those in the active labor force, have been counterbalanced, on the other hand, by the intense dissatisfaction of many oldsters who find themselves committed, willy-nilly, to a life of leisure and, for far too many, one of idleness and utter boredom. This reallocation of time invests it for some with real value, and for others robs it of all value. Hence there is for the first time the phenomenon now engaging the attention of many communities, local, state and national, of idle hands and minds belonging to thousands of unemployed not regarded as of the labor market, for in it are the roots of the Townsend and other old age movements led by opportunistic demagogues. One antidote to these is the organization of "golden age" clubs, which appear at first blush to be very superficial, but which if provided with professional leadership, endowed with a seriousness of purpose, and correlated with sound adult educational programs and with those of religious groups, can be genuinely useful in giving older people the thrill and excitement of creative activity and the essential feeling of belonging. While such activity may serve in lieu of gainful employment, it also serves simultaneously as a brake on the less constructive use to which the organized groups of people, *with time on their hands* in the later decades, have been put. Beyond this, it also serves as a means of the possible prevention or retardation of the alarming movement of persons 60 and over into the hospitals for the mentally ill—an expensive drain on the state for care that is inappropriate and is actually required, at least on first admission, by relatively few persons.

One other striking sociological aspect of our agin population directly related to the oversupply of enforce leisure, as well as that which is welcome, is to be see by anyone who looks. That is the movement of the olde people whom we have so successfully fractionated fro the rest of the community to warmer climes and to plac where living promises to be easier and cheaper. Such movement can result not only in leaving abandoned far and ghost towns in New England and the Middlewes but also in developing a new kind of boom town in t South and West, in which the average age will be in t seventies and the average income will not be hi but fairly regular. Not only will this movement entail revision of civic government and services in the tow the oldsters have left behind them and in the towns which they have descended to settle anew in their age, but this inevitably will affect reapportionment representation on the basis of the voting population the respective areas. It has been said by men wise in political sciences that older people do not change th political loyalties. If this be so, the political activit of different parts of the country may be tinged if colored by the admixture of sizable numbers of vot from elsewhere, and the home state too will sense shift of power by its losses. It may therefore be the p of wisdom and sound strategy to study the theoreti projections as to the direction of the treks of a people w have the habit of travel and also have the leisure w which to indulge that habit. Services or housing app priate to their changing needs may then be plan with a greater probability of their suitability and locati Such study might demonstrate that, if life in the ho town could be made more tolerable and enjoyable, t is where they would likely prefer to keep the perman home base.

CONCLUSION

The sociological changes occasioned by the aging the population are many. They cut deep into the so pattern of every community. The response of society such changes notably lags behind the recognized indi tions for action. The coming decade will be a critical for older people and for society as a whole. The f stirring of an awakened country, now reflected in cussion and openly expressed concern as to the ag population, must soon be converted into positive acti It is inconceivable that the American people once arous will not work out the desired integration of its aging a aged citizens, for on this is dependent their own ultima salvation. The words of Lloyd George, "The true t of our civilization is in the way we treat our old peopl have significance for us today as never before.

AN ORIENTATION OF THE PROBLEMS OF AGING

Robert A. Moore, M.D., St. Louis

The problem which is before all people in the United States in general, and before gerontologists in particular, may be stated in a simple question: What adjustments should and must be made in our society to meet the changing proportions of age groups in our population? The answer to the question is not simple because the solution of the problem, and consequently the adjustments, will touch on every facet of our social and economic life.

WHAT GERONTOLOGY IS

Gerontology, the study of the aging processes, is not a discipline of concern chiefly or even primarily to the gerontologist. In fact, I believe we would make more progress if we recognize once and for all that gerontology nt prac separable and distinct area of knowledge and ac- pool and her, it is a subspecialty of every other branch r will be faced w ply this concept to medicine, that is to to all other areas. Thus, there may s, geriatric surgeons, and geriatric iatricians who cover the entire field tunately, a group of internists inter- f the aged have come to be looked e geriatrists, when in fact most of them to deny this and would call themselves . A minority in favor of a separate nalogy with pediatrics, forgetting that the present day pediatrician is in fact a pediatric internist who calls in consultation the surgeon, the urologist, the otolaryngologist, and others.

On the other hand, I would equally defend the formation of societies of gerontology and of geriatrics, if for no other reason than I would be a hypocrite if I did not, since I was one of the incorporators of the Gerontological Society. The value of societies and meetings of those interested in aging and the aged is not to separate the members and attendants from other groups, but to bring together individuals from many different groups in a joint study of mutual problems.

Thus, I would make as my first point in what our chairman has graciously called "orientation," that gerontology is not a science or a discipline in the usual sense, but is interdisciplinary in its scope. With this concept no one is only a gerontologist or a geriatrist.

PROBLEMS OF GERONTOLOGY

With that as a starting point let us proceed to examine some of the more important problems of gerontology. Manifestly it is impossible in a short time to discuss any one more than briefly. It is apparent that my selection of topics and my discussion of them will be colored by the fact that I am first, a physician; second, a pathologist; and third, a dean.

Need for Knowledge of Aging Processes.—I would consider as most important the need for greater knowledge of the nature of the processes of aging, i. e., the biochemical and biophysical processes that occur as protoplasm ages.

Let us approach this problem in the same way we have attacked the problem of the infectious diseases. The morbidity and mortality from the infectious diseases were not brought down by starting with an attempt to treat each of them specifically. Public health and preventive medicine today rest on 70 years of careful basic laboratory study of the growth characteristics of bacteria and viruses, and the reaction of tissues and cells to them.

In these fundamental investigations we should not place too restricted a definition on gerontology. Most people associate the term with the higher groups of chronologic age, with man or at the most mammals, and with biology. Much of value will be lost if this concept is accepted.

First, aging may be studied at any chronologic age in certain tissues and cells. For example, Heuser's membrane appears, does something, and disappears during the first 10 days of human gestation. Or, the ductus arteriosus undergoes involution in the first two months after birth. Or, the thymus begins to involute after puberty. Or, the healing of a wound at any age reproduces the cycle of life with proliferation of fibroblasts, deposit of collagen, and maturation of the scar. A precise study of the conversion of fibroblasts to fibrocytes, the maturation of collagen, and the hyalinization of connective tissue in an animal of any age might give real information on age changes in connective tissues, one of the more significant and important fields of study.

Second, aging is not restricted to man or to mammals, but occurs in all forms of life and in some inanimate objects. In fact, by analogy with other fields where progress has been made, investigation in the lower forms is simpler because of better control and fewer unknown factors. A study of the aging of crystals or of metals may well have a bearing on aging of protoplasm.

Third, aging is not a process which is entirely biological in a physical and chemical sense, but is a process with psychological and sociological aspects. These approaches must be studied independently and in cooperation with the biological. Our objective is not only "to add years to life," but also "to add life to years." What have we gained if we keep people alive but devoid of the joy and satisfaction of life. I believe that, with energy and imagination, we can some day define and study mental and social factors as precisely as today we study chemistry. Need I say any more along the line of fundamental studies to illustrate my basic thesis that gerontology is interdisciplinary in scope and activity periodic

*Recruitment and Training of Person*y procedures second to fundamental investigation. yee appeared for meeting the problem of geront ver, no mechanical de- and training of personnel. l acumen of the examining he apparent deficiencies of is the fact that this system tion of the doctor-patient

and Industrial Medicine and Public He
Session of the American Medical Associ

men and women in the field. On this topic I would again emphasize that we do not wish to train gerontologists, but rather biochemists, physiologists, internists, and others who have a special interest in problems of aging.

It is desirable to establish a few major centers of research and education, but make certain they do not become ivory towers isolated from other activities and fields.

Provision of Medical Care.—A third topic I wish to discuss briefly is more prosaic than research and education, and that is the provision of medical care, both professionally and physically, for an aging population.

It is recognized that the older person has greater need of the physician. The tentative figure of the Health Insurance Plan in New York gives some idea of the magnitude of this. For men 65 to 69 the average physician service per year was 4.9 visits as compared to an average of about 3.5 visits in the 20's and 30's or almost 50% greater. With women the utilization rate in the aged is not as great as during the reproductive period so there is no problem because of the increase in the higher age groups.

On the physical side, there is the question of the size and type of hospitals. First, there is a progressive increase in invalids with increasing age. Invalidism is a relative term, and this accepted fact is nothing more than an indication that we must place increasing emphasis on rehabilitation in our hospitals and clinics. America, for its own salvation, can not tolerate the degree of invalidism we have in the past. Millions of people must be rehabilitated to a useful social and economic life.

Second, older people are admitted to hospitals m
frequently and stay longer. Thus, a given proportio
hospital beds to the population 10 years ago or toda
not adequate for the future. For example, in the Bell
Hospital, New York, the percentage increase in ad
sion of older persons is very different from the shif
population.

Further, many of these older people do not req
the type of hospital care which has been used in the
Our hospitals are designed and operated for the ac
ill person requiring room service plus. Many pati
and particularly those with a chronic disease, re
full hospital service for a few days and then would b
fit physically and psychologically from a modified
plan.

There are many other topics I could discuss. Th
I have mentioned only medical problems is a reflecti
my own primary interests and is not an indication
not believe that the sociologist, social worker, the ec
mist, the psychologist, and many others do not ha
important contribution in this field.

SUMMARY

In summary, my concept of an orientation in g
tology is first, that we have an increasing problen
must give it increasing attention; second, that g
tology is a subspecialty of many other specialties
hence, is interdisciplinary in scope rather than a di
discipline; and third, that individuals from many dif
fields must cooperate in a solution of the problems.

507 S. Euclid Ave.

INDUSTRIAL MEDICAL ASPECTS OF AGING

S. Charles Franco, M.D., New York

We are all aware that a progressively larger proportion of our national population is comprised of middle-aged and older people. In the past 50 years, the average life expectancy of the American people has increased from 49¼ to 67½ years. As a result of this increased life expectancy, the number of persons in our nation who are 65 years of age and over has quadrupled since the turn of the century, while the over-all population figure has only doubled. Today 1 out of 12 persons in our country is over 65 years of age; by 1975 this number will soar to 1 out of every 9 persons.

The increase in average life expectancy has not been associated with a proportionate increase in working-life expectancy. The gap between retirement and death now stands at five and one-half years; about double the length
of that in 1900. Under the present trend it will have
not regar 1975. Industry, if it continues its present re-
roots of the To tices, will be faced with a seriously depleted
led by opportunistic op-heavy pension costs. The individual

which are psychologically and physically degener

For the medical man in industry these facts and
present two serious problems which need attentio
first is an immediate problem and concerns men w
at, or near, the so-called "normal" retirement age
It presents the question to us, "How can we keep
men in the nation's manpower pool as productive
bers?"

The second problem concerns a long-range vie
covers all workers. The problem is this: "How c
prevent the nation's workers from falling prey
diseases of old age—so that they can look forw
longer years of health and productive labor?"

RETAINING ABLE WORKERS OVER AGE 65

The first question was dealt with recently in a
presented at the American Gas Association Conv
by the late Dr. John J. Wittmer, vice-president in
of employee relations at the Consolidated Edison
pany of New York. In this paper, entitled "Are
beards White Elephants?" Dr. Wittmer propose
establishment of a retirement panel to review each w
coming up for age retirement on an individual basis

Consolidated Edison Company of New

Aging before the Section on Preventive
lic Health at the One Hundredth Annual
Association, Atlantic City, June 14, 1951.

the purpose in mind of continuing in industry, beyond age 65, workers who are physically and productively able. This panel would be composed of an executive representing the physical employee groups, an executive representing the nonphysical employee groups, and an executive representing industrial relations activities. It would make its decision, as to whether a worker would be retained or retired, on the basis of an efficiency report submitted by the worker's department and a report on the employee's health status submitted by the medical department. The importance of the medical department to the success of this program can be easily seen.

A LONG-RANGE PROGRAM

If the medical department is important in solving our first problem, it is doubly important in a long-range program designed to help workers to continue for as long as possible as self-supporting producers.

The fact is widely recognized and accepted that it is not a worker's chronological age which necessitates his retirement at age 65, but rather the physical disabilities which normally accompany advanced age. Our aim, then, should be to free workers, as much as is possible, from these disabilities.

Rehabilitation of Workers with Chronic Diseases.—This program would be a two-ply one. The first phase would be concerned with the rehabilitation of workers of any age who are chronically disabled by such medical conditions as heart disease, hemiplegia, arthritis, or tuberculosis, so that the remaining physical capacities of such workers might be effectively utilized and their working life-span lengthened. Very worthwhile results have been obtained by the retraining of workers handicapped by amputation, deformity of limbs, or loss of vision, as we all know. I see no valid reason why there could not be similar industrial rehabilitation of workers disabled by the chronic diseases. Of course, the role of the industrial medical department in the rehabilitation process would be limited to the selection of the type of patient who would be benefited by rehabilitation, and assistance in the selective placement of the retrained worker. The actual rehabilitation process entails, as we all realize, treatment and facilities which do not fit into the scope of an industrial medical department, and would have to be handled by those organizations which specialize in such work.

Administration of the selective placement program would be carried out by a disability panel such as we presently have at Consolidated Edison. This panel, which is composed of representatives from the medical and personnel departments, the operating department concerned, and the executive management, meets weekly to review the problem presented in each case where physical disability has been established by work performance or medical examination, or both. The medical information is kept confidential and is described in broad terms as an "acute" or "chronic" medical condition. The possibility of recurrence or progression of the disease is noted. The prognosis as regards absence frequency and life expectancy is estimated. The physical restrictions required for the welfare of the employee and the safety of others are outlined, and the operating department matches these against the job requirements. At present this panel makes one of two decisions: either the man is retained as being capable of placement in a job where his disability will not affect his work efficiency, or he is retired for disability. It is easy to see how this panel could also be utilized to administer a rehabilitation program and provide for the placement of employees successfully rehabilitated.

Detection and Prevention of Disease.—The other, and larger, phase of our long-run industrial health program would be concerned primarily with the detection and prevention of diseases which would shorten work-life expectancy. As we all know, the leading causes of death today are diseases of the heart and arteries, and cancer. These are diseases which strike primarily at persons over age 40 and are thus the diseases with which we must be most concerned. Of the two, cancer is but a small factor in causing disability in industry. Heart disease is the primary enemy of the older worker, and it is against this malady that our greatest efforts must be expended. Statistical analysis has shown us that hypertension and coronary artery disease are the most prevalent of the cardiovascular diseases in the older worker; in fact, in a review of 1,821 cases of heart disease among the 25,000 employees in our company we found that coronary artery disease, hypertension, and arteriosclerosis accounted for nearly 90% of the cases. It is my belief that an adequate program of preventive medicine on the part of industry can save many of its employees from the crippling effects of such ailments.

I believe such a program should have as its foundation, a periodic physical examination beginning at, say, age 40. The practicability of extending this type of examination to all our employees has encountered the obstacle of time consumed without evidence of tangible return. A multiphasic screening examination that utilizes certain laboratory procedures, without accomplishing a complete physical examination, has been advocated as a means of selecting patients who should undergo more detailed examination. Although the value of the multiphasic screening technique has not been thoroughly established, its use as a preliminary step, to eliminate from further examination those employees who have normal findings, should result in a great saving in time and money and might prove more practical than exclusive use of the time-consuming periodic examination. This multiphasic screening test would consist of blood pressure reading, weight, urinalysis, blood serological test, and possibly hemoglobin determination, electrocardiogram, and ballistocardiogram by a portable direct writing machine. If available, a chest x-ray or photofluorograph would give additional information concerning the lungs and, in some cases, the heart. The screening technique could also be utilized as an aid to the periodic examination by having all the laboratory procedures assembled in one file when the employee appeared for the physical examination. However, no mechanical device can replace the clinical acumen of the examining physician, and, aside from the apparent deficiencies of the screening technique, there is the fact that this system overlooks the personal equation of the doctor-patient relationship.

A complete periodic examination and interview could be accomplished in 20 or 30 minutes, especially if the aforementioned basic laboratory data is prepared in advance. The procedure could be further expedited if the employee appeared for the examination with a short outlined health history form on which he had previously checked certain important items. An outlined physical examination form would allow the physician to rapidly list the clinical findings. Using this technique, the physician will have time to impart advice on errors in diet and habit which seem to be related to degenerative disease. Although health education without a personal physical examination has been proven valueless, an examination with no explanation or advice to the employee involved would also prove without value. Health counselling has proven its worth in the periodic examination of executives.

CONCLUSION

No results can be guaranteed for the programs whi I have suggested, but, if we go slowly, first on a limi scale, and with proper prudence as to the cost involve we may find that these programs can result in a savi for industry of thousands of workers formerly declar unfit for active work, and may bring to thousands of pe sons longer life, improved health, and an opportunity t continue as active members of society long after age 6 The responsibility of the medical department to th worker and to industry will be great. The situation ca for a great deal of clinical acumen and for the develo ment of clinical and administrative techniques to pro erly evaluate our progress in dealing with the problem of aging in industry.

Medical Department, Consolidated Edison Co. of New Yo Inc., 4 Irving Place.

PSYCHIATRIC ASPECTS OF AGING

Leonard E. Himler, M.D., Ann Arbor, Mich.

From a purely chronological point of view, the psychiatric disorders of the aged fall into three main groups: the presenile disorders, which begin as early as the fourth decade; disorders of the involutional period, which occur between 45 and 60; and the senile mental diseases, which have their onset after 60 or 65. But in mental as well as physical health the transition from physiological to pathological aging is influenced by many other factors besides the years the patient has lived. Individual variation in personality is as great in the older as in the younger age groups, and physiological and psychological age by no means always parallel chronological age.

Although certain psychological problems are common to all who reach the period of senescence, it is indeed fortunate that the overwhelming majority of the aged retain their mental faculties to the full. In a study of 477 individuals over 65 who were living in the community, Post[1] found that 81.8% were mentally normal, and of the remaining 18.2%, 14.4% showed borderline changes in their mental functions and habits. Only 3.8% showed evidence of definite psychiatric disability.

In the United States perhaps more than in other countries, the growing preponderance of aged individuals in the population has been reflected in increased demands on public psychiatry hospitals. Approximately one-third of the patients currently being admitted to state mental hospitals are over 60 years of age. A recent survey of 3,386 patients over the age of 65 in five state hospitals in Michigan revealed that this age group has increased the burden placed on state institutions to twice the extent of its increase in the general population.[2] About 38% of patients admitted to mental hospitals at present have senile psychoses or psychoses with cerebral arteriosc osis.[3] Not all aged patients with these two most comm psychiatric diagnoses automatically require commitm to public institutions. When there is inadequate provis for the care of elderly patients in their homes or com nities, institutionalization is sometimes employed nothing more than mild confusion, memory impairm and physical infirmity. Thus the reason for hospitali tion is often primarily sociological rather than psy atric. There is no doubt that the number of aged being committed, even though they are legally eligi could be reduced by intelligent social planning.

Although geriatric psychiatry has the primary res sibility of supervising the care of the aged in mental pitals, its preventive arm is constantly being extende the growing number who could be more economically more satisfactorily cared for without commitment. need is especially great with respect to borderline psy atric conditions with mild mental and emotional dete ration. Treatment of these problems must be the concern of many disciplines. The medical, vocatio and environmental aspects are often as great as the chiatric, and when the principles of preventive me health are combined with these, institutionalization often be delayed or entirely avoided.

PERSONALITY CHANGES OF AGING

There is great need for better understanding of psychological changes which take place with the nor aging process. Many elderly persons are unnecessa alarmed and pessimistic over the changes which are in evitable accompaniment of physiological aging. Just the paralyzing effect of cancerphobia must be combat by vigorous educational efforts, the common "old complex" found even in many who are not otherw neurotic should be alleviated by clearer understand and acceptance of the personality changes to be expec with advancing years. The more characteristic person ity manifestations of age may be listed as follows:

Read in the Symposium on Aging before the Section on Preventive and Industrial Medicine and Public Health at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 14, 1951.

[1] Post, F.: Mental Aspects of Senescence, Brit. M. Bull. 6: 54-56, 1949.

[2] Michigan State Department of Mental Health, A Report of Geriatric Problems in Michigan State Hospitals for the Mentally Ill, March, 1951.

[3] The Problem of the Aged Patient in the Public Psychiatric Hospital, Group Adv. Psychiat., Rep. No. 14, August, 1950.

1. Increased conservatism in mental outlook.
2. Exaggeration of lifelong character traits, opinions, biases, and prejudices.
3. Progressive attenuation of interest in new things and new situations.
4. Disinclination to form new habits and associations.
5. Impairment of memories for recent events, with ease of recall of past memories and indulgence in reminiscenses.
6. Decreased span of attention, lessened capacity for mental work, with greater fatigability.
7. Slowing in speed and diminution in accuracy of thought.

It is apparent that the advantages which accumulated skill, habits of work, experience, and seasoned judgment bring to the aged more than compensate for the slowing of speed and diminished flexibility of mental functions. Undue concern and preoccupation over the physical and mental restrictions, with resulting failure to utilize the personality assets of the advancing years, is a common finding in the neuroses and many of the psychoses of this age span.

PSYCHOLOGICAL CHANGES OF AGING

While there are few psychiatric disorders that do not occur either for the first time or as recurrences after the fifth decade, it is generally true that psychogenic disorders usually make their initial appearance earlier, while by far the greater number of organic brain disorders occur after the fourth decade. As is true of most nervous conditions associated with the menopause, individuals who have been psychologically well adjusted in previous years have less serious personality difficulties in their old age. It is uncommon for psychoneurosis to occur for the first time after the age of 60. In a study of 67 patients over 60 who were hospitalized because of psychoneurotic disabilities, Clow and Allen found that 21 had had adequate personalities, 28 showed conspicuous neurotic traits which did not often seem to interfere with their generally satisfactory adjustment, 13 had made a fair life adjustment with more frequent disabling episodes, and 5 had suffered consistently with neurotic difficulties.[4]

However, there are some special conditions accompanying advanced age which predispose to psychogenic disorders of varying degrees, even in individuals of relatively stable make-up who have not previously come to attention for psychoneurotic symptoms or complaints. The most important of these are (1) concern over health, whether actual or exaggerated; (2) worry over finances and fear of losing security; (3) loneliness and fear of not being wanted; (4) feelings of having outlived one's usefulness; and (5) fear of losing the place formerly enjoyed in the community. The more common external precipitating factors of neurosis in the aged are (1) death of husband or wife; (2) threatened disability from real physical disorders; (3) and, less frequently, problems resulting from financial loss, retirement, breaking up the home, and the necessity of moving into a new and strange environment.[4]

It is worthy of note that the complaints of older psychoneurotic patients revolve about preoccupation with physical symptoms, the gastrointestinal tract being most frequently involved. The aged differ from younger psychoneurotic patients in that they are less disturbed by sexual conflicts. Reactivation of infantile and early adolescent traumatic material frequently occurs in those who have had previous psychoneurotic illness. In general, the neurotic development of aged patients tends to be of a more diffuse nature, with emotional depression recurring as a prominent symptom.

EARLY ORGANIC MENTAL CHANGES

Even when the personality changes of age are accentuated as the result of early organic alteration, the capacity of the individual to adjust is more directly related to his complex cultural, economic, and family problems than to the demonstrable pathologic changes.[5] Very frequently the cerebral impairment is the least important factor requiring psychiatric treatment. It is the reaction patterns of the individual's life which offer the greater challenge to therapy. As Lawton has aptly stated, some of the ostensible mental deterioration of older persons is simply the cumulative effect of poor work habits.

A review of the personality changes found in mild senile mental deterioration reveals clearly the importance of the emotional reactions in determining which of these patients can safely continue to live in the community. Following are some of the more common evidences of simple deterioration:

1. Definite memory failure, with confabulation.
2. Markedly restricted mental activity, with a tendency toward apathy.
3. Aberration of talk; loquacity, rambling, slowing, and poverty of speech.
4. Loss of interest and desire for occupation.
5. Morbid dislike of new things and new ideas (misoneism).
6. Diminished capacity for self-care and neglect of personal appearance.
7. Pathological emotional reactions under stress.
8. Asocial behavior outbursts.

With the possible exception of the last item, none of these disturbances in less severe form must lead inevitably to commitment, but they do require modification of the social and environmental conditions which will permit the aged patient to live with safety and without harm to others. Commitment should be considered only as a last resort for those patients who show destructiveness, aggressive tendencies, combativeness, marked depression, persistent noisiness, resistiveness, and disturbing bewilderment, delusions, and hallucinations.

CONCLUSION

On the preventive side, geriatric psychiatry stands before the great task of joining with all other community resources dedicated to the improvement of the social and psychological integration of the aged within the complex framework of modern society. The first steps toward the goal of healthy transition from middle age to balanced old age will be attained if there is better understanding and acceptance of what is already known about the normal physiology and psychology of aging, if there is greater appreciation of the need for the aged to continue useful interests and activities, and if the aged are given opportunity to maintain an adequate social life and a useful place in the community.

COMPARISON OF EFFICACY OF VARIOUS DRUGS IN TREATMENT OF EPILEPSY

Elinor R. Ives, M.D., Los Angeles

The patients in this study on the comparison of the efficacy of various drugs in the treatment of epilepsy attended the Los Angeles General Hospital outpatient department. Altogether 1,064 charts were reviewed. Of these, the records of only 212 patients seemed adequate for this study. Ages of the patients ranged from less than 1 year to 80 years, with over one-half between 21 to 50 years old, and about one-quarter under 21. The length of time over which seizures had been experienced varied from less than 1 year to over 62 years, with one-quarter of the patients having had seizures over 15 years, and more than one-half, over 6 years.

ETIOLOGY

There was significant evidence of an organic lesion in 104 patients, and of familial incidence in 11. In the remaining 97 patients etiology could not be definitely established. Of the 104 patients with organic pathology, in 10 the pathology was owing to birth injury, in 25 to later trauma, and in 29 to infection, of which 11 were luetic, and 18 meningitic, encephalitic, or due to brain abscess. Space-occupying lesions or their sequelae were responsible in six, cerebrovascular disorder in five, and alcoholism in five. There was one patient with each of the following: Danlos-Ehler disease, Sherwood-Moore [1] syndrome, hypoglycemia, and diabetes. Porencephalic cyst or cortical atrophy was demonstrated in seven other patients. In the remaining 13 patients, more than one of the above factors was present. Electroencephalograms, -rays of the skull, and spinal punctures were performed on about one-half of the total group of 212 patients. Pneumoencephalograms were done in 22 patients, angiograms or ventricle studies in 6, and cranial surgery was done in 10.

Seizures were classified as petit mal, jacksonian, autonomic, or psychomotor, only when they were unmistakably these types. The remainder were divided arbitrarily into grand mal if sufficiently severe to cause the patient to fall, or minor-mixed type if the patient remained upright.

Anticonvulsants included phenobarbital sodium, diphenylhydantoin (dilantin®) sodium, methylphenylethyl hydantoin (mesantoin®), mephobarbital (mebaral®), amphetamine (benzedrine®) sulfate, trimethadione (tridione®), and "nuvarone" (3-methyl, 5, phenylhydantoin), an experimental drug furnished through the courtesy of the Abbott Laboratories, North Chicago, Ill. The effectiveness of the anticonvulsant was determined by comparing the number of seizures in the six months preceding its use with the number of seizures occurring in the six months following the administration of the drug. In those instances where patients continued to have seizures and therefore were given several anticonvulsants, the period of observation for each drug was often much shorter but seizures were still computed on the basis of incidence per six months. Patients were termed controlled if they had no seizures or auras in the six-month period; they were called improved if the number of seizures was reduced by over 50%.

PHENOBARBITAL

Phenobarbital was taken by 111 patients. In 34 instances it had been prescribed before the patient first attended the clinic and was the base line used for the effectiveness of other drugs. In 77 patients administration was begun in the clinic. Of these, 30 patients (27%) showed control, and 21 patients (19%) improvement. There was an increase in the number of seizures in 15 patients (13.5%). The best results occurred in the group of 53 patients who had had no previous treatment. Seizures were suppressed in 24, or roughly one-half of these, compared to 6, or about one-quarter of the group of 24 patients who were taking other anticonvulsants when placed on phenobarbital. Success varied with the type of seizure. The grand mal, minor-mixed, and petit mal types were benefited about equally; the psychomotor to a lesser extent; and the jacksonian least of all, with no patient freed from seizures, and 3 out of 7 patients made worse.

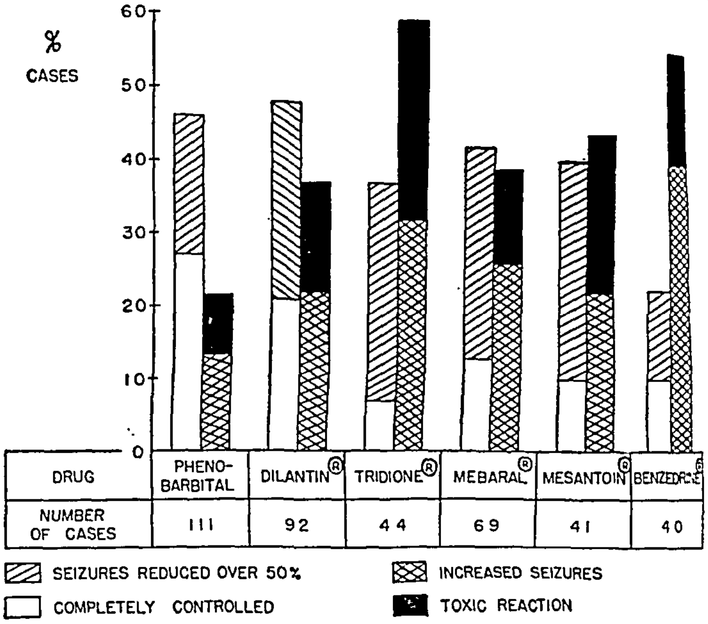

Fig. 1.—The effect of six drugs on 212 patients with epilepsy.

Undesirable side actions included drowsiness, dizziness, dermatitis, staggering, and changes in behavior. These behavior changes were described respectively as disagreeable, mean, nervous, silly, or pugnacious. Phenobarbital therapy had to be stopped in nine instances (8%).

Read before the Section on Nervous and Mental Diseases at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 14, 1951.

[1] Christian, H. A., and Mackenzie, J., Editors: Oxford Medicine, New York Oxford University Press, 1932, Vol. 4, p. 502 (Supp. 17).

DIPHENYLHYDANTOIN

Diphenylhydantoin was given to 92 patients. Eleven of these were receiving this drug when first seen in the clinic, and the number of seizures on this medication was used as the baseline for the effectiveness of other anticonvulsants. Complete relief from seizures was obtained in 19 patients (20%) and partial relief in 25 patients (28%). Seizures were aggravated in 20 instances (22%). This aggravation may have been due in part to the administration of ascorbic acid in conjunction with the diphenylhydantoin in the majority of patients. In contradistinction to phenobarbital, with which the best results were obtained in those patients who had not had previous treatment, diphenylhydantoin was as effective in the 58 habitués of the clinic as in the 21 neophytes. Unlike phenobarbital also, diphenylhydantoin proved the most effective in the jacksonian and psychomotor types; the least in the minor-mixed and petit mal types. Toxic reactions included encephalitis (1 case), psychotic behavior (2 cases), and staggering, hypertrophy of the gums, mental confusion, dermatitis, vomiting or hirsutism (27 cases). Symptoms necessitated discontinuing the diphenylhydantoin in 14 cases (15%).

MEPHOBARBITAL

Mephobarbital was prescribed for 5 patients alone, and for 64 with other anticonvulsants, (a total of 69 patients). When given alone, 3 patients were controlled and 2 were made worse; in conjunction with other anticonvulsants, 6 patients had no seizures in six months, 20 had fewer, and 14 had more. In all, 13% of the patients were controlled and 29% had a reduction of seizures by at least one-half. In 16 instances (23%) the seizures were increased. Classified according to seizure type, results were slightly less effective in the jacksonian, but rather evenly distributed throughout the others. Previous medication seemed a factor. Patients who had been on phenobarbital with more or less success for a number of years progressed well on mephobarbital. Toxic symptoms included sleepiness, "dopeyness," fatigability, and dermatitis. The drug had to be stopped in 11 patients (16%).

TRIMETHADIONE

Trimethadione was prescribed for 44 patients. In the two instances when it was given alone, one patient with autonomic seizures was controlled, and the other with a minor-mixed type was made worse. In all, complete suppression of seizures was achieved in 3 patients, and a reduction by over one-half in 13 patients, summing up to 36% of patients improved. In 14 persons (32%) the seizures were augmented. Surprisingly, of the 14 patients exhibiting petit mal attacks, only 4 (28%) were helped, and the same number, 4, were made worse. Whereas, of the 20 patients with grand mal attacks, 9 (45%) were helped, as well as 9 made worse. However, the comparison of the total number of seizures experienced by the patients in the six months' treatment with trimethadione is more in keeping with previous reports. The 44 patients revealed a 40% decrease in the number of petit mal seizures, but only an 18% decrease in the number of grand mal seizures. Narcolepsy or excessive sleepiness which was not due to medication was lessened in three patients. In general, the jacksonian, psychomotor, and minor-mixed seizures were not much affected. Toxic manifestations included delirium, neutropenia, dermatitis, gastrointestinal disturbances, malaise, dizziness, and glare phenomenon, and were sufficiently severe to warrant cessation of medication in 12 patients (27%).

METHYLPHENYLETHYL HYDANTOIN

Methylphenylethyl hydantoin was given to 41 patients, to 3 without other medicaments. Four patients, in one of whom it was the sole drug administered, were freed from seizures, and 12 partially freed, a total of 39%. Nine patients (22%) became worse. Best results were obtained with the jacksonian and petit mal seizures; the worse with the minor-mixed type. One psychomotor patient was made better, one worse. One man who had no seizures on phenobarbital and diphenylhydantoin so long as he abstained from liquor found that when taking methylphenylethyl hydantoin as well he could indulge in an occasional drink. Toxicity was manifested by hallucinations (1 case), febrile reactions with agranulocytosis (4 cases, 2 of which were severe), and weakness, drowsiness, or dermatitis (11 cases). The drug had to be discontinued in 9 instances (22%).

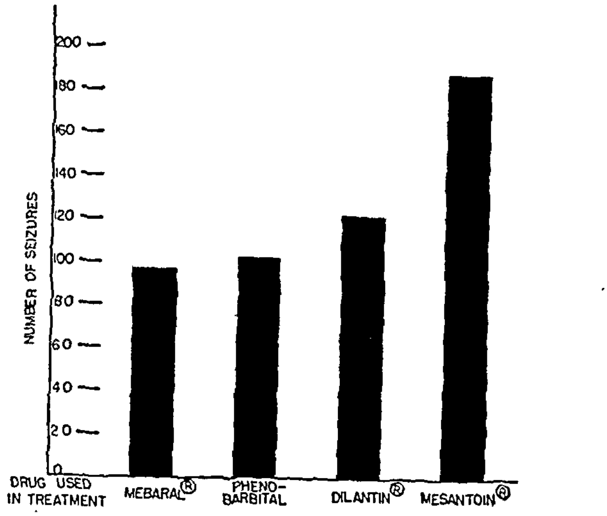

Fig. 2.—Number of grand mal seizures occurring during six months' treatment of 14 patients with epilepsy.

AMPHETAMINE

Amphetamine sulfate was administered to 40 patients, in all instances in association with other anticonvulsants. It was usually prescribed because of the excessive drowsiness engendered by the anticonvulsants or because of behavior disorder. In 4 patients the seizures were completely relieved, and in 5 they were reduced, making a total of 22% of patients assisted. In 16 (40%), however, the seizures were aggravated. Behavior was better in six patients, but more offensive in three. Control of seizures occurred only in the grand mal and petit mal types. Undesirable side effects included insomnia, anorexia, loss of weight, nervousness, irritability, moodiness, and impotency. The drug was stopped because of these in six patients (15%).

"NUVARONE"

"Nuvarone," an experimental drug furnished through the courtesy of the Abbott Laboratories, was tried on 16 patients. Seizures were lessened in eight and increased in three. The two patients with jacksonian seizures were helped. Unfortunately, however, toxic manifestations necessitated discontinuing the drug in 10 patients (62%), although this was done with regret since several of the patients were progressing well. Toxic reactions included depression of the red or white blood cells in three, dermatitis or itching in five, diarrhea in one, and drowsiness or unclear mental state in three.

RESULTS

Complete control, defined as no seizures or auras within a period of six months, was achieved in only 65 patients (30.6%). Of these, 25 received a combination of phenobarbital and diphenylhydantoin, 20 phenobarbital alone, 5 diphenylhydantoin alone, 4 a combination of diphenylhydantoin and mephobarbital, 2 methylphenylethyl hydantoin alone, and 1 mephobarbital alone. The remainder took combinations of the above, and also amphetamine in 6 instances, trimethadione in 5, and glutamic acid hydrochloride in 1. One patient with hypoglycemia stopped having seizures only when he changed to a strict high-protein low-carbohydrate diet. Patients with psychomotor seizures did the best, with 5 out of 13 controlled; those with the minor-mixed type did the worst, with only 4 out of 39 (or about 10%) becoming free from seizures. In between were the 29 patients exhibiting jacksonian seizures, of whom 4 (14%) were freed from seizures, and the 37 patients with petit mal seizures, of whom 9 (24%) were controlled.

Etiology proved a factor. In 13 (52%) of the 25 post-traumatic cases, the seizures were suppressed, whereas in less than 20% of the patients with organic lesions other than trauma or infection were the seizures noticeably decreased. As would be expected, the most successful results were found in the 6 to 20-year-old group, the worst in the patients over 50. Unexpectedly, to me at least, the length of time over which the patient had had seizures did not play a significant part in the result.

COMMENT

In the series of 212 patients, 27 took only one anticonvulsant, and 33 took over five. Since it is the general practice at the clinic to start patients on phenobarbital, it was felt that the other anticonvulsants had been tried on cases more resistant to therapy and therefore wer not being fairly evaluated. To obviate this element, co parison was made of the number of grand mal seizure occurring per six-month period in 14 patients who received phenobarbital, diphenylhydantoin, methylpheny ethyl hydantoin and mephobarbital (Fig. 2). Duri trial with mephobarbital, the 14 patients had a total o 96 grand mal seizures in a period of six months; wi phenobarbital, 101; with diphenylhydantoin, 121, an with methylphenylethyl hydantoin, 187. However, sin it has been my practice to pyramid anticonvulsants, gi ing them together instead of substituting one for anothe I wonder if this evaluation is fair to phenobarbital an diphenylhydantoin.

The total number of seizures occurring during the s months preceding and during medication with each ant convulsant was next computed for each type of seizu (Table). This revealed certain dissimilarities. For i stance, the minor-mixed seizures were alleviated phenobarbital when considered from the standpoint patients helped, but in actual numbers they were au mented. In treatment with diphenylhydantoin the opp site happened. These discrepancies, however, we owing to a few patients with such an excessive numbe seizures that their improvement or relapse oversl owed the results obtained in the other patients who much fewer seizures. The total number of seizures cl fied the findings with trimethadione. Although more tients were completely freed from grand mal attacks t from petit mal attacks, there was a far greater supp sion of petit mal seizures (40%) than of the grand (18%).

In reviewing the records of the patients, some of wl have been followed over 12 years, I was impressed certain incongruities. Thirty-five patients either impro or relapsed without demonstrable change in their he or environment, and certainly without correlation medication. In some patients specific anticonvuls produced at one time a toxic reaction or increase of s ures, but at a later date had no untoward effect greatly benefited the patient. This occurred in one pati at least, with practically all of the anticonvulsa Rarely, the opposite happened: one patient who been controlled by phenobarbital and diphenylhydan for nine years developed a phenobarbital dermatitis.

Because emotional stress is known to precipitate s ures, it was felt that emotional imbalance in the pati might explain the incongruities. The patients were viewed, therefore, for any gross manifestation of

Comparison of Total Number of Seizures in Six-Month Period Before and After Administration of Anticonvulsant

	Type of Seizure														
	Grand Mal			Minor-Mixed			Jacksonian			Petit Mal			Psychomoto		
Drug	No. of Cases	Before	After	No. of Cases	Before	After	No. of Cases	Before	After	No. of Cases	Before	After	No. of Cases	Before	A
Phenobarbital	76	873	879	9	289	445	7	109	47	8	942	227	8	50	
Diphenylhydantoin (dilantin®)	65	715	553	19	1,207	201	11	384	126	2	21	31	3	63	
Methylphenylethyl hydantoin (mesantoin®)	26	265	309	4	40	74	4	71	12	7	52	21	2	84	
Mephobarbital (mebaral®)	40	672	361	6	98	59	5	110	72	6	716	362	2	48	
Trimethadione (tridione®)	14	126	104	7	270	214	5	83	44	11	259	155	2	74	
Amphetamine (benzedrine®)	29	303	449	2	44	19	1	26	79	7	180	293	2	64	

balance. Of the 212 patients, 41 (19%) had apparent personality deviations. There were six patients with chronic alcoholism, seven who had attempted suicide, one suicide, and one drug addict. The 65 controlled patients included 11 (17%) with emotional disturbances, relatively almost as many emotionally disturbed patients as in the total group. However, of the 35 patients who improved or relapsed without apparent reason, 13 (37%) exhibited abnormal personality reactions. Since time did not permit proper psychiatric evaluation, no conclusion can be drawn, but the above suggests that manifest emotional imbalance is not a factor in perpetuating seizures but may lead to ambiguous results in their treatment.

SUMMARY

In this series of 212 patients, phenobarbital produced the highest per cent of controls and the lowest incidence of toxic manifestations. Mephobarbital (mebaral®) and diphenylhydantoin (dilantin®) rivaled each other both in effectiveness in alleviating the seizures, and in their toxicity in aggravating the seizures or in causing unfavorable side actions. Methylphenylethyl hydantoin (mesantoin®), amphetamine (benzedrine®) sulfate, and trimethadione (tridione®) controlled or helped some patients but made a greater number of them sick. "Nuvarone" proved of aid but hazardous, with a 62% incidence of toxic manifestations.

EPIDEMIOLOGY OF UPPER RESPIRATORY TRACT DISEASES

Richard G. Hodges, M.D., Cleveland

In this portion of the panel I shall discuss the epidemiological aspects which have a bearing on the therapy and prevention of upper respiratory tract diseases. Many efforts have been made to prevent upper respiratory tract diseases by immunization and by attempts to break the chain of transmission. The purpose of this paper is to show, on epidemiological grounds, why these attempts have failed and to indicate the points that must be understood before actual prevention can be achieved.

First, it is necessary to define what is meant by upper respiratory tract disease. I shall include under this term all the nonspecific infections that involve the upper respiratory tract and recognize the fact that in a large proportion of these illnesses the lower respiratory tract is also involved. The scope of the problem is illustrated in the first table, which shows the experience of a group of normal families which my colleagues and I have had under close observation over a period of several years for the occurrence of all illnesses. Of the 1,040 attacks observed during 1948, less than 3% could be assigned a definite etiology.[1] Since this is a panel on therapy, it is worth pointing out that the policy of treating all respiratory symptoms with sulfonamides or antibiotics would result in a useless waste of 95% of the drugs administered.

A major stumbling block in the understanding of this group of illnesses is the inability to fit them into any meaningful classification. Etiological studies are at present confined to the use of human volunteers. By this method it has been possible to demonstrate that at least two different types of presumably viral agents exist. But the method is so difficult that it has not been possible to investigate the probability that a whole range of agents, or strains of agents, enter into the etiology. Attempts to make a clinical classification are equally unsatisfactory. In a given family episode, which is presumably caused by a single agent, the various members demonstrate a wide range of clinical severity and anatomical localization of symptoms. This variability in host response, plus the probable existence of multiple etiological agents, results in a spectrum of illness rather than an orderly arrangement of subdivisions. However, by studying the behavior of the whole group it is possible to make certain pertinent observations.

The first epidemiological feature is the consistency with which the population is attacked year after year. This has been the experience of the population of families mentioned previously and has been observed by others.

It is possible to place some interpretation on this consistency. It is evident that any natural immunity conferred must be of extremely brief duration. Otherwise a constant incidence of six attacks per person per year would not occur. From this it follows that even though it should become possible to induce artificial immunity the procedure would have to be repeated at such frequent intervals that its feasibility would be very doubtful. There is a chance, but a very long one, that each of the six attacks per year is due to a different agent which establishes a relatively good homologous immunity. Should this be true, one would then be faced with all the problems of a polyvalent immunizing agent, a dilemma which is well illustrated by the present status of influenza immunization. Therefore, I think that it can at present be said that the hopes for immunization against upper respiratory tract diseases are small. Even less hopeful are the so-called "cold shots," since the ingredients therein have never been proved to have anything to do with the pathogenesis of common colds.

TABLE 1.—*Incidence of Illnesses in a Group of Normal Families*

Diagnosis	No. Illnesses	% of Total
Undifferentiated respiratory diseases.....	975	93.7
Streptococcal sore throat................	14	1.4
Nonstreptococcal exudative pharyngitis.	42	4.0
Primary atypical pneumonia............	7	0.7
Pneumococcal pneumonia................	2	0.2
Total................................	1,040	100.0

From the Departments of Preventive Medicine and of Pediatrics, School of Medicine, Western Reserve University.

Read in the Panel Discussion on the Therapy of Infectious Diseases before the Section on Pediatrics at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 13, 1951.

[1] Dingle, J. H.; Badger, G. F.; Feller, A. E.; Hodges, R. G.; Jordan, W. S., Jr., and Rammelkamp, C. H.: A Study of Respiratory Infections in Families, Tr. A. Am. Physicians 62:99, 1949.

Another very constant feature of upper respiratory tract diseases is its seasonal occurrence. It is usual for a summertime low incidence to be followed by a very sharp autumnal rise. After this a high but irregular plateau of incidence is maintained until late spring, at which time a sharp decline occurs.

Two factors are apparently at work to cause the sharp autumn peak in incidence. The first is an increased susceptibility of the population. Decreased contact with upper respiratory tract infection appears to lower the resistance at the time of next exposure. This is a constant experience of explorers and others who spend two months or more out of contact with organized society. Return to civilization coincides with the acquisition of respiratory disease. The same has been shown to occur on a grander scale in isolated communities. Winter on the Island of Spitzbergen is characterized by a freedom from respiratory ills; the arrival of the first ship in the spring is followed by an epidemic wave. I would surmise that the relative dispersion of our populations in the fresh-air environment of summer gives rise to the same phenomenon. There thus exits the paradox that in order to avoid becoming susceptible one must have frequent infections.

The second factor appears to be the recongregation of the population in school and in other closed spaces. The autumnal rise in incidence is coincident with this environmental change, and the high incidence prevails until the advent of truly warm weather. The exact path of transmission that is followed in closed environments, however, is still obscure. It is easy to say that the infection is air-borne, but this is not the whole explanation. For example, it has been shown that certain procedures, such as the use of ultraviolet light, aerosol sprays, or the oiling of floors and bedding, will decontaminate the air of bacteria and certain viruses. And there is some evidence that the application of those measures to hospital wards will reduce cross infection. However, the attempts to apply air decontamination to environments in which normal activity is taking place, such as schools or military barracks, have met with uniformly disappointing results. Other evidence that the infectious agents do not circulate uniformly through the atmosphere of closed environments is found in the spread of upper respiratory tract disease through families. Young children acquire upper respiratory tract diseases much more readily from one another than they do from older children or from adults. Mothers are more readily infected by children than are fathers. Thus mere presence in the household atmosphere is not the whole story; the amount and intimacy of close physical contact appears to be another factor. In view of the relative failure of air decontamination, attempts to break the chain of transmission must begin with a more thorough elucidation of this factor of close contact.

There is one procedure that actually does appear to reduce the incidence of upper respiratory tract diseases, and that is the process of growing older. It is a familiar fact that adults suffer less than do children, but the effect of age is much more specific than that. The most susceptible time appears to be in the second year of life, and after that there is a steady increase in resistance. Once again, this epidemiological feature offers little toward the prevention of upper respiratory tract ills.

In summary, the main epidemiological features of upper respiratory tract diseases fail to indicate that any effective methods of control are immediately available. Future advances will depend on (1) the isolation of the agent or agents so that their behavior can be exactly studied, (2) determination of the manner in which the agents actually spread from one person to another, and (3) understanding of the beneficial effect of age, with the hope that this phenomenon can be produced artificially.

Western Reserve University School of Medicine.

SELECTION OF ANTIMICROBIAL AGENTS BY LABORATORY MEANS

Earle H. Spaulding, Ph.D.
and
T. G. Anderson, Ph.D., Philadelphia

The advent of antibiotic therapy had a profound effect on the diagnostic microbiological laboratory. Technical procedures, such as pneumococcus typing, became useless as therapeutic tools, and for routine purposes it was no longer necessary to identify micro-organisms beyond the point of determining that they did or did not belong to a pathogenic species. On the other hand, a new technique of prime importance has been developed—i. e., the antibiotic susceptibility test. With it the laboratory can give valuable aid to the clinician in the selection of the most effective chemotherapeutic drug for his infectious patients. The present discussion deals with the use and value of this procedure.

The foregoing statements are not intended to imply that bacteriologic specimens need to be collected in all cases. As any clinician knows, most mild and uncomplicated acute infections respond promptly to empirical administration of any one of several antibiotics in general use. On the other hand, certain types of cases require bacteriologic guidance if the therapeutic program is to be maximally effective. These fall into three classes: (1) fulminating infections requiring hospitalization; (2) cases which fail to respond after 72 hours of routine chemotherapy[1]; (3) infections which relapse, especially if there is a change in the character of the infection suggesting alteration of the bacterial flora.

From the Department of Microbiology, Temple University School of Medicine and Hospital.

Read in the Panel Discussion on the Therapy of Infectious Diseases before the Section on Pediatrics at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 13, 1951.

[1] Furstenberg, A. C.: Antibiotics in the Treatment of Diseases of the Ear, Nose and Throat, Ann. Otol. Rhin. & Laryng. 58:5, 1949.

The diagnostic microbiologic laboratory is now being used more than ever. The reason for this appears to be an increasing recognition by the clinician of the value of antibiotic susceptibility tests. As long as penicillin was the only antibiotic available, bacteriologic study served no purpose except to establish that an infectious process was present. However, the successive introductions of streptomycin, bacitracin, chloramphenicol, aureomycin, and terramycin created a state of confusion because of the overlapping spectra of these antibiotics and because of other factors which will be discussed later. As a result, the clinician is now faced with the problem of having to select the proper antibiotic to use in each individual case which falls within one of the categories previously mentioned. Although cost, ease of administration, and risk of undesirable side reactions must be considered in making this choice, the determining factor should be the susceptibility of the infecting micro-organism. Because the in vitro susceptibility test is a practical procedure, it constitutes a valuable and often indispensable aid in the successful therapy of bacterial infections, and its performance is now a primary function of the diagnostic laboratory.

It is impossible in many instances to select the proper antibiotic on the basis of the nature of the infection. Pneumonitis, meningitis, surgical infections, and other conditions may be caused by a variety of micro-organisms with very different chemotherapeutic susceptibilities. Even though the identity may be known, it is not always possible to say that penicillin or some other antibiotic is the one of choice. It is true that certain delicate bacterial types are highly susceptible to most chemotherapeutic drugs. Group A hemolytic streptococci, pneumococci, and gonococci are examples. In contrast, the hardier varieties, such as staphylococci and various gram-negative bacilli, not only are more resistant as a group, but the individual strains within a single species may show striking and unpredictable variation in their susceptibility to any one drug.[2] This means that the most active antibiotic for four separate strains of Pseudomonas may in each instance be different. The same situation exists with Proteus bacilli, enterococci, Hemophilus pertussis, salmonellae, and coliform bacilli.

Furthermore, the susceptibility status is constantly changing. Since each bacterial population is heterogeneous in that the individual cells within it vary in resistance to a given drug, the result of exposure to that antibiotic may be the destruction of the more susceptible organisms but the survival of the more resistant mutants. The rapid development of complete resistance to streptomycin is well known. Penicillin, on the other hand, is remarkably free of this undesirable property, although there is some evidence [3] that a general bacterial resistance is developing slowly. An exception with respect to penicillin is the Staphylococcus. Because some strains produce penicillinase, an enzyme-destroying penicillin and associated with resistance, these have been selected out over the years, with the result that the proportion of resistant staphylococci isolated from hospitalized patients is reported to have risen from 14% in 1946 to about 60% in 1948.[4] It is as yet too early to predict the rate at which micro-organisms will change in their behavior toward the newer antibiotics, but recent reports [5] point toward a gradual decrease in susceptibility. Under these circumstances it would appear that a chemotherapeutic program based on empirical clinical trial may be extremely hazardous and that the need for laboratory testing will continue to increase as more antibiotics become available.

METHOD FOR TESTING SUSCEPTIBILITY

In order to be practical for routine use, susceptibility tests must be carried out on the primary culture so that there is no delay beyond that required for incubation. Such a test is the disk method which was developed in this laboratory in 1947 [6] and since simplified so that it can be performed by any laboratory capable of culturing clinical material. As originally described, a small filter-paper disk is immersed in a standard antibiotic solution and placed on the surface of a blood agar plate immediately after inoculation with the specimen. After overnight incubation the plate is examined for the presence of bacterial colonies, and the susceptibility of each type of colony is estimated by measuring the diameter of the clear zone of inhibition surrounding the disk (Fig. 1). The larger the size of the inhibitory zone, the greater is the degree of susceptibility. It is possible to test five antibiotics simultaneously, as shown in Figures 1 and 2. As routine procedure, however, we limit primary culture tests to two drugs, penicillin and aureomycin. If the routine test reveals pathogenic species resistant to both these drugs, representative colonies are subcultured to a second blood agar plate on which are placed disks containing antibiotics not previously tested.

TABLE 1.—*Preparation of Standard Antibiotic Solutions for Paper Disk Susceptibility Tests*

	Concentration per Cc.	Diluent
Aureomycin........................	500 γ	Distilled water
Bacitracin........................	75 units	Isotonic sodium chloride solution
Chloramphenicol..................	700 γ	Distilled water
Dihydrostreptomycin..............	500 γ	Distilled water
Neomycin..........................	300 units	Distilled water
Penicillin G......................	50 units (30 γ)	Distilled water
Terramycin........................	500 γ *	Distilled water

* As currently supplied by the manufacturer, this product assays at 900 to 925 γ per milligram of powder.

The concentrations of the standard antibiotic solutions used in this laboratory are listed in Table 1. They were chosen in most instances after rather extensive comparison with the results of tube dilution and agar plate tests and after a trial period of observation for clinical correlation. However, these figures will no doubt be changed from time to time as more experience is acquired. It is likely, for example, that the concentration of the penicillin solution should be increased to 75 or 100 units (45 or 60 γ) in keeping with the present tendency to employ increasingly larger therapeutic doses. Standard solutions are prepared from concentrated stocks which have been stored in the frozen state. It is our practice to use fresh tubes of penicillin and aureomycin each day, but this is not necessary with the other antibiotics which show little loss in activity during one-week's refrigeration.

The principal disadvantage of the original procedure is that each laboratory must prepare its own standard solutions. This is a time-consuming step and one which requires some understanding of the physical properties of the different antibiotics if accuracy is to be attained. Therefore, an important modification of this technique was the commercial development of dried disks and tablets.[7] These may be transferred directly from the manufacturer's vial to the surface of the freshly inoculated plate and so are admirably suited to the needs of the small hospital laboratory.

INTERPRETATION OF DISK SUSCEPTIBILITY RESULTS

The disk method was designed for simplicity and not for a high degree of accuracy. Therefore, the results obtained in most laboratories are only indications of the susceptibility level. Although this appears to be adequate for all practical purposes, many users translate the disk zone results into a specific number of units or micrograms per cubic centimeter of susceptibility. In this connection it may be well to point out that under the controlled conditions of our laboratory the results of triplicate tests may vary up to ± 25%.

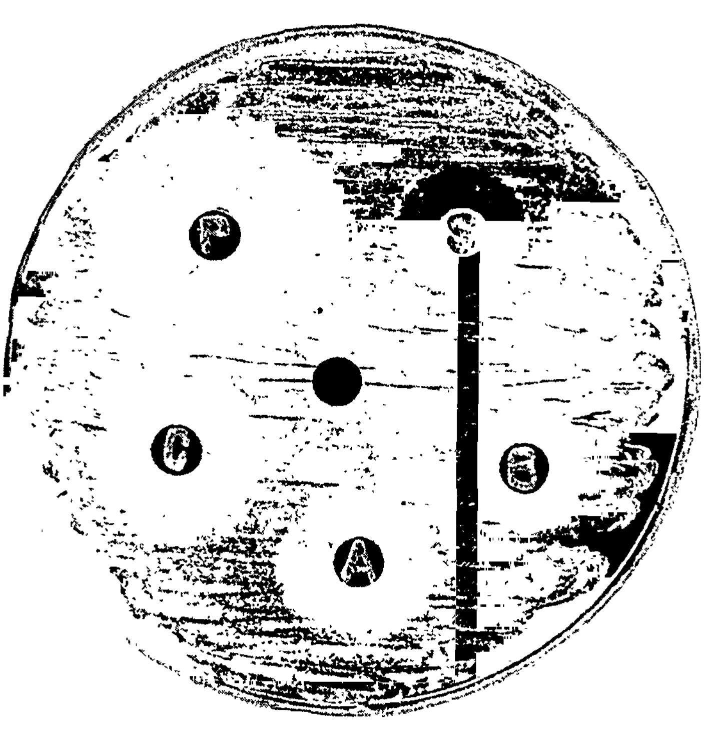

Fig. 1.—Antibiotic disk tests with a pure culture of Staphylococcus. P, indicates penicillin; S, dihydrostreptomycin; B, bacitracin; A, aureomycin; C, chloramphenicol. Control (isotonic sodium chloride) disk is in the center. This organism is very susceptible to penicillin and moderately susceptible to the others.

Proper interpretation of the results requires an understanding of the variable factors. The standard antibiotic solutions must be prepared accurately. The paper disk should be removed from the antibiotic solution with fine-pointed alcohol-flamed forceps and given one vigorous flip before it is placed on the agar plate. Another variable of considerable importance is the composition of th culture medium. Our data are based on the use of trypticase soy agar containing 5% horse blood, which we eminently satisfactory, but it must be emphasized that other types of media may give quite different values. Although the use of a standard medium is highly desirable, the users of commercial disks should follow any recommendations which may accompany them. Finally, a most important factor is the amount of growth present in the culture. In general, the size of the inhibitory zone is inversely related to the number of colonies present. It can repeatedly be demonstrated that when an undiluted inoculum is compared with a 1:100 dilution made from it, the culture plate containing the latter will show significantly larger zones and often the presence of a small zone which is absent in the undiluted culture. Thus, an intelligent interpretation of the disk results must allow for the effect of these variables. If due allowance is made the results justify classification of any bacterial culture as (*a*) very susceptible, (*b*) moderately susceptible, (*c*) slightly susceptible, or (*d*) resistant.

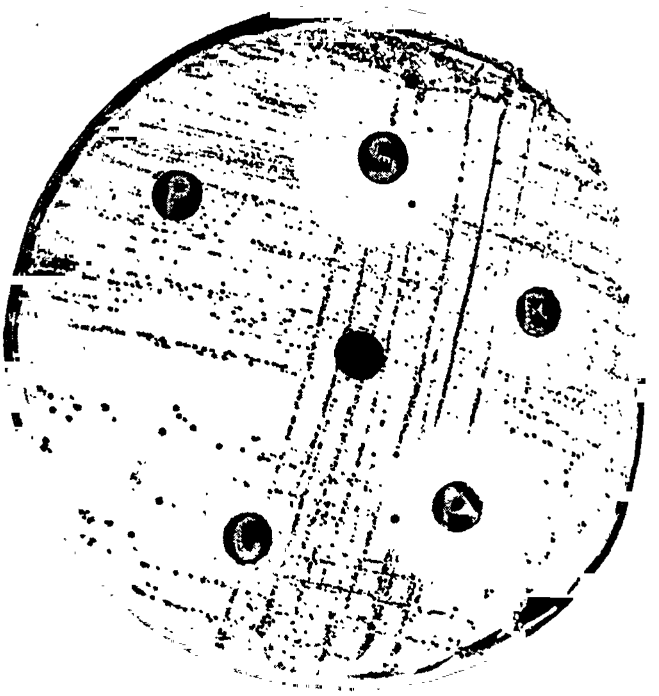

Fig. 2.—Antibiotic susceptibility tests with a nasopharyngeal culture containing a coagulase-positive Staphylococcus (large colonies) and a Group A hemolytic Streptococcus (small colonies). Identity of disks is same as in Fig. 1. The Staphylococcus is resistant to penicillin chloramphenicol, slightly susceptible to bacitracin, very susceptible to aureomycin. Note streptomycin zone containing resistant mutant colonies indicating that this drug should not be used. The Streptococcus is very susceptible to aureomycin, moderately susceptible to penicillin and dihydrostreptomycin, slightly susceptible to bacitracin and chloramphenicol. Aureomycin is the antibiotic of choice.

The clinician may well ask the meaning of disk susceptibility classifications in terms of dosage. For example, is 2 gm. a day of aureomycin adequate for an infection due to a moderately susceptible organism? This question cannot be answered completely, since the nature and severity of the infection must be considered. However, the figures in Table 2 show the relationships which exist between zone sizes observed with moderately susceptible organisms and the minimal inhibitive concentration as determined by other in vitro methods. Since a daily dose of 2 gm. of aureomycin usually produces a blood level within the susceptibility range listed in Table 2, that dosage program would appear to be satisfactory. Very susceptible organisms generally require only half as much, and those reported as slightly susceptible may need at least twice that amount. Here aureomycin is used as an example, but in our institution the same working rule is being satisfactorily applied to the other antibiotics.

COMBINED THERAPY

Bacteria which appear to be resistant or only slightly susceptible in vitro pose special problems of interpretation. As a general rule, those which fail to show any zone in the disk test are not likely to respond clinically. Penicillin, however, is an important exception. The larger doses—3 to 12 million units a day—currently being used in the treatment of subacute bacterial endocarditis and many severe infections produce blood levels beyond the ange of the standard penicillin solution listed in Table 1.

Slightly susceptible bacteria require either large doses of a single drug or moderate doses of two or more drugs in combination. If only one of seven antibiotics under test shows in vitro activity, there would seem to be no choice but to use large doses of that one. There is no evidence to indicate that an organism slightly susceptible to one drug is more effectively inhibited on the addition of another which has no in vitro activity. On the other hand, strains of Pseudomonas, Proteus, Aerobacter, and enterococcus are often reported as being slightly susceptible to two or three different antibiotics. In such instances, it would seem advisable to administer a combination of those drugs rather than increase the dosage of any one of them. Supportive clinical evidence for this view is beginning to appear,[8] and the explanation may lie in the in vitro observations of Jawetz and others,[9] which demonstrate that two antibiotics which are merely bacteriostatic when present alone may have bactericidal activity in combination.

VALIDITY OF IN VITRO RESULTS

Providing the causative organism has actually been isolated, the results obtained by the disk method correlate well with clinical experience. This fact is most clearly shown with infections which have been refractory to prolonged empirical therapy. In most instances the significant bacteria are found to be resistant to the antibiotic previously employed and disappear after administration of the drug selected on the basis of the susceptibility tests. The timely article by Jawetz and Marshall [10] illustrates well the excellent agreement which may be observed. Another situation in which susceptibility tests are particularly useful is in the treatment of infections which relapse after definite clinical improvement. In a majority of instances the primary incitant was susceptible to the antibiotic employed and has disappeared, but it has been replaced by a different and resistant type of micro-organism which often produces a change in the character of the infection. Thus, it can be seen that the susceptibility test is useful as a guide to the initial therapeutic approach and as a safeguard during treatment.

As might be expected, discrepancies do occur between in vitro results and the subsequent clinical response. Many factors in the host, such as absorption, diffusion, and excretion rate, may operate to diminish or increase in vivo effectiveness. Although the explanation in individual cases is sometimes obscure, it seems worthwhile to point out certain factors which are known to be responsible for clinical failure in a case from which only susceptible bacteria were reported. The reason is likely to be one of the following: the causative organism was not among those isolated; the dosage was inadequate; resistant bacterial mutants have grown out; the original susceptible flora has been replaced by a more resistant one; there were mechanical or anatomical barriers limiting access of the drug to the site of infection, such as a walled-off abscess or the valvular vegetations of subacute bacterial endocarditis.

Sometimes the reverse situation is observed, especially with penicillin. Bacteria which appear to be resistant to this drug by the disk method may be rapidly destroyed in the patient's tissues, as evidenced by a clinical cure and the disappearance of the offending bacteria from subsequent cultures. Such observations in our experience have become more frequent with the gradual adoption of larger doses of penicillin. In this connection it should be pointed out that the disk method measures only the bacteriostatic and not the bactericidal concentration. Unlike most other antibiotics in general use, penicillin is rapidly bactericidal for many types of bacteria. Therefore, if, as Eagle believes,[11] the prompt clinical cures frequently observed with the use of this drug are due to its direct killing effect, a dosage which produces a tissue concentration only slightly above that found to be inactive in vitro may be strongly bactericidal. Obviously, the ideal susceptibility test for penicillin would measure not only inhibition but also killing power. Such methods are available and in special instances of great value [10]; as yet, however, they are not suitable for routine application.

TABLE 2.—*Interpretation of Paper Disk Susceptibility Tests*

	Zone Diameters Shown by Moderately Susceptible Organisms (Mm.) *	Susceptibility Equivalents per Cc.
Aureomycin	10-17	2-10 γ
Bacitracin	10-20	1-10 units
Chloramphenicol	10-15	4- 8 γ
Dihydrostreptomycin	10-15	4-20 γ
Neomycin	10-20	4-10 units
Penicillin G	10-20	0.6-2 units
Terramycin	10-15	2- 8 γ

* Applies only to use of 6.5 mm. Whatman No. 2 paper disks.

Finally, it is well to keep in mind the fact that microorganisms are not ordinarily destroyed in vivo by bacteriostatic drugs. Their role in clinical cure is to inhibit growth and thus increase the effectiveness of phagocytosis and other immune mechanisms. Obviously, in vitro tests do not include the immunological factor which always operates in favor of the patient.

SULFONAMIDE TESTING

Only antibacterial drugs which are soluble in water can be tested by the disk method. This requirement eliminates most sulfonamides, except gantrisin® (3,4-dimethyl-5-sulfanilamido-isoxazole), and certain antibiotics such as tyrothricin. Sulfonamide susceptibility can be determined, however, by the usual broth dilution method. But this must be carried out with pure cultures and is practical only in cases of chronic or subacute infections in which the time element is not important. Furthermore, the results are notoriously unreliable and frequently fail to correlate with the clinical response. When dealing with infections due to gram-negative bacilli which are only slightly susceptible to the available antibiotics, sulfonamide testing is indicated, with the possibility in mind that combined antibiotic-sulfonamide therapy may offer the best approach. Otherwise, there seems to be little need for this technique.

COMMENT

The practical laboratory procedures for testing antibiotic susceptibility are almost entirely limited to bacteria. Rickettsia, and viruses cannot be grown in vitro, and of the fungi only the Actinomyces are significantly inhibited by the antibiotics now available. Nor has mention been made here of the methods used for determining susceptibility of tubercle bacilli to chemotherapeutic agents. Although practical techniques are available f doing this, they are not carried out on blood agar pla or by the disk method, which is the basis of the prese discussion.

The diagnostic microbiologic laboratory will undoub edly continue to play an expanding role in the manag ment of infectious disease. As the number of useful an biotics increases and the character of infections change the problem of selecting the most effective antibiotic o combination of them is likely to become even more co plex. Therefore, it seems inevitable that many clinicia who hitherto have made little use of a bacteriology la oratory will feel the need for it and that small communi hospitals which now have poor bacteriology faciliti will have to improve them.

SUMMARY

The complex problem of selecting the most effecti antibiotic drug for treatment of certain types of infe tions has been discussed from the point of view of t laboratory. The disk method for determining suscep bility to antibiotics has been briefly described and eval ated. This procedure is so simple as to be within th scope of any laboratory capable of culturing clinic material. Because the strains within a single bacteri species may vary widely and in an unpredictable ma ner, the laboratory susceptibility test is a valuable a often indispensable guide to successful treatment severe, refractory, or relapsing infections.

Temple University School of Medicine (Dr. Spaulding).

CLINICAL BASES FOR SELECTION OF PATIENTS FOR ANTIMICROBIAL THERAPY

Waldo E. Nelson, M.D., Philadelphia

One of the more important questions of the moment is whether specific antimicrobial agents should be prescribed for the patient ill with an infectious disease. The decision is complicated by a number of factors, not the least of which is the attitude of the patient or of his family. The average patient expects, and not infrequently demands, such treatment with no consideration of whether the causative agent of his particular infection is susceptible to any of the available therapeutic agents. Many physicians are currently choosing the easier course of prescribing supposedly specific therapy for practically all infections. Only when the disease is not terminated by the therapy or spontaneously in spite of it, is serious consideration given to more accurate diagnostic measures and in turn to truly specific therapy, if such is available. There are arguments to support such indiscriminate therapy, but in the opinion of most critical physicians the arguments against outweigh those in favor of it.

The decision of whether to prescribe sulfonamide and/or antibiotic therapy occurs most frequently in regard to acute respiratory infections, the majority of which do not respond to such therapy. Similar decisi must also be made in instances of arthritic, osseo nephritic, and encephalitic diseases, some of *which* not even infectious and some of which, of those wh are, are not susceptible to the available therape agents.

A number of reasons may be presented in support what may be termed indiscriminate antimicrobial thera of diseases which are presumed to be infectious in orig These include (1) quicker recovery, if the etiologi agent happens to be susceptible to the therapeutic ag prescribed; (2) fewer pyogenic complications, as well nonpyogenic ones, such as rheumatic fever and glome lonephritis; (3) unfavorable reactions to the therape agents most commonly employed are relatively few, a (4) patients or their families demand that the so-cal wonder drugs be prescribed or the physician assum that they are favorably impressed when these drugs prescribed.

The arguments against indiscriminate antimicrob therapy far outweigh those in favor of it. These inclu (1) the great economic loss, since the majority of p tients treated are either not benefited by the therapy the benefit is so minimal as not to justify the expen and effort involved; (2) unnecessary therapy has a det

---

Read in the Panel Discussion on the Therapy of Infectious Diseases before the Section on Pediatrics at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 13, 1951.

mental influence on the layman, either making him feel falsely dependent on a therapeutic agent or making him skeptic of all therapeutic endeavors; (3) indiscriminate antimicrobial therapy may lead to increased bacterial resistance to available antimicrobial agents; (4) it definitely results in a less critical attitude on the part of the physician toward diagnostic and therapeutic endeavors; (5) the increasing frequency with which prescribed antimicrobial therapy is responsible for varying degrees of suppression of the disease without cure, thus resulting in severe chronic disabling disturbances and often in a fatal outcome in cases of such infections as those of the meninges, pleura, and bones, and (6) there are no substantial data to indicate that the serious consequences of pyogenic complications cannot be avoided by appropriate therapy instituted at the onset of their clinical appearance in infections which are initially viral in origin.

Perhaps the question which should be posed at this time is somewhat as follows: "Can the busy practitioner evolve a working policy in regard to antimicrobial therapy which is in line with current knowledge and which is applicable for home and hospital patients?" The answer is undoubtedly "no" if one expects a policy which is applicable to all cases, but it is "yes" if one accepts a working basis which is infinitely more satisfactory than the policy of "treat and, if the patient does not get well, attempt to diagnose." The physician must, of course, keep in touch with new developments and adjust his working policy on the basis of the best information available at the moment.

In venturing to suggest some working rules for the management of infectious diseases, I recognize the obvious limitations. The premium is and will continue to be on good clinical judgment.

It is not possible in a paper of this nature to cover all the problems in relation to antimicrobial therapy, and no attempt is made to do so. For the sake of this discussion, separate consideration will be given to certain of the commoner acute conditions, to general policies in regard to chronic infections, to infections in the newborn infant, and to prophylactic antimicrobial therapy.

As stated previously, the most frequent decision in regard to antimicrobial therapy is related to acute infections of the upper respiratory tract. As pointed out by Hodges in another article in this issue, the majority of these disturbances are not affected by antimicrobial therapy. This is especially so of acute infections which occur in epidemics. Acute nasal infections are rarely amenable to such treatment. Infections which are located principally in the pharynx pose a much different problem from the therapeutic standpoint. It is not possible to determine by visual examination which of the exudative lesions are bacterial and which are viral in origin. The former practice of speaking of the average acute pharyngitis as a "streptococcic throat" is no longer tenable. In the isolated, severe case and in the absence of bacterial culture information, the physician is justified in treating the patient with an antimicrobial agent. When there is an epidemic in a given community, however, and the evidence from the initial cases in which treatment was given indicates that therapy is ineffective, treatment in subsequent cases of the same clinical pattern during that particular epidemic need not and probably should not be given except as there are evidences of complications.

In my judgment there is justification at the moment in treating all acute pneumonic infections in infants and small children from the outset with antimicrobial therapy. Pneumococcic pneumonias are brought under control within 24 to 48 hours after initiation of treatment, and hospitalization is rarely required. Widespread interstitial pneumonitides and bronchiolitic infections do not respond with the same degree of regularity. But because of their very serious nature in infants and small children and particularly because a limited number of them do appear to respond favorably, antimicrobial therapy should be tried in all instances. Though it is not the purpose here to discuss the problem of selection of the therapeutic agent in the individual case, it may be pointed out that experience would indicate the selection of aureomycin, chloramphenicol (chloromycetin®), or terramycin in contrast to penicillin and the sulfonamides in such cases.

Infectious disturbances of the gastrointestinal tract cannot be considered in a single category. Though the response of typhoid, Salmonella, and dysentery infections is less dramatic than is, for example, that of pneumococcic pneumonia, present evidence does indicate that they should be treated with antibiotics and/or sulfonamides. Diarrheal disturbances during the period of infancy constitute a major problem. Except in cases of identified bacterial infections, there is no clear evidence that these disturbances are affected by antimicrobial therapy. However, when the diarrheal episode does not subside within a few days, even though no bacterial pathogen is identified, treatment with streptomycin, one of the poorly absorbed sulfonamides, or the more recently introduced combination of bacitracin and neomycin may be tried by oral administration.

In cases of acute pyogenic infections of the urinary tract, it may be justified under certain circumstances to prescribe such an agent as gantrisin® (3, 4-dimethyl-5-sulfanilamido-isoxazole) aureomycin, chloramphenicol, or terramycin without cultural identification of the pathogen. In cases of chronic or recurrent infections, however, treatment should not be instituted until the infecting organism has been identified and its susceptibility to specific antibiotics determined by the method described by Dr. Spaulding in another article in this issue. Furthermore, under such circumstances thorough urographic study is indicated in every case to determine the anatomic reason for the persistence of infection.

Any infectious disease which may result in prolonged illness, produce permanent disability, or endanger life should be treated at the earliest possible moment. Included in this category are meningitis, pleuritis, peritonitis, osteomyelitis and septicemia. Whenever there are clinical indications of any of these disturbances, suitable material should be obtained for diagnostic smear and culture from the site of the infection, if possible, and from the nasopharynx and the blood. If the direct smear does not provide any clue as to the nature of the infecting organism, antibiotic therapy with or without a sulfonamide should be started immediately. Under such circumstances the initial therapeutic agents should be chosen on the basis of the probability of their effectiveness against the bacteria which are likely to invade the portion of the body involved. When the pathogen has been identified culturally and its susceptibility to the various antimicrobial agents determined, the therapeutic program should be revised accordingly.

Infections during the newborn period pose particular problems. The response of the newborn infant to infections may be quite different from that of his older sibling. Fever may be of a lesser degree and may even be absent in association with severe infections. The usual clinical manifestations of such infections as meningitis and osteomyelitis may be absent and the diagnosis missed entirely, except as such localizations are looked for by means other than physical examination. Furthermore, it is important to know that Staphylococcus aureus and a wide range of gram-negative bacilli, many of which rarely exert a pathogenic effect in older children, constitute an important segment of the bacteria which may attack the newborn infant. The infant's vulnerability to infection and relatively low capacity for resistance to established infection make it imperative that antimicrobial therapy be started promptly when infection is suspected. In no instance, however, should such therapy be started until appropriate material for smear and culture is obtained.

The place of antimicrobial therapy in the management of chronic infections is quite different from that in the management of acute infections. Rarely is there the urgency for institution of therapy, so there is time to secure appropriate material for bacterial smears and cultures. Of equal importance is the necessity to plan the therapy in relation to contemplated surgical procedures, such as those for chronic infections of the ear, sinuses, lungs, urinary tract, and the bones. In all instances every attempt should be made to prescribe therapeutic agents hich are known by in vitro cultural tests to be effective gainst the infecting organisms.

The indications for prophylactic antimicrobial therapy are quite limited. Mass prophylaxis is not indicated except perhaps temporarily in closed populations, such as in institutions to control epidemics caused by such pathogenic agents as Streptococcus hemolyticus of the beta type and meningococcus. On the other hand, current evidence indicates that recurrences of rheumatic fever can be significantly reduced by appropriate sulfonamide or penicillin prophylaxis. Similarly, such therapy may be justified under certain circumstances during the convalescent period of acute glomerulonephritis and in patients with nephrosis. Prolonged administration of aureomycin or other antibiotics in infants and children with cystic fibrosis of the pancreas is to be considered as much on the basis of therapy as on that of prophylaxis.

SUMMARY

A considerable portion of antimicrobial therapy prescribed at the present time is unnecessary. More effective utilization of these drugs will result from a more careful selection of the patient to be treated and a more accurate selection of the agent to be employed. Inadequate antimicrobial therapy may result in serious consequences by merely suppressing the pathogenic agent temporarily, thus permitting the establishment of a chronic infection which may leave permanent residual effects and even result in death. The management of infections during t newborn period requires special consideration both di nostically and therapeutically. Treatment of chronic i fections should be based on in vitro susceptibility tests the pathogenic agents and should be planned in relati to any contemplated surgical procedure.

CLINICAL NOTES

SPOROTRICHOSIS RESPONDING TO FEVER THERAPY

Carmen C. Thomas, M.D.
Harold E. Pierce, M.D.
and
Gerald W. Labiner, M.D., Philadelphia

Sporotrichosis in its localized forms is usually read susceptible to iodide therapy. However, when widespre involvement of many viscera exists, the therapeutic pro lem is difficult because of lack of specific antibio therapy at the present time and the often-encounte resistance of this disease to iodides.

The beneficial effect of fever therapy observed in patient described opens possibilities of an added tl apeutic resource. To our knowledge this observation not been reported in the literature.

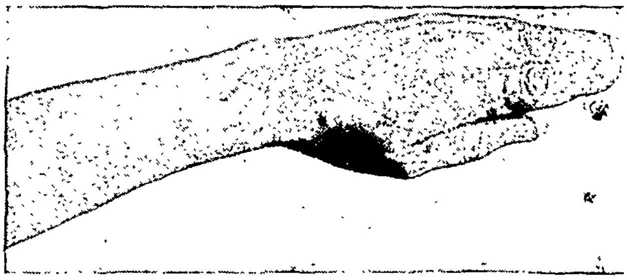

Fig. 1.—Lymphangitic sporotrichosis of the left index finger.

REPORT OF CASE

J. K., a 40-yr.-old Negro man, was first seen in consult on the eye ward where he had been admitted on March 6, 1 for treatment of a recurrent iridocyclitis.

He presented at that time an 8 by 10 mm. moist reddish s ing of the third knuckle of the left index finger. There were t or four hard, deep-seated nodules surrounding this region a series of linear nodules varying in size from 0.5 to 3.0 extending up the radial aspect of the forearm to the elbow 1). These nodules were discrete, firm and nontender. None present above the elbow or in the axillae. No lymph- enlargement was noted, otherwise.

On admission the eyes showed bilateral ciliary injection irregular pupils due to old synechiae and corneal edema diagnosis of iridocyclitis was made. Previous similar attack volving one or both eyes had occurred in 1947 and 1948, nei however, as severe as the present one or necessitating hospi zation. The patient gave a history of syphilis of uncertain d tion, which had been treated intermittently until 1949.

Dr. Albert Kligman, of the Department of Dermatology and S lology, University of Pennsylvania School of Medicine, performed agglutination studies.

From the Division of Dermato-Syphilology of the Philadelphia Ge Hospital, and the Department of Dermatology and Syphilology of Woman's Medical College of Pennsylvania.

The patient gave the following history of the hand lesion: In early February, 1950, while engaged in tearing down a wooden ice-house for lumber, he had scraped his left index knuckle. A small laceration followed by a purulent exudation appeared three to four days later. Occasionally he would express some purulent material from it. In early March several nodules developed about the site of the wound and several others appeared along the forearm. None of these caused local or systemic symptoms, and he had not thought them sufficiently alarming to warrant medical attention.

Laboratory Findings.—The hemoglobin was 14.4 gm., white blood cell count, 5,000; blood sugar, 89; the Wassermann reaction was negative, the Kline, weakly positive; the blood urea nitrogen was 8, the total protein, 6.3; agglutinations for typhoid, paratyphoid, brucellosis and tularemia were all negative; the Weil-Felix reaction was negative; culture by aspiration of the nodule, positive for Sporotrichum schencki. Biopsy of an excised nodule on March 8 showed chronic granulation tissue composed of fibrous tissue diffusely infiltrated with plasma cells, lymphocytes, and polymorphonuclear cells. Focal granulomas were present, most of which consisted of a peripheral arrangement of epitheloid type mesenchymal and giant cells with central collections of polymorphonuclear cells. There was no caseation necrosis. The section was consistent with the diagnosis of sporotrichosis.

Treatment.—For his eye infection the patient was given intravenous typhoid vaccine (five treatments in all) on alternate days, resulting in variable temperatures ranging usually from 101 to 102 F. and, for about seven hours, above 103 F. The eyes cleared rapidly after this treatment and the sporotrichosis nodules also began to recede after the eighth day of fever. The patient was anxious to be discharged, so it was decided to follow the further course of his sporotrichosis in the outpatient department without other treatment. On his discharge March 18 only two nodules were visible to the naked eye, approximately 50% regression having occurred. Cultures were still positive for S. schencki.

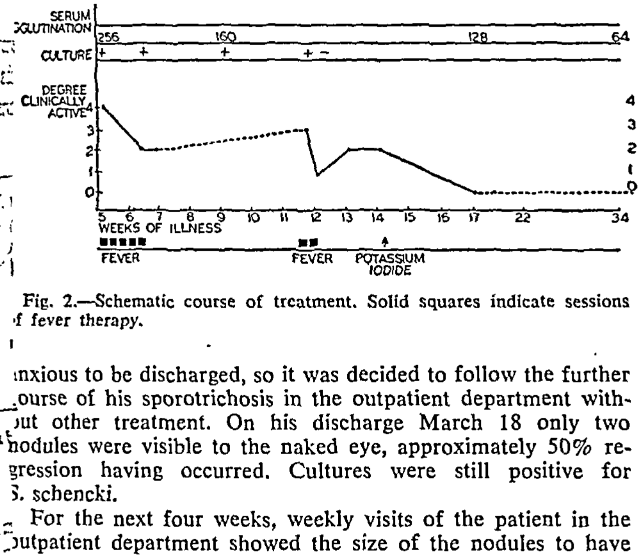

Fig. 2.—Schematic course of treatment. Solid squares indicate sessions of fever therapy.

For the next four weeks, weekly visits of the patient in the outpatient department showed the size of the nodules to have changed very little, and the cultures remained positive. On April 19 the patient was persuaded to enter the hospital again for another attempt at fever therapy. It was planned to give him three or four sessions in the Liebel-Flarsheim (Kettering) Hypertherm Fever Cabinet with a view to producing a temperature of 103 to 104 F over a period of 10 to 12 hours. He received fever treatment on April 24 and April 26 comprising, altogether, nine hours of temperature between 103 to 104 F. He then refused further fever therapy, demanding his discharge on April 27. On that date the nodules had practically disappeared to touch and culture was negative for the first time. Follow-up proved somewhat difficult, but on May 5 it was noted that some of the former wrist nodules had reappeared.

On May 12 the patient was placed on potassium iodide therapy, since slight additional progression had taken place, and his future cooperation was uncertain. Between May 12 and July 1 he took 120 gm. of potassium iodide in the form of a saturated solution. He reported that all nodules had disappeared by June 1. When he was seen on July 14 all lesions had disappeared. The patient felt well and was clinically normal when last seen on Sept. 26. The clinical course and laboratory findings are summarized in Figure 2.

SUMMARY

A 40-yr.-old man with lymphangitic sporotrichosis of the hand and forearm of five-weeks' duration showed regression of lesions after fever therapy with intravenous typhoid vaccine for an unrelated uveitis. A subsequent attempt at hyperthermia with a Liebel-Flarsheim (Kettering) Hypertherm Fever Cabinet (nine hours of temperature above 103 F) produced a dramatic decrease in size of lesions and a negative culture. Poor patient cooperation did not permit a full course of fever therapy as contemplated, and treatment was completed with oral potassium iodide therapy three weeks after the last session of fever. Skin tests with sporotrichosis vaccine were positive, with sporotrichin negative. Results of agglutination tests extending over a six-month period are recorded.

PSITTACOSIS: A CASE IN CAPE COD

Earle M. Chapman, M.D., Boston

Psittacosis, or, better, ornithosis, is rarely encountered in New England. When a woman from Cape Cod entered the Massachusetts General Hospital with a fever of unknown origin of a week's duration, there was little to suggest such a diagnosis. Administration of 900,000 units of penicillin daily for the four days prior to entry had not apparently altered the course of the disease, but it may have affected later diagnostic procedures.

REPORT OF A CASE

History.—K. R. D., a woman, 61, had been leading an active life until May 31, 1950, when she felt exhausted; in a few hours severe headache and a fever of 102 F. with frequent small chills developed. The headache was frontal and occipital, and, in addition, there was generalized muscular pain, partially relieved by administration of acetylsalicylic acid (empirin®). The neck had not been stiff. After the onset the patient was continuously febrile, the temperature varying between 100.5 and 104.0 F., except after use of acetylsalicylic acid (aspirin) and acetophenetidin (phenacetin), which caused profuse sweats and decline of temperature to normal for a short time. Later she had several severe shaking chills. A slight cough produced mucoid sputum only. Moderate pain in the low anterior side of the left chest troubled her for two days before hospital entry on June 8.

The background history contributed very little, although the following data were suggestive of certain disease patterns:

1. Urgency and frequency of urination for years, at irregular intervals, had been attributed to cystitis, and intermittent treatment with sulfadiazine and silver nitrate irrigations had not effected a cure.

2. One month before the onset of fever an abscessed tooth had been extracted without any known reaction.

3. The night before the onset of fever the patient had a small pustule on the left cheek, which she punctured with an unsterilized needle.

4. The patient had been living at Falmouth, Cape Cod, where ticks abound. She had seen ticks on her body, but none attached.

Physical examination showed a feverish woman lying flat in bed in no great discomfort. She was talking freely and complaining of slight pain laterally in the left side of the chest. She coughed lightly at frequent intervals and raised mucoid sputum. The skin was clear. A few crepitant rales were heard in the low left-axillary line after she coughed. Otherwise, the examination, made by several physicians, disclosed no abnormalities.

Clinical Associate, Harvard Medical School, and Associate Physician, Massachusetts General Hospital.

Hospital Course and Investigations.—The only possible diagnosis was a fever of unknown origin. Virus pneumonia, infectious hepatitis, enteric fever, pyelonephritis, subacute endocarditis, and rickettsial disease were all suspected. The first study was a roentgenogram of the chest, which revealed an atelectatic area in the left upper lobe and also some strandlike density in this region. A small amount of fluid at the left lung base and slight atelectatic changes within the posterior basal segment of the left lower lobe were present. The radiologist suggested that bronchoscopy be done to exclude a bronchogenic carcinoma.

Aerobic and anaerobic cultures of blood were taken; blood for agglutinations for the enteric fevers were drawn, and a catheterized urine specimen was obtained. The urine showed an occasional white blood cell and two red blood cells per high-power field. Later, only Escherichia coli was found in the urine. Tuberculin diluted 1:100,000 was injected intradermally on June 9; 48 hr. later there was no reaction. The white blood cell count was low, 6,400 and 8,100 and the differential pattern normal. There was no rash, and the spleen was not palpable.

The second hospital day it seemed that ornithosis-psittacosis could well explain the clinical course of fever and the atypical pulmonary changes. The patient had not had direct contact with birds but had twice cleaned a bird-feeding station kept in the garden. An injection of sputum into mice by the intraperitoneal route was planned with Dr. John Enders at the Children's Hospital in an attempt to establish the diagnosis. On the afternoon of June 13 this was accomplished with a small amount of tenacious, grayish, mucoid sputum that had been raised that morning.

Serologic tests for Q fever, typhoid, and typhus were reported negative in all dilutions. Stool cultures were negative for pathogens. A rapid sedimentation rate continued; yet, the white blood cell count remained about 8,700 per cubic millimeter.

Chloramphenicol (chloromycetin®) therapy was begun with the administration of 0.5 gm. by mouth on June 13 (a total of 2.0 gm. was given the first 24 hr.) and continued with the administration of 1.5 gm. daily for four successive days. The temperature dropped from a level of 103 F. to normal on the morning of June 14 and remained normal until discharge from the hospital on June 23. On June 19 a second chest x-ray showed no appreciable change, and neoplasm still remained a distinct possibility.

On June 20 Dr. Enders reported that three of the 10 mice oculated had died. Numerous intracellular bodies were seen smears of the spleen, which stained red with Macchiavello's and were morphologically similar to the elementary bodies of psittacosis. Splenic tissue from these animals was inoculated into another group of mice. Death ensued within three to four days, and again the morphological findings were compatible with the diagnoses of infection with Miyagawanella psittacii. The causative agent of the infection in the mice, however, was not further identified. The four cultures of blood taken at the time of entry revealed no growth. Two of these were with added penicillinase. Sputum cultures for Mycobacterium tuberculosis were negative.

The patient continued to feel tired and listless, but on the day of discharge, June 23, the lungs were clear to percussion and auscultation. The spleen was not felt, and the cough had disappeared. The patient was urged to rest in bed at home.

Convalescence.—For the next three weeks at home the patient was fatigued and weak; on July 17 roentgenographic reexamination of the chest revealed considerable resolution of the upper left-lobe process, with only minimal evidence of residual infiltration. The findings now were suggestive of a clearing nonspecific pneumonitis. Because of continued fatigue and malaise, but without fever, another course of 1.5 gm. daily of chloramphenicol was given from Aug. 13 to 16.

On Aug. 11 it was reported[1] that blood serums drawn June 12 showed positive agglutination for psittacosis in dilution of 1:8 and for June 17 in dilution of 1:6; serums drawn June 23 and July 17 were negative.

I visited the patient at home on Aug. 31. She was tired and complained of vague aching in her muscles. This continued through September but subsided during October. The patient had always been physically vigorous and found the continued inability to get about and see visitors very trying.

The bird-feeding station was a covered platform wi glass sides. When the patient was cleaning it, the d and disintegrated bird-droppings had been brushed t ward her with a strong whisk. During the period wh infection might have occurred, a family of purple finch were frequent visitors to the station. Finches are know to be carriers of psittacosis. In the course of the summ a catbird, a robin, and a finch were found dead b showed no signs of injury. Sea gulls inhabit the near shore, but contact with gulls was unlikely. This case psittacosis in Cape Cod recalls the astute researches R. K. Rasmussen[2] in The Faroes, where he identifi epidemic alveolar pneumonia with psittacosis and relat the source of infection to the fledglings of the gull F marus glacialis.

In conclusion, certain clinical features might be e phasized: Psittacosis, by definition an avian infection communicable to man from many species of birds. T diagnosis of psittacosis is best established by the cult of the virus by inoculation of citrated blood or sput into mice.[3] The presence of only minimal clinical si of pulmonary disease, compared with the changes sho by roentgenogram, is a unique feature of this avian inf tion. Another feature is the prolonged convalesc period, despite the disappearance of fever after treatm with chloramphenicol.

MYCOTIC ENDOCARDITIS

REPORT OF A CASE

E. I. Wolfe, M.D.†
and
F. William Henderson, M.D., Wilkes-Barre, Pa.

Within the past few years, several cases of myc endocarditis have been reported, as well as one cas blood stream invasion in which treatment with sul amides and penicillin was unsuccessful.[1] Because of rarity of this condition and because of several othe teresting factors, we feel that this case is worth report

REPORT OF CASE

History.—Mrs. F. G., 57, a housewife, separated from husband, was admitted to the medical service of the Wi Barre General Hospital on Sept. 2, 1949, because of na

vomiting, chills, and fever of two days' duration. Prior to this, she had been feeling ill; she stated she had had a cold with cough and lack of appetite. She was a known diabetic since January, 1949, and the diabetes was controlled on 15 units of protamine zinc insulin and 30 units of regular insulin daily. When she became ill, she took only 15 units of the protamine zinc insulin and ate only small quantities of food. Nevertheless, her fractional urinalysis showed no evidence of sugar. Her family physician suspected diabetic acidosis and sent her to the hospital for study.

Her past history and systemic review were noncontributory. She had always enjoyed good health except for cutaneous ulcers (etiology unknown) of the abdomen in December, 1948, and diabetes, which was discovered in January, 1949. The latter condition, however, was apparently well controlled since that time. Family history was irrelevant except that one sister died of "goiter" trouble and another of poisoning from "dyes."

On admission, the patient's temperature was 104 F, pulse rate 130, respiratory rate 28, and blood pressure 100/65. She appeared very toxic, wan, and somewhat apathetic. The positive physical findings were as follows: a dry scaly skin with several small scars on the abdomen due to healed superficial ulcerations. Four carious teeth were present with evidence of pyorrhea. She had a mild right scoliosis and kyphosis. Breath sounds were diminished over the right chest posteriorly, and in this area, inspiratory rales were heard. The heart was not enlarged to percussion. The rhythm was regular. A grade 3 systolic apical murmur and a grade 3 systolic pulmonic murmur were present. On admission no masses or organs were felt in the abdomen except the liver, which was approximately 1 cm. below the right costal margin. Moderate left costovertebral angle tenderness was noted. The pulses of the lower extremities were decreased, and slight right calf tenderness was elicited. Reflexes were hypoactive. A pelvic examination performed by a surgical consultant showed a small, tight vagina, atrophic uterus, and no pelvic pathology. Later, however, a repeat examination revealed evidence of a mild fungus infection of the labia minora.

Course.—On the day of admission, the patient complained of the right foot "going to sleep," associated with pain in the popliteal area and the calf. An embolic phenomenon with associated venospasm were suspected, and treatment with bishydroxycoumarin (dicumarol®) was begun. This was continued about three weeks, then discontinued when improvement in the leg occurred. At this time, although no dorsalis pedis pulse was present, no other circulatory changes were in evidence.

The clinical impression on admission was that the patient had either pneumonia or endocarditis. Before penicillin (50,000 units given intramuscularly every three hours) was begun, a blood culture was obtained. The first chest roentgenogram did not confirm our diagnosis of pneumonia, and it was not until three months later that the roentgenogram showed any evidence of pulmonary disease, at which time pulmonary edema and fluid in the right base was present. The patient's diabetic state never got out of control, and she was well maintained on 10 units of protamine zinc insulin daily plus a calculated diet.

As time went on, she continued to have a fever, complain of weakness, and show no signs of improvement. Numerous diagnostic studies were performed, including a complete gastrointestinal series (which showed a chronic inactive duodenal ulcer), roentgenographic examination of the skull and long bones, cystogram, intravenous urogram, and retrograde pyelogram. The kidney studies showed evidence of a left pyelonephritis confirmed by urine examination and cystoscopy. It is interesting to note that the original smears and cultures from the left kidney showed yeast cells (which were not considered important) and Aerobacter aerogenes. Treatment, therefore, was directed toward the latter finding.

Meanwhile other important studies were performed. The electrocardiogram was reported as normal. The serological test for syphilis was normal, as were the original blood cultures, Widal test, Brucella agglutination tests, spinal fluid examination, smears for malaria, bone marrow biopsy, and histoplasmin, coccidiodin, and blastomycin skin tests.

The patient showed a persistent microcytic type of anemia (hemoglobin 50% with 2,000,000 red blood cells) despite five blood transfusions of 500 cc. each. The white blood cell count and differential were essentially normal, but the sedimentation rate remained high, 15 to 33 mm. in one hour with a first zone curve. The urine was alkaline the greater part of the time, always showing albumin, a trace to a heavy cloud, with 1 to 10 red blood cells, 6 to 30 pus cells, and many bacteria; on occasion, yeast cells were noted on smears.

A total of 10 blood cultures were done, and three of these showed a Staphylococcus pyogenes albus and yeast, both considered to be contaminants. The first growth of yeast occurred in the fourth specimen taken on Nov. 14, 1949, and was present in all others thereafter.

Still suspecting a pyelonephritis as the primary source of the "bacteremia" and disregarding the yeast cell finding, we instituted numerous therapeutic trials of antibiotics and sulfonamides. On Oct. 4, 1949, the possibility of a perirenal abscess was considered, and perirenal paracentesis was performed, but the results were negative. The patient during this three month period, received penicillin in massive doses (43,000,000 units), including 5,000,000 units given intravenously daily during the three days before death. She also received aureomycin (7.5 Gm.), dihydrostreptomycin (28 Gm.), gantrisin® (3,4-dimethyl-5-sulfanilamidoisoxozole) (40 Gm.), sulfamerazine, and sulfadiazine (36 Gm.) at varying intervals.

Unfortunately, despite intensive antibiotic therapy and supportive therapy, the patient did not respond. By Nov. 18, 1949, numerous petechiae were noted over the abdomen, back, neck, arms, face, and conjunctivas. Tenderness in both upper abdominal quadrants was present, and the tip of the spleen was palpable. Pronounced disuse atrophy of both extremities had also occurred. Toward the end, the murmurs heard over the precordium were of less intensity, the rales in the right base increased, and the patient became uncooperative and delerious. Fuid intake and output became nil, and she died, after a very short convulsive seizure, on Dec. 9, 1949.

Autopsy.—Only the pertinent gross and microscopic findings are presented. When the thoracic cavity is opened, the right lung is found adherent to the parietal pleura. The upper lobe is covered with thick fibrinous adhesions. On section, the surface is reddish pink in color, and on pressure, air, blood, and fluid escape. The middle lobe is also reddish pink in color, but very little air, blood, and fluid escape on pressure. The lower lobe is similar in appearance and covered with adhesions, but is partially collapsed.

The surface of the left lung is smooth and reddish pink in color; a similar color is noted on section. The lung itself is partially collapsed and somewhat leathery in consistency. On pressure, a small amount of blood, fluid, and air escape. The bronchi and trachea are patent throughout. The mucous membranes are pale, and a small amount of mucus is present within the lumina. The adjacent mediastinal lymph nodes are few in number, small, and blackish in color.

The heart is in the midline, the apex occupying the fifth interspace. The heart is of normal size and is covered with a moderate amount of epicardial fat, which is injected. In the pericardial sac, there is a small amount of clear fluid. The myocardium of the left ventricle averages 1.4 cm. in width; aortic valve 7 cm.; pulmonary valves 6½ cm.; tricuspid valves 7 cm. in circumference. The papillary muscle is thickened, and the chordae tendineae are thin. The valves in general are leafy and supple. Above the leaflets of the mitral valve, there is a large, white soft fungoid growth measuring 3 by 1 by 0.5 cm. On the valve leaflets proper are two similar small projections each measuring approximately 6 by 0.2 by 0.2 cm. The orifices of the coronary vessels are patent, and the left descending artery shows a few fatty plaques. The right coronary artery is slightly thickened, but the pulmonary artery is smooth and patent throughout. The aorta above the valve is not dilated, and fatty plaques are noted throughout its length.

When the abdominal cavity is opened, the liver is noted to be 6 cm. below the costal margin. The other organs are in normal position, and the peritoneal surfaces are smooth, moist, and glistening. The liver is enlarged and measures 27 by 25 by 8 cm. The capsule is slightly thickened. The surface is reddish in color, but several small pinpoint whitish areas are present. On section, the liver is dark brown in color with multiple foci of apparent hemorrhage. The lobules are not distinct.

The uterus, tubes and ovaries show senile atrophy. The vagina appears injected, as does the surface of the uterus. On section, the mucous membrane of the vagina is pale, and a small amount of mucus is present.

The left kidney measures 10 by 3.5 by 2.5. cm. The outer surface shows fetal lobulations, and the capsule strips easily in some places, but with difficulty in others. Numerous small petechial hemorrhages are seen beneath the capsule. On section, the cortex and medulla are poorly differentiated. The parenchyma is pale. The calyces are slightly dilated and contain a small amount of yellowish, cloudy urine.

The right kidney measures 11 by 4.5 by 5 cm. Fine scarring is noted on the outer surface. The capsule strips with difficulty, and numerous petechial hemorrhages are noted beneath it. On section, the medulla and cortex are fairly well differentiated. The parenchyma is darker red than in the left kidney, and although the pelvis is slightly dilated, the urine present does not appear abnormal. The ureters are patent and normal throughout.

The spleen is enlarged three times its normal size, weighing 720 Gm. and measuring 18 by 10 by 7 cm. On the outer surface, which is smooth, can be seen three areas approximately 2 cm. in diameter which are lighter in color than the surrounding tissues. On section, the tissue is deep red in color, and the pulp scrapes easily with a knife.

The bladder is contracted; the mucosa appears thickened, roughened, and reddened. A small quantity of reddish tinged purulent urine is present.

Microscopic examination revealed the following: Lungs: The vessels present appear thin-walled. Some of the alveoli contain red blood cells and large pigmented macrophages. Other alveoli are collapsed; some appear fragmented, and the capillaries are surrounded by fibrous tissue. Around some of the bronchioles are foci of lymphoid cells. A few small areas of fibrous scarring and anthracotic granules also occur.

Heart (Mitral Valve): The growth on the mitral valve is composed of clumps of yeast-like cells and hyphae. The underlying tissue is fibrous and contains a few capillaries. In the heart muscle beneath the valve are found small foci of what appear to be yeast cells and lymphoid cells. In a second section from the mitral valve are poorly preserved yeast cells in a large mass on the outer portion of the valve. In the underlying brous tissue are plasma cells, lymphoid cells, a few macroages, and numerous capillaries. In sections taken from other arts of the heart are found foci of lymphoid cells and yeast cells as well as a few large macrophages. The nuclei of the cardiac muscle are fairly regular in size and shape.

Liver: Most of the liver cells appear well stained and contain bile pigment. A few foci of lymphoid cells and apparently small yeast cells occur. Lymphoid cells are also noted around the ducts. The capillary spaces are slightly dilated.

Spleen: The lymphoid follicles are small and few. Hyalin change is present in the centers of most of them. The walls of the sinuses are not distinct, and within the lumina are large masses of large round cells, plasma cells, lymphoid cells, red blood cells, and a few polymorphonuclear leucocytes. In some of the small vessels is a subendothelial hyalin formation with thickening of wall and narrowing of lumina. In some sections, areas of necrotic tissue and apparent yeast cells are found. A second smaller area shows partial necrosis but no yeast cells. Epithelioid cells and lymphoid cells are present.

Kidney: In the cortex are foci of fibrous scarring with hyalin glomeruli and lymphoid cells. Slight fibrosis is observed in the capillary tufts of a few glomeruli. The vessels appear thick-walled, and extravasated blood is found in the lumen of many tubules. In one area is a focus of lymphoid cells and what appear to be yeast cells. Beneath the epithelium of the pelvis are several foci of lymphoid cells. The latter also appear in the peripelvic fat. In one section of the kidney is found a g number of glomeruli showing hyalin degeneration. The vessels in this area also appear thick-walled.

Stomach: The mucosa is well preserved. Although no y cells are observed, in the muscularis around one of the ves is found a focus of lymphoid cells.

Bladder: The epithelium of the bladder is well preser Beneath it are noted large foci of lymphoid cells but no ap ent yeast cells.

Vaginal Wall: The epithelial lining is intact, and bene it are noted a few lymphoid cells and polymorphonuclear le cytes. No yeast cells appear to be present.

Pathological findings, in addition to a history of diabetes, as follows: (1) mycotic endocarditis of the mitral valve w foci of infection in myocardium, liver, spleen, and kidneys; splenomegaly and granuloma; (3) hepatomegaly; (4) chro pyelonephritis with slight intercapillary fibrosis and hemorrh in tubules; (5) chronic cystitis; (6) chronic vaginitis; (7) cong tion of all lobes of the lungs; chronic pleuritis of lungs; atrophy of pancreas and hyalin change in islands of Lang hans; (9) scoliosis of the lumbar vertebra, and (10) edema the ankles.

Mycologic studies revealed that smears taken at the time autopsy from the mitral valve, bronchi, and kidneys all sho yeast cells similar to those cultured from the blood of the pati during life. A specimen of this fungus was sent to Dr. Norm F. Conant of Duke University, who reported it to be Cand krusei.

COMMENT

In reviewing the literature, we were able to find six reported cases of mycotic endocarditis: those m tioned in Wikler's article and one reported by Luttge In all these cases, the patients were drug addicts used the drug intravenously. Studies were done Emmons at the National Institute of Health in orde determine if the fungus causing the endocarditis in of the patients were caused by a contaminant in heroin or its adulterants.[1a] No definite proof of this established.

Other possible sources considered were the pati mouth, intestinal tract, and vagina, since Candida sp *may be cultured from these locations in 35 to 40* normal persons.[2] Despite the fact that the cause of mild fungus infection noted on the external genital our patient was not identified by smear or culture, we that it may possibly have been the source of the tagion. We know that this particular fungus (Can krusei) has been found in certain patients with without complaints of pruritus vulvae.[3] It is also known that diabetes predisposes to mycotic vaginitis that even with the aid of the laboratory, differentia between primary and secondary invaders is difficul that we may treat what we think is the offending or ism, only to allow the other greater leeway to cause ther damage.[4]

Just how the organism managed to enter the bo still a matter for conjecture, but knowledge that this tient used insulin daily gives us every reason to feel contamination of the syringe, needle, or even the ins may have taken place.

This case emphasizes the importance of mycotic in tions and the need for some adjustment of our clin concepts concerning them. Therefore, it is felt tha illness of this type should be considered when adeq antibiotic therapy has been employed with no respo Thus far, present known powerful antibiotics, as dem strated by our case, have no effect. Recently, howe

3. Jones, C. P.; Carter, B., and others: Mycotic Vulvovaginitis and the Vaginal Fungi, Am. J. Obst. & Gynec. 54: 738 (Nov.) 1947.

4. Smith, D. T.: Fungus Diseases Encountered in General Hospital Practice, Am. J. Med. 2: 594 (June) 1947.

Swart and his associates have isolated a new antibiotic which seems to have antifungal properties.[5]

The case we have reported also emphasizes the importance of consideration of mycotic infections in the differential diagnosis of obscure febrile conditions. This diagnosis can be made by recovery of the causative organism in body fluids, exudates, or purulent discharges, or by biopsy of suspected tissue.

This case further illustrates the necessity of more careful sterilization technique when parenteral medication is being administered by untrained personnel. Finally, we are impressed with the danger of ignoring laboratory reports of yeast cells—considering them as contaminants.

In general, we must assume that the increased quality and quantity of antibiotics and chemotherapeutic agents available to the average patient have produced a changing pattern in the progress of diseases due to infections. We can confidently expect that further advances in therapy will result in continued changes, which will challenge our judgment and clinical appraisement.

SUMMARY

A case of disseminated moniliasis, with autopsy findings, is reported. The etiologic agent was Candida krusei. This is the first reported case of mycotic endocarditis in a diabetic and also of endocarditis due to Candida krusei. Although the prognosis remains hopeless in cases of mycotic endocarditis or meningitis, there is some hope that specific antibiotics may be available. Physicians should be alert to the possibility of fungus infection and never ignore or minimize the presence of yeast cells in cases in which that possibility exists.

CARDIAC ARREST

COMPLETE RECOVERY AFTER TWENTY-FIVE MINUTES

Max G. Carter, M.D., New Haven, Conn.

Total cessation of the heartbeat during a surgical operation presents a crisis demanding direct action. Correct treatment requires previous planning for action in the event of such an accident, as well as knowledge of the probable causes of cardiac arrest. It is generally agreed that there are two principle factors, either one or both of which are usually responsible for the onset of cardiac standstill: first, excessive manipulation of the heart itself or of the pulmonary hilar structures during thoracic surgery; and second, myocardial hypoxia due either to generalized arterial hypoxia or to direct occlusion of one or more coronary vessels by internal damage or external pressure.[1] The case of cardiac arrest presented here is of interest because the patient had a markedly diminished pulmonary reserve, which had been measured objectively prior to thoracic surgery; this patient was one, therefore, in whom complications were felt to be more likely than is usual. After cardiac arrest supervened during surgery, resuscitation was effected by commonly established measures, to which was added occlusion of the thoracic aorta. The successful use of aortic occlusion in a human being, first suggested by Wiggers,[2] does not seem to have been reported previously.

REPORT OF CASE

History.—G. B., a white man aged 63, was admitted to Boston City Hospital with chief complaints of coughing of blood, weight loss, and increasing fatigue. He gave a history of increasing thoracic complaints over the preceding 15 years. These had consisted of asthma-like attacks with dyspnea, orthopnea, and wheezing, together with frequent respiratory infections. He produced approximately a half cup of yellowish, nonfoul sputum daily. A significant cough occurred only with episodes of pulmonary infection. Eight months prior to his admission, the first hemoptysis had occurred. Thereafter there were repeated episodes of blood-spitting with an intermittent left anterior chest pain becoming worse with respiration, an increase in cough, and a weight loss of 26 lb. (11.8 kg.) in spite of no change in appetite or food intake. There was no history either of tuberculosis itself or of contact with it.

Physical Examination.—The patient was well-developed but showed obvious weight loss, chronic illness, and moderate dyspnea when resting. There was some clubbing of the fingers. The thorax was increased in anteroposterior diameter, and the breath sounds were of diminished intensity. Diaphragmatic motion was decreased. There were numerous wheezes and rhonchi, which cleared on cough. There were dullness and marked diminution of the breath sounds over the left lower lobe. No rales were heard. The blood pressure was 190/100; cardiac rate, regular at 88 beats per minute; rectal temperature, 100.6 F.; respiratory rate, 20.

Laboratory Data.—On admission the hemoglobin value was 14 gm.; white blood cell count, 18,500; hematocrit reading, 47; and the differential blood count revealed 76% polymorphonuclear leukocytes, 22% lymphocytes, and 2% eosinophils. Three sputum concentrations were negative for acid-fast bacilli. Sputum cultures taken prior to the institution of antibiotic therapy revealed alpha hemolytic Streptococcus, Neisseria flava, and Micrococcus catarrhalis. Tentative diagnoses of bronchogenic carcinoma, pulmonary emphysema, hypertensive heart disease, and possible bronchial asthma were made.

Further cardiovascular evaluation revealed a venous pressure of 110 mm. of water; circulation time, arm to lung, six sec. (ether); arm to tongue, 12 sec. (magnesium sulfate). The electrocardiogram was interpreted as being probably within normal limits. Bronchoscopy revealed a fungating tumor growing in the left lower lobe bronchus. The remainder of the tracheobronchial tree was normal. A tissue biopsy was not diagnostic, but suggested carcinoma. A Papanicolaou smear obtained from the same bronchus was reported positive for carcinoma cells.

Pulmonary physiologic studies revealed a maximum breathing capacity of 38 l. per minute, a walking ventilation (Warring) of 19 l. per minute, and a vital capacity of 2,600 cc. After isopropylarterenol (isuprel®) hydrochloride inhalation the maximum breathing capacity remained at 38 l. per minute and the vital capacity had increased only 60 cc., thus excluding genuine asthma.[3] Fluoroscopy revealed the trachea and mediastinum to be in the midline; the right diaphragm moved approximately 60% of normal, the left diaphragm was not visible because of left lower lobe "atelectasis." The rib motion was 50% of normal bilaterally, and no air-trapping was visible on either side. Posteroanterior and lateral roentgen examinations of the chest confirmed the fluoroscopy and revealed a density occupying the

normal position of the left lower lobe with good aeration of the upper lobe and its lingula. The right lung was normal except for obvious pulmonary emphysema.

Preoperative Course.—After his admission to the hospital, the patient was given penicillin, both intramuscularly and by aerosol inhalation. His temperature returned to normal and cough and sputum decreased; at the time the pulmonary physiological studies were performed he was considered to be in optimum physical condition consistent with his disease. Two weeks after his admission, pneumoperitoneum was instituted in an effort to increase the patient's pulmonary efficiency.[4] After two refills on successive weeks, repeated pulmonary physiological studies showed his maximum breathing capacity to have been decreased by 4 l. per minute. Nevertheless, the patient observed that his cough was more effective than formerly.

It was felt that, in spite of the low pulmonary function, the patient could tolerate removal of the nonfunctioning left lower lobe. The bronchus to this lobe was obstructed by a tumor, and the suppuration distal to this obstruction presented adequate indication for surgery. No further pneumoperitoneum refills were given, but sufficient intra-abdominal air remained to provide an increased tussive force postoperatively. The danger of operation and the necessity for maintaining a high arterial oxygen saturation at all times were recognized and carefully discussed with the anesthetist.

Operation.—Four weeks after the patient's admission to the hospital an exploratory thoracotomy was performed. With the patient under endotracheal gas-oxygen-ether anesthesia and in the right lateral decubitus position, his chest was opened through the bed of the left sixth rib. The left lower lobe was found to be densely adherent over the posterolateral and diaphragmatic surfaces. There was moderate blood loss due to the many adhesions, but the dissection progressed readily until the lobe was entirely free. During this dissection there were many secretions that the anesthetist removed by careful endotracheal suction for short periods followed by positive-pressure oxygen insufflation. After one such period of endotracheal aspiration, the patient's color became very dark. At this point the heart was seen to slow gradually and come to a complete stop. Cardiac massage was immediately begun, the surgeon squeezing the heart between the thumb and fingers of his left hand at a regular rate, approximately 50 to 60 contractions per minute. At the same time the sthetist continued positive-pressure oxygen insufflation at a r rate. Neither a pulse palpable in the radial arteries nor ctable blood pressure was present for the first few seconds. his right hand the operator then manually compressed e aorta distal to the take-off of the left subclavian artery. After this maneuver a perceptible pulse was present at both wrists and a blood pressure of approximately 60 mm. Hg systolic was clearly audible. Two cubic centimeters of epinephrine, 1: 1,000, was injected into the left ventricle. Cardiac massage was continued, but no cardiac beats were felt. Fifteen minutes after the onset of cardiac arrest, 2 cc. more of epinephrine was injected, 1 cc. into the left ventricular myocardium and 1 cc. into the ventricular chamber. A few feeble contractions began while massage was continuing. Procaine hydrochloride totalling 100 mg. was given intravenously by the anesthetist in divided doses approximately 10 min. apart. Within five more minutes the heart had resumed a normal but somewhat weak rhythm. Cardiac massage was therefore discontinued, 25 min. after the onset of complete cardiac arrest. The rib spreading retractor had been removed when cardiac arrest first became apparent. The maintenance of massage at an adequate rate of around 50 to 60 contractions per minute was so fatiguing that the surgeon and the first assistant alternated for periods of five minutes each. The occlusion of the aorta distal to the subclavian artery was maintained throughout the period of massage, and gradually discontinued as the heart began its normal rhythm. The resection was then abandoned, and thoracic closure, with continuous sutures to all layers, was made rapidly. The patient was turned on his back, and endotracheal aspiration was made through the bronchoscope while a heavy flow of oxygen was maintained. After thoracic closure, the patient's blood pressure rose to 132/68; his pulse was somewhat irregular but strong, and his color was normal. During the procedure, a gradual transfusion of 2,000 cc. of compatible whole blood had been given.

Postoperative Course.—The patient recovered satisfactorily, and an electrocardiogram on the day following surgery was interpreted as revealing "a sinoauricular tachycardia, probably within normal limits." Recovery was uneventful. The patient was able to cough secretions with moderate force. Two thoracenteses were necessary to evacuate serosanguineous fluid, but his wound healed well. Careful examination by each of the physicians who had seen the patient preoperatively revealed no change in his physical or mental status, and he was discharged from the hospital on the 11th postoperative day.

COMMENT

Experience with this patient clearly illustrates the direct effect of arterial hypoxia on the myocardium. Kergin, Bean, and Paul[5] have used the electrical oximeter to demonstrate the fall in arterial oxygen saturation that follows excessively vigorous endotracheal aspiration during anesthesia. The patient described in my paper was known to have a very narrow pulmonary reserve. In spite of this, his condition on the operating table remained stable while aspiration of his airway was done at frequent intervals for short periods. Immediately before cessation of heart action, one episode of endotracheal aspiration had been much longer and more vigorous than any preceding aspirations. After this aspiration and prior to the cessation of the heartbeat, both skin and blood appeared to be of an extremely dusky hue that was noticed by both the anesthetist and the surgeon. The vagus nerve[5] was probably also stimulated by the hilar dissection.[6] Some form of oximeter would have been a valuable adjunct in detecting arterial hypoxia before the critical point was reached.

The fatal effect of prolonged cerebral anoxia is well known. Experience with this patient also illustrates how an effective cerebral and coronary blood flow may be maintained, even with the markedly diminished cardiac output produced by manual massage, if no effort is made to maintain circulation to the entire organism. Occlusion of the aorta distal to the origin of the subclavian artery for relatively long periods has been shown to be harmless.[7] That this maneuver will also maintain an effective cerebral and coronary blood flow is now well established, although the experimental report of Johnson and Kirby[8] had not been published at the time this patient was seen. Postoperatively there was no immediate evidence of cerebral damage. The patient was examined again six months after discharge; at that time he was mentally sound and as alert as at the time of operation. In the intervening months there had been several episodes of severe pulmonary infection due to the obstruction caused by the tumor; but symptoms had been palliated by antibiotic therapy.

SUMMARY

A case of cardiac arrest in which the heart was in complete standstill for 25 min., occurring in a patient during intrathoracic surgery, is reported. Life was maintained by artificial respiration and cardiac massage. An adequate

cerebral and coronary blood flow was secured by manual occlusion of the aorta distal to the left subclavian artery while cardiac massage was performed.

It is suggested that this maneuver should be used in all cases of cardiac arrest.

The reported case is evidence in confirmation of the thesis that vigorous endotracheal aspiration produces arterial hypoxia and may be a cause of cardiac arrest in a patient with pre-existing pulmonary deficiency.

FULL-TERM ABDOMINAL PREGNANCY

REPORT OF TWO CASES

R. J. Burleson, M.D.
and
J. C. Bragg, M.D., Decatur, Ala.

There have been several complete surveys of the literature concerning abdominal pregnancy. Hellman and Simon[1] reported 316 cases of intra-abdominal pregnancy. They included a series of fetuses from 22 weeks' gestation to term. The number of live births was 158, and the number of mothers surviving was 212. There were probably only 50 cases in which mother and baby were entirely well. Gardner and Middlebrook[2] reported 22 other cases, and in only one case in the series was there a full-term surviving infant with no congenital anomalies or deformities and a surviving mother. In 1946, Beacham[3] recorded 20 additional cases from the records at Charity Hospital, New Orleans, and, of the 20 cases, only nine were at term; and, further, there were only two live babies. From 1946 through 1948, approximately 49 additional cases have been reported in the literature. Only 14 of these pregnancies progressed to term, with nine normal living infants. Lee[4] gives a relative idea of the rarity of this condition in a five-year (from Jan. 1, 1940, to Dec. 31, 1944) survey at the Swedish Hospital, Seattle. During this period there were 9,384 deliveries and 615 spontaneous or therapeutic abortions, making a total of 9,999 pregnancies. Of this number there were 58 extrauterine pregnancies and only one abdominal pregnancy (secondary), with a living infant. It is generally conceded that abdominal pregnancy in all its forms occurs about once in 2,300 deliveries.[5] It was felt, therefore, that the two following cases that occurred in our practice in a three-year period would be of interest.

REPORT OF CASES

Case 1.—K. C., a Negro primigravida, 22, was admitted to Decatur General Hospital on Sept. 13, 1947. Her last menstrual period was probably in November, 1946; however, she had continued to have spotting, and this date is not definite. In December, 1946, the patient had acute pelvic pain with chills and fever and was put to bed by the attending physician, who interpreted her condition as "pelvic cellulitis." She was treated with rest and chemotherapy. Convalescence was progressive but slow, and the patient was able to be up only after about six weeks in bed. Pain and soreness in the lower abdomen continued, and she noticed that her abdomen began to enlarge after about three months. The family physician was again consulted, and pregnancy was diagnosed. Fetal movements appeared and were intense. The intensity increased until two weeks prior to the patient's admission to the hospital. When she was seen on admission by one of us (J. C. B.), there were no fetal movements or heart tones. Examination at this time revealed a large, smooth, movable mass in the abdomen, a uterus of normal size with a small, hard cervix, which was displaced high under the symphysis. There was slight mucopurulent discharge but no vaginal bleeding. The position of the fetus was undeterminable because of the pronounced distention, apparently caused by fluid. On Sept. 17, 1947, celiotomy was performed, and a normal-appearing, 8 lb. (3,628.73 gm.) fetus (dead, but not macerated) was removed. The sac and placenta were entirely removed, but hemorrhage from the posterior uterine surface was uncontrolled, and a left salpingo-oophorectomy and hysterectomy (supravaginal) was necessary. This controlled the hemorrhage, and the wound was closed without drainage. The patient had an uneventful recovery after two transfusions of whole blood. She was discharged as recovered on Sept. 25, 1947.

Comment.—This case was definitely an abdominal pregnancy of "secondary" type, with the "cellulitis" that occurred soon after conception probably indicating expulsion of the tubal pregnancy into the abdominal cavity. The placenta was attached to the uterus (posterior surface), the parietal peritoneum of the pelvis, left tube and ovary, the broad ligament, and the sigmoid colon. This pregnancy, from all indications, was post-term, to judge by the 10 months' history and the weight of the baby. Beacham[3] has stated that these patients should be operated on before term and that the damage to mother and infant occurs in the last two weeks of pregnancy. Evidence that fetal movements were present two weeks prior to the patient's admission to the hospital and the fact that the baby was perfectly normal in appearance suggest that, if the diagnosis had been made and surgical measures instituted two or three weeks earlier, a normal live baby might have been delivered in this case as in the second case.

Case 2.—S. S., a Negro primigravida, 34, was admitted to Decatur General Hospital on March 16, 1950. She was sent to the hospital by the family physician because of continued unproductive labor pains of two weeks' duration and a fetus in transverse position. The history gave the last menstrual period as June 16, 1949. There were no noticeable complications or symptoms during the pregnancy according to the patient. Examination revealed a term pregnancy, fetus in transverse position, and normal fetal heart tones. The baby was apparently large and was carried high. The patient had a somewhat narrow pelvis. On the basis of these observations and the unproductive labor ("false labor" usually described in these cases), cesarean section was decided on. On examination prior to surgery, we made the same mistake as Billington and Goodchild,[6] in interpreting the normal uterus as an associated fibroid of the lower segment of the pregnant uterus. With the patient under spinal anesthesia, on March 17, 1950, we began what was intended to be a cesarean section; however, on opening the peritoneum, we saw the sac and fluid. We first wondered, like Bowesman,[7] if "the 'fibroid' was undergoing degeneration." On closer inspection and further dissection fetal parts were seen through the membranes, and these then being opened, a live, normal, full-term, 5 lb. 2 oz. (2,324.66 gm.) infant was delivered. The placenta in this case also was dissected with care away from the broad ligament, in its entirety, and hemostasis was obtained by continued pressure of the assistant's hand over the newly denuded area during the slow deliberate dissection. The placental mass was also attached to the posterior uterus, left ovary, and tube and small sites on the small bowel and its mesentery. It was necessary to remove the left tube and ovary en bloc with the placenta. After removal of the placenta the wound was closed without drainage. The patient was given two transfusions, and both baby and mother were discharged from the hospital, on March 27, 1950, fully recovered. The baby was normal in every respect, and, at the time of the writing of this paper, was still living and healthy.

COMMENT

Beacham[3] states that a fetus in transverse position in a primigravida should be indicative of an abdominal pregnancy until proved otherwise. Therefore, we probably should have known the type of this case before surgery. However, these cases are so rare that, as pointed out in nearly all reports of cases, it is usual that diagnosis is made most accurately during surgery. We cannot speak with authority on the question of removal of the placenta; however, if it can be done readily, this would seem advisable. The use of continued pressure over the denuded areas, with hot packs under the assistant's hand, is credited with much of the success in our control of hemorrhage in the second case. Because this is a rare and dangerous condition, we are grateful for our success in both cases. The two cases parallel each other closely, and if the first patient had been admitted to the hospital earlier, we might have been able to have reported two full-term abdominal pregnancies, with two live normal babies, and living mothers. In the second patient there was no history to indicate tubal abortion or rupture, but because of the location of the placenta, we have assumed that it is, as the first case, secondary in type.

SUMMARY

The literature is superficially reviewed for the number ull-term abdominal pregnancies and subsequent nor l live babies born by celiotomy. Two cases of full-term abdominal cyesis are described, both with normal fetuses, one post-term and dead, the other alive. Both placentas were removed during surgery, and both mothers recovered.

705 Sixth Ave. East.

Immunity in Leprosy and Tuberculosis.—BCG administered orally in repeated doses seems to be effective in turning the results of the tuberculin and lepromin tests to positive in patients who previously had been negative to both tests. Souza Campos and associates recommended repeated BCG oral vaccinations for all children of leprous parents during the first days of life as a prophylactic measure, and they suggest that the positive Mitsuda reaction brought about by the oral administration of BCG may be connected with the immunity process of tuberculosis and independent of the process of hypersensitivity.

The practical conclusion that we may draw from these interesting studies is that we are facing the possibility of mass immunization of children against leprosy in those countries highly affected by this disease, and that, although this immunity may not be absolute, the type of leprosy which might develop among some of these children would be of the tuberculoid type, i. e., of benign, practically noninfectious character. This may result in time in a great reduction of the incidence of leprosy and its eventual eradication.—V. Pardo-Castello, M.D., Cross Immunity in Leprosy and Tuberculosis, *International Journal of Leprosy,* April-June, 1951.

SPECIAL ARTICLE

Statement by the Committee on Emergency Medical Care of the American Diabetes Association, Inc.

Membership of the Committee on Emergency Medical Care: Franklin B. Peck, M.D., Indianapolis, Chairman; Charles H. Best, M.D., Toronto, Ontario, Canada, Insulin Supplies; Henry B. Mulholland, M.D., Charlottesville, Va., Chairman, Subcommittee on Treatment; William H. Olmsted, M.D., St. Louis, Chairman, Subcommittee on Nutrition; Edward L. Bortz, M.D., Philadelphia, Liaison with Other Agencies; Lester J. Palmer, M.D., Seattle; John A. Reed, M.D., Washington, D. C., and J. Richard Connelly, New York, Secretary.

EMERGENCY MEDICAL CARE OF DIABETICS IN CIVILIAN DEFENSE

The American Diabetes Association has been considering since August, 1950, the problem of emergency medical care for diabetics in case of disaster. On Dec. 4, 1950, the Committee on Emergency Medical Care was formed, and since then its activities have been given top priority by the association. The need for adequate measures to provide for the health and welfare of the one million known (and estimated one million unknown) diabetics in this country as part of the national security program is recognized by the association. Approximatel 70% (700,000) of the diabetics in the United State take insulin daily. Many of them would die in a short tim if insulin were not available. The need for prompt an effective treatment of casualties among this group woul become particularly critical in event of a major catastrophe, since they would be utterly dependent on a continuing and possibly increased supply of insulin to prote them from acidosis, coma, and certain death. Provisio for adequate care of diabetics should be a definite facto in any emergency mobilization activity. All medical, surgical, and pediatric conditions presenting dietetic and nutritional problems among the diabetic casualties an evacuees should be foreseen, as well as the general problems precipitated by national emergency conditions.

Diabetics can also play as important a role in tot emergency mobilization as nondiabetics. Although, generally speaking, they are not eligible for military service, they are employable and form an integral part of th total manpower reserve. Furthermore, they have a facilit in the use of hypodermic medication which makes them invaluable in caring for other diabetics and as auxiliar nursing aids. Maintenance of their health and morale i consequently, a vital necessity. Their morale and that o their families will best be sustained if adequate measures are taken for their protection. The committee's primar responsibilities in approximate order of importance hav therefore been to study and plan along these lines: Insulin storage, supply, and distribution in both target an nontarget areas; medical treatment of diabetics in an major emergency; nutrition for the diabetic population and dissemination of information concerning care of diabetics in emergencies.

Present plans involve maintenance of close liaison with the ultimate government authority in civil defense. Two conferences have been held in Washington with governmental agencies, including the United States Public Health Service, Federal Security Agency, National Security Resources Board, Federal Civil Defense Administration, and others interested in the problem. The association is keeping in close touch with these agencies and is also working with the Council on National Emergency Service of the American Medical Association and the National Health Council. Present activities include planning with the federal government to assure adequate production of insulin and methods of distribution, including adequate dispersal and protection of the present insulin inventory; establishment of temporary production lines in the event of destruction of equipment; and consideration of means of providing for a continuing and adequate flow of cattle pancreas glands. The Subcommittees on Nutrition and Treatment are gathering data for incorporation into the total defense program. These studies encompass types of insulin, nutrition, simple methods of urine and blood sugar testing, treatment of burns, synthetic plasma substitutes, management of hospitalized diabetics, training of personnel, and other problems.

Plans for the future call for full activation of the program in all its details and any other items which later may be considered advisable, utilizing any and all authoritative channels and sources.

INSULIN SUPPLIES

With the cooperation of the insulin manufacturers of the United States and Canada, data have been assembled concerning the present inventories of insulin, their distribution and storage, and the prospects for maintaining supplies in event of wartime disaster. Many of these facts have been given to Dr. Best in confidence and are not available for release at this time. The present inventories of insulin in this country are at an all-time high level, which would be sufficient to meet anticipated needs for at least two years. The industry has long been cognizant of the problem and has independently taken steps to protect bulk stores of insulin and to activate emergency manufacturing lines if present facilities are destroyed.

Methods of distribution in the pharmaceutical industry are well adapted to meeting the needs of a temporarily isolated segment of population, since hundreds of well-stocked wholesale and branch distributing outlets are maintained throughout the United States. Each of these normally serves as a nearby storage point for emergency needs and is so organized that its individual stockpile of insulin preparations is properly stored and does not become outdated. A conservative estimate is that these outlets maintain a 30 to 60-day supply for each area. Furthermore, the retail pharmacies of the country provide additional storage for another 15 to 30 days in advance of current needs. To this backlog must be added another 30-day supply actually in the hands of the diabetic population. Thus normally enough insulin appears to be widely disseminated at local levels to provide for 60 to 90 days at current rates of usage. The logistics of moving these supplies into disaster areas and augmenting the supplies from larger storage points obviously becomes the responsibility of the over-all civilian defense program.

Owing to the nature of insulin preparations and the legal standards which have been set up for their storage, stockpiling of insulin in the usual sense does not appear practical at the present time. Stocks of insulin must be kept constantly refrigerated, above freezing and below 59 F. They must be moved at sufficiently close intervals into the market to prevent loss on account of expiration of legal storage periods or deterioration. The industry itself is thus in the best position to meet the responsibility of providing adequate supplies and has given every assurance of complete cooperation in this respect. Means for transferring supplies from area to area should therefore be immediately incorporated into the over-all civil defense program.

*Example of a Possible Casualty Picture in Event of Atomic Bombing**

	General Population	Diabetics †
Killed	40,000	.....
Injured, needing hospitalization	80,000	1,600
Minor injuries, needing outpatient care	30,000	.....
Evacuees, uninjured	50,000 ‡	1,600
Total diabetics		3,200 *

---

* These figures are based on estim[illegible] involving an area of 12 to 20 square miles [illegible] 150,000 to 200,000 people (population density [illegible] are mile). The central area in a radius 2 to 2 [illegible] complete destruction.

† Such factors as distribution of the diabetic population and degree of diabetic impairment raise a question as to the value of these estimates.

‡ One-half might find food and shelter among relatives and friends and many would be rapidly evacuated to other parts of the state.

TREATMENT OF DIABETICS IN DISASTER AREA

It is believed that 1% of the population are diabetics and that another 1% are undiagnosed diabetics not heretofore under medical care. Diabetes becomes more severe in the presence of an injury, shock, burn or infection. It is assumed, therefore, that roughly 2% of the casualties would be diabetics, 1% known and 1% unknown. The totals are shown in the accompanying table and represent the maximum number. It is also apparent that many of the diabetic casualties who did not require insulin previously would need it then, as a result of their injuries or of shock. Identification of these cases would be difficult, and on this account the recommendation has been made to government authorities that any program of "tagging" the population with blood groupings and other information for medical treatment include a designation for the known cases of diabetes. Experience during World War II indicated that attempts to tag diabetics as such are not widely acceptable and are doomed to failure.

In addition to the dead and the living casualties, there would be displaced persons who, although uninjured, would be homeless, their dwellings being uninhabitable. An estimation of the numbers of these people who would need the care of local authorities is difficult. A residue of perhaps one-half or one-third of the total displaced persons would need housing and feeding—approximately 20,000 to 30,000 persons.

PREDISASTER TRAINING OF DIABETICS

The urgency for the immediate education and training of civilians in preparation for a possible attack is admitted by all familiar with the problem. The American Diabetes Association, its affiliate associations, and state and county medical societies all should be deeply concerned with an educational program for diabetics. The information should be in simple form which could be printed as a handbill. The following example is suggested.

THE DIABETIC AND THE ATOMIC BOMB

Read the government's small pamphlet called *"Survival Under Atomic Attack."* Get it from your civil defense organization. *Read it!*

Carry your identification (diabetic) card with you at all times, if you have one. If not, civil defense authorities may supply one.

WHERE TO GO

In the event of an atomic bomb attack on your city, the chance of you and your home escaping injury is very good. If, however, you are within the destructive range of the bomb, you could either be injured or uninjured, but your home would probably be partially or entirely destroyed. If you are injured, you will be cared for, *and your diabetic condition will have attention*—rest assured of that. If you are homeless and you have friends who will care for you, you need not worry.

PREPARE TO TAKE CARE OF YOURSELF completely if you are uninjured. Your family and friends should be taught enough about diabetes to take care of you in an emergency.

INSULIN

EVERY DIABETIC should know how to take insulin. There is plenty of insulin. *EVERY DIABETIC TAKING INSULIN* should have his usual *ONE* extra bottle in addition to current needs, and one *EXTRA* insulin syringe with two needles. This is because insulin is your best friend and with it you have the best insurance there is. *Always use your oldest bottle first.* Regular insulin is superior to the other forms for emergency purposes. Carry a little case with your insulin syringe if you have one. If an emergency arises and you must change from long-acting insulin (protamine zinc insulin, globin insulin, or NPH insulin) to regular insulin, take 2 doses of the regular, the morning dose equalling ⅗ of the number of units of your usual dose of the long-acting insulin, and the evening dose, ⅖ of the units. If you have no food, reduce your dose to ½ or ⅓ those amounts to avoid reactions. *Test your urine. Keep to your diet as nearly as possible in all circumstances.* It is better to eat too little than too much. Here is a simple emergency diet one can get under most any circumstances:—

EMERGENCY DIET

Breakfast	*Noon & Night*
Bread, 2 or 3 slices	Meat or cheese sandwich
Butter or margarine	or
Coffee and canned milk	Bread and butter alone, 3 slices,
or	or
In place of bread, a cereal and a can of milk	Meat and potatoes with such vegetables as are available (stew)

You can get along on this simple fare for several days if necessary.

In addition to the known cases of diabetes, potential diabetics may become frank clinical cases, and formerly mild cases controlled with diet alone may, on acco
injury, burns, or shock, require insulin for manage
and prevention of coma. About two-thirds of the dia
population requiring insulin use protamine zinc insu
some other long-acting preparation, and one-third
regular or crystalline insulin. Both types will be avail
so the usual regimen can be continued without reed
tion.

CASUALTIES

Probably one-half to two-thirds of the casualties wo
go to temporary or emergency hospitals, located in
available building, for later evacuation. Most inju
would result from mechanical causes, fire, or radic
tivity. Regular insulin should be used in most instan
either alone or supplementary to protamine zinc ins
or other available long-acting insulin. For routine g
ance, the urine test would have to suffice. Bened
solution is stable enough to permit stockpiling, an
addition supplies of syringes and needles should
stockpiled. For a readily available source of heat, ca
heat or hexamine tablets should be available. The sh
age of blood and plasma would probably be acute;
out blood and plasma and facilities, supplies, and
for intravenous therapy, recourse could be had to
administration of tolerated quantities of salt (1 level
spoonful), soda (½ teaspoonful), and water (1 qt.
first-aid treatment of burns.

Under these circumstances the time-honored ru
thumb for emergency insulin dosage should be h
if carried out every 4 hours in conjunction with the B
dict test. The doses indicated by results of the Be
test are as follows: negative (blue), no insulin
(green), 5 units insulin; 2+ (yellow), 10 units
3+ (brown or orange), *15* units insulin; and 4+ (
20 units insulin. These amounts indicate the app
dosage of insulin necessary to control glycosuria. As
as possible this dosage should be administered p
each meal and thereafter be suitably adjusted so
result in sugar-free urine specimens approximately
hours after each meal. The likelihood of improvem
carbohydrate tolerance after control of glycosuria an
covery from injury should be kept in mind. Insuli
actions should be carefully looked for, and when
occur, an appropriate readjustment of the dose shou
made. It is assumed by the committee that provisio
the treatment of the injured would be made by civ
fense organizations and that intravenous fluids, b
and surgical supplies would be provided.

EVACUEES

All doctors would be busy with the seriously w
and obviously there will be no opportunity for me
supervision of dietary problems. Dietitians and thei
must be trained to be familiar with these problems
how to deal with them. The diabetic should have
idea as to where to go and should try to exert some c
in the food he eats. After deducting those who wo
homes or be evacuated by civil defense authoriti
other cities, a residue would remain who would have
housed and fed. In emergency shelters, dietitian

uld assist the diabetics in their choice of food and in the sting of their urine. Furthermore, those who have no ringes should report to civil defense health services for sistance. If dietitian aids are available, the plan for ring for diabetics and other evacuees needing dietetic lp could be made very flexible.

DIABETIC DIETS IN WARTIME

Administrative Problems.—Thousands of injured peo- e would be too sick to feed themselves. In fact, it has en demonstrated many times that to maintain the pa- ent, the most important factor is to have someone to e to it that he eats what is presented to him. In the case a diabetic this is doubly important. We propose, there- re, that civilian dietitian aids be trained (1) to serve od, and to feed the patient when necessary, and (2) to st the urine and under supervision to give insulin.

Civilian defense training programs should take ad- intage of the skills of graduate dietitians, an intelligent oup which has had a great deal of training in admini- ration of diets. Furthermore, many of them have had ities requiring teaching experience. Graduate dietitians ould then be given a short course prepared by the direc- r of nutrition and his aids, the latter to be physicians ith practical experience in the administration of diets. he dietitians should be trained particularly in handling e problems of the hospital patient.

Civil defense organizations should also recruit young omen of at least high school education who are inter- sted in dietetics. Dietitian instructors from the local ssociation of dietitians, selected by the director of nu- ition, should conduct classes for dietitian aids. They ould be taught (1) how to serve sick people and per- iade them to eat; (2) the principles underlying the diets hich have been planned; and (3) how to examine urine nd how to administer insulin to diabetics.

The Nutritional Value of Diabetic Diets.—The dia- tic diets used in this country can be classified into three pes. The first type is used by the great majority of phy- cians. It may be called the "moderate" diabetic diet be- use in the use of both fat and carbohydrate, the term moderate" is applicable. Protein, 1 gm. per kilogram, nd carbohydrate, 120 to 250 gm., are used. Fat makes p 40% to 55% of the calories. The only change in is diet from the normal is that fat in the normal diet sually amounts to 35% of the calories, and carbohy- rate 50%. These figures are reversed in the diabetic diet. he quantity of protein in such diets meets all require- ents. Calcium is largely supplied by a pint of milk; the itamins should be supplied in more than sufficient uantities. Actually, the shift from carbohydrate to fat alories in the amounts represented by these diets does ot raise any nutritional problems.

The second type of diet most commonly used is the igh carbohydrate—low fat type. In this diet fats make p 20 to 25% of the calories and carbohydrate 60%. hus in diets containing between 1,600 and 2,400 cal- ries, the carbohydrate intake amounts to 240 to 380 gm. er day. It is important to use the limited amount of fat the greatest advantage nutritionally. Probably it is best supply the fat in the form of eggs and whole milk. Then fat meats, cheese (except cottage cheese), and butter can be used only in very small amounts. Vitamin A will be largely in the form of carotene.

The third type is indistinguishable from the normal diet and is called the unrestricted type of diabetic diet.

Nutritionally, diabetic diets should be adequate. Whether they are or not depends on whether the rules for good nutrition are followed. These rules are really no more and no less important to the diabetic than they are to the nondiabetic.

WARTIME FOOD RESTRICTIONS AND THE DIABETIC DIET

At this time, one can do little more than anticipate the restrictions that may occur. The experiences of the last war provide the basis for this short discussion. Three subjects are pertinent. 1. The added stimulus that wartime diets exert on the overweight patient to undertake reduction. 2. Important modifications of the diabetic diet that might be necessary in the event of food shortages and food rationing. 3. Special food allowances, if any, for the diabetic in the event of rationing.

Obesity.—Since so many diabetics, particularly those past 50, are overweight, the question arises as to whether the dietary restrictions caused by war do not make it important for the physician to urge more strenuously than ever that the overweight diabetic reduce. This is particularly important inasmuch as many of the restrictions to be expected tend to reduce the amount of available noncarbohydrate foods and increase the proportion of carbohydrate foods. The best solution here would seem to be a reduction in the amount of food eaten. All thoughtful physicians agree that a slow reduction of weight to a level corresponding to the Metropolitan Life Insurance Company's table is a great aid to the health of the diabetic. However, one must keep in mind that the diabetic is a working member of society and that his ability to work should have first consideration. Therefore, the physician must bear the responsibility of dealing with the question of reducing in the individual case. Even if this is true, the general statement that reduction of weight improves the health of the diabetic and increases his productivity seems justified.

Fat Shortages.—The majority of physicians in this country use the moderate type of diet outlined above, with 40 to 55% of the calories derived from fat. It is important to decide whether this amount can and should be reduced. The diets during wartime include a larger number of calories from carbohydrate. In other words, it must be decided whether it is wise to change the diets used by the majority of physicians and urge them to adopt the lower fat and higher carbohydrate type. This policy seems unwise even if there should be considerable fat shortage, because it would make for confusion on the part of both doctor and patient. The diets which have the approval of the majority of physicians should be maintained. In the event of rationing and scarcity of fat, the physicians should nevertheless have the privilege of prescribing it in diabetic diets to the extent of 35% of the calories.

Rationing and Diabetic Diets.—During World War II fats, meats, sugar and canned goods were rationed. Should the diabetic be allowed extra ration points in these categories?

Meats: Because the usual diabetic diet does not contain as much cereal, breadstuffs, beans, and potato as the nondiabetic diet, the patient obtains more protein from meats. The sources of protein in the diabetic diets are meats, milk products, and breadstuffs in that order. But since we classify fish as meat and since it is not usually rationed, the diabetic often can get his protein from fish. Cheese, eggs and milk, if they are available and unrationed, are also excellent meat substitutes. Under normal conditions, it is true, the diabetic does eat more protein in the form of beef and pork than the nondiabetic; the result is that meat rationing is somewhat harder on the diabetic than on the nondiabetic.

Fats: Extra fat points are justifiable if the diabetic is not obese, or the total of basal and work calories is above 2,000. More specific statements can be made only if rationing is instituted.

Canned Goods: Water-packed fruits probably would not be available in wartime. Diabetics should be made aware of the desirability of home canning of both fruits and vegetables. In the light of probable wartime restrictions of enriched cereals, diabetics should be allowed more canned vegetables than nondiabetics.

DISSEMINATION OF INFORMATION

It is evident that the special requirements of our diabetic population of one million persons must be integrated into the civil defense program as a whole if this large segment is to be protected and maintained in its normal state of productivity in the national effort. The government services have already demonstrated their awareness of the problem, as have the National Health Council and the Council on National Emergency Medical Service of the American Medical Association. Our purpose here is not to discuss the logistics of procuring and distributing food and insulin to the thousands of potential diabetic casualties, but to point out their special needs so that measures for their care can be formulated and incorporated into the civil defense plans—federal, state, and local.

11 W. 42d St., New York City.

The Patient's Response.—In the words of Hippocrates, "the patient must cooperate with the physician in combating the disease." With advances in medicine are we passing away from this simple truth? Are we becoming more and more imbued with those specific cures and treatments which we shoot at disease like so many magic bullets? Do we not sometimes forget that these cures still demand a response from the patient which it is our duty to explain to him and to demand? Disease can never be dissociated from the individual. In much of medicine there is no specific cure, but there are ways and conditions of life which affect the basic issues of health and immunity. Their ordering is a prescription just as truly as anything written on a form, and it is a prescription to which you as wise doctors will often resort.—Charles Cameron, M.D., The Physician and His Art, *Lancet*, Aug. 25, 1951.

BUREAU OF MEDICAL ECONOMIC RESEARCH

MEDICAL CARE EXPENDITURES, PRICES AND QUANTITY, 1930-1950

Frank G. Dickinson, Ph.D.
Director, Bureau of Medical Economic Research

*This is the fifth in a series of publications of the Bureau
Medical Economic Research on personal consumer expendit
for medical care in relation to expenditures for other items in t
consumer's budget.*[1] *These publications are based on the d
published yearly by the National Income Division of the Of
of Business Economics, United States Department of Commen
in the Survey of Current Business. They contain data for
years 1929-1949. The most recent data compiled by the Dep
ment of Commerce is presented in National Income and Prod
of the United States, 1929-1950: 1951 Supplement to the Surv
of Current Business. This edition contains, in addition to
previously published material, data for the year 1950 and revi
data for 1948 and 1949. Since the Bureau of Medical Econon
Research has already presented yearly data for the period 19
through 1949, the present bulletin will contain data for 19
1935-1939, 1940, 1945, and 1950, and the revised data for 1
and 1949.*

PERSONAL CONSUMER EXPENDITURES

How great is the demand for medical care in the United Stat
Medical care is such a vital service that one is tempted to
"There is no measure of the demand for medical care." W
the *need* for medical service may be incalculable—as indee
the need for most goods and services—medical service is
economic good and as such has a *demand* which can be m
ured. If medical care were available in unlimited quantities
for example, air is, it would be a free and not an economic g
It would have no price, just as air has no price. The suppl
medical care, however, is not unlimited. It requires the serv
of people who have livings to earn and requires facilities w
must be purchased and maintained; and the amount and qu
of these personnel and facilities depend to a large degree on
amount of money people are willing to spend for them. Whe
the bill is paid by individual consumers, by insurance compa
by government agencies, or by physicians giving "free" serv
it must be paid. A complete measure of the demand for mec
care would require a vast amount of information on what wo
be spent if medical care prices were different in addition to
showing the amounts that are being currently spent for med
care at current prices. In this limited sense, the amount spen
consumers for medical care is the measure of their demand
medical care—the "market" demand. Since consumer dem
represents the greatest portion of the total demand for med
services, the market demand for medical care is largely refle
in the amounts of personal consumer expenditures for med
care; these exclude expenditures by agencies of local, state,
federal government.[2] According to Department of Comm
estimates, Americans spent \$8.5 billion on medical care in 1
(Table 1 and Chart 1). At the same time the expenditures for
goods and services were \$193.6 billion. Thus expenditures
medical care in 1950 constituted 4.4% of the total amount s

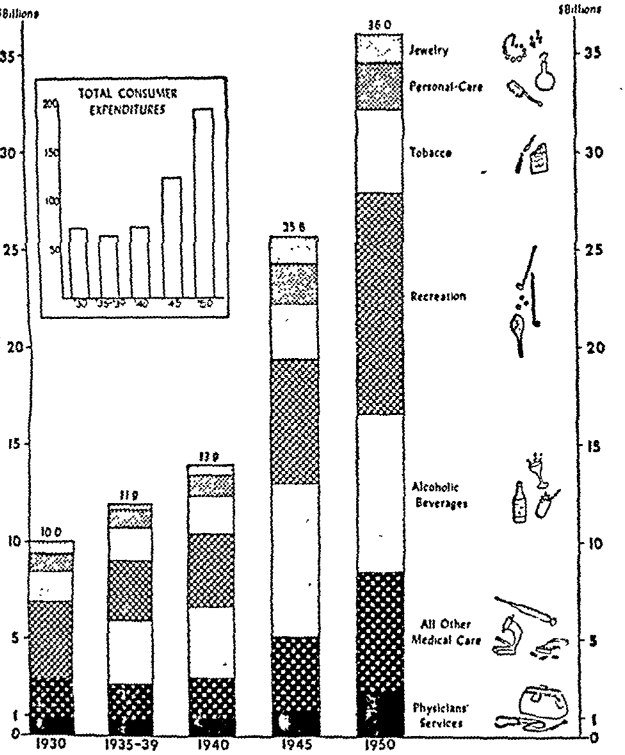
Medical Economic Research, assisted in the preparation of this study

This article with two additional charts and six additional tables
been preprinted as Bulletin 87 of the Bureau of Medical Economic
search. A copy will be sent on request to the Bureau, 535 N. Dearb
St., Chicago 10.

[1] The four previous publications are Bulletin 60, Is Medical Care
pensive? (Sept.) 1947; Bulletin 66, The Cost and Quantity of Medical C
in the United States (Sept.) 1948; Bulletin 72, 1949 Supplement to Bull
66: The Cost and Quantity of Medical Care in the United States (D
1949; and *Miscellaneous Publication* M-37, Latest Data on Personal C
sumer Expenditures in the United States (Aug.) 1950.

on all goods and services in the consumer's budget; that is, the American people spent roughly 96% of their budgets for items other than medical care (Table 2). In 1930, expenditures for medical care were $2.9 billion while total consumer expenditures were $70.8 billion; medical care expenditures equaled 4.1% of total consumer expenditures. In 1935-1939, the period commonly used as a base for the purpose of statistical comparisons, average annual expenditures for medical care were $2.6 billion and total consumer expenditures, $63.6 billion; medical expenditures were 4.2% of total consumer expenditures. As a matter of fact, for every year since consumer expenditure data were first compiled, the proportion of the consumer's budget spent for medical care has fluctuated narrowly around 4%. The rise from 4.2% to 4.4% between 1945 and 1950 largely reflects wartime conditions in 1945, the tremendous increase in the number of births in the postwar years, the rapid rise in hospital room rates, and the increased use of hospitals.

Of the $8.5 billion spent by consumers on medical care in 1950, $2.4 billion was spent for physicians' services, $2.0 billion for hospitals, $1.4 billion for drugs and sundries, $1.0 billion for dentists' services, and $1.7 billion for "all other medical care."



Source: Survey of Current Business, 1951 National Income Supplement.

Chart 1.—Selected consumer expenditures in the United States, 1930-1950 (Table 1).

If the total amount of the expenditures for medical care in 1950 is set equal to one dollar, "the medical care dollar," 28.1 cents was spent for physicians' services, 23.1 cents for hospitals, 17.2 cents for drugs and sundries, 11.7 cents for dentists' services, and 19.9 cents for "all other medical care" (Table 3 and Chart 2). This compares with 31.8 cents spent for physicians' services in 1930, 13.9 cents for hospitals, 19.5 cents for drugs and sundries, 15.9 cents for dentists' services, and 18.9 cents for "all other medical care." Thus, over the 20-year-period, the physicians' average share of the medical care dollar fell 12%, the hospitals' share rose 66%, and the dentists' share fell 26%; the portion spent on drugs and sundries dropped 12% and the portion on "all other medical care" rose 5%. If the base period 1935-1939 is taken as a point of reference, the trend is found to be generally the same. The physicians' share of the medical care dollar fell 10%, the hospitals' share rose 37%, the dentists' share fell 10%, the portion for drugs and sundries fell 17%, and the portion for "all other medical care" rose 9%.[3] Thus, within the medical care group, the portions spent on physicians, dentists, and drugs and sundries have shown a continuous decline, while the portion spent on hospitals has been increasing.

Another view of the changes in consumer expenditure patterns is presented in the index numbers (1935-1939=100) in Table 5. The index for total consumer expenditures was 305 in 1950, for medical care 320, for physicians' services 289, for hospitals 436, for drugs and sundries 266, for dentists' services 287, and for "all other medical care" 348. While the amounts in billions of dollars spent for each of these medical care items have increased, total consumer expenditures have increased so rapidly that the percentage of total consumer expenditures spent for these medical care items has actually decreased except for hospitals and some of the minor items included in "all other medical care." The fact that the amount spent for medical care (320) has risen more rapidly than the amount spent for total consumer expenditures (305) is, therefore, due to the extremely sharp rise in the amount spent on hospitals and, to a much smaller extent, on the considerable increase in the amount spent on "all other medical care."

How does the demand for medical care compare with the demand for other items in the consumer's budget? The Department of Commerce divides its estimates of personal consumer expenditures into 12 broad groups. Among these, the largest expenditures were for food and tobacco, equaling 33.8% of total consumer expenditures in 1950. The other groups for which expenditures were large were clothing, accessories, and jewelry, constituting 11.8% of the consumer's budget, housing 10.3%, household operation 13.7%, and transportation 11.7%. The lowest expenditures were for private education and research, or 0.9% of total consumer expenditures. Medical care and death expenses constituted 4.9% of the consumer's budget.[4]

---

[2] Personal consumer expenditures as defined in the Department of Commerce estimates include expenditures made by the American people as individuals, but not as taxpayers; that is, these estimates do not cover expenditures made by government. The Department of Commerce personal consumer expenditure series covers 206 items (counting subgroups) which are classified into 12 main groups. The sixth of these groups, "medical care and death expenses," includes physicians' services, hospitals, drugs and sundries, dentists' services, 11 relatively minor medical care items referred to herein as "all other medical care," and three death expense items which will be largely eliminated from this analysis.

The Department of Commerce's estimates for hospitals are based on the operating expenses of nonprofit hospitals and include payments by patients (or insurers) only in the case of proprietary hospitals. Expenditures for physicians' and dentists' services are estimated from the gross receipts which practitioners in independent private practice derive from individuals; the totals for these items do not include such items as payments to practitioners in government hospitals or payments by insurance companies and by businesses paying on a fee basis. Consumer expenditures for x-ray and general laboratory services are included in the amounts for hospitals when rendered by hospital laboratories and in the amounts for physicians' services when rendered by private laboratories.

The computation of the amounts for services of physicians and dentists involves three factors: the number of physicians and dentists in independent professional practice, the average gross income from professional practice and the percentage of gross income derived from personal consumer expenditures as distinguished from receipts such as those for services rendered to agencies of government. The Bureau of the Census has not yet made available the results of its 1950 count of physicians and dentists in independent practice; nor has the analysis of the returns from the physicians' income survey developed this percentage for 1949. The estimates of personal consumer expenditures for the services of physicians and dentists in recent years will, therefore, be revised by the Department of Commerce when these enumerations are made available and when the analysis of the returns in the physicians' incomes survey has been completed. The recent surveys of the incomes of the members of these two professions conducted by the Department of Commerce with the cooperation of the American Medical Association and of the American Dental Association have established excellent statistical information on average gross (and net) incomes. (See: Dickinson, F. G., and Bradley, C. E.: Survey of Physicians' Incomes, J. A. M. A. **146:** 1249 [July 28] 1951, reprinted as Bulletin 84, Bureau of Medical Economic Research, American Medical Association, 1951. This bulletin summarizes and interprets data presented in: Weinfeld, W., Income of Physicians, Survey of Current Business, Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce **31:** 9 [July] 1951).

[3] This broad category includes 11 items for which expenditures are relatively small. As Table 4 shows, the proportions of the medical care dollar allocated to most of these items have remained relatively constant since 1935-1939. The principal changes have occurred in the expenditures for the three items shown in rows 8, 12, and 14. Personal consumer expenditures for "private duty trained nurses" declined from 2.4% of total expenditures for medical care in the base period to 1.3% in 1950. The percentage for "net payments to group hospitalization and health associations" increased from 0.2 to 1.7 and the percentage for "accident and health insurance—net payments" increased from 3.7 to 5.6. The sharp increase in these latter two items reflects the tremendous growth of voluntary health insurance. The expenditures described in these two rows refer to the overhead cost of operating these insurance plans; the amounts shown are approximately the excess of the premiums received over the benefits paid.

Much more meaningful, however, are comparisons of medical care with certain individual items which bear some general resemblance to the medical care items in magnitude of expenditure and frequency of purchase. Of the $193.6 billion spent on all items in 1950, $8.1 billion, or 4.2% of the total, was spent for alcoholic beverages; $11.3 billion, or 5.8%, for recreation; $4.4 billion, or 2.3%, for tobacco; $2.3 billion, or 1.2%, for personal care; and $1.5 billion, or 0.8%, for jewelry. Thus, in 1950 Americans spent about as much for alcohol as for all types and kinds of medical care. They spent over a third more for recreation. They spent as much for personal care and almost twice as much for tobacco as they did for physicians' services, and they spent slightly more for jewelry than for drugs and sundries. The American people have chosen to spend their budgets in this manner. Each person deciding in his own way how he should spend his income has determined the market demand for every item. Americans spent only 4% of their money for medical care not because they did not have more to spend, but because they thought they could get what they wanted most by spending 96% of their money on items other than medical care—items including jewelry, alcoholic beverages, and tobacco. The consumer—the dictator in a free economy—has made his choice. In fact, "personal savings" in 1950, the amount consumers had left over after spending $193.6 billion, was $10.7 billion! The personal savings of 1950 and those accumulated over the years constitute spending ability which consumers can draw upon as they wish. T accumulated savings in 1950 were very large even after allo for inflated values and the universal failure to consider go ment bonds as a liability as well as an asset.[5] It is most u tunate that so many discussions of ability to purchase me care or other goods and services assume that current inco the sole measure of purchasing power. An expensive illne among the rainy days for which people seek to make provisio saving. As a direct result of ignoring the existence of t accumulated savings—savings which some political leaders p to with great pride—some persons have concluded that the m cal and hospital bills not covered by prepayment insurance be postpaid out of current income. This unrealistic approa the question of ability to pay the costs of modern medical deserves more attention than can be given in this article.

The source of the expenditure data in dollar amounts in this table and those which follow is National Income and Product of the United States, 1929-1950: 1951 Supplement to the Survey of Current Business, United States Department of Commerce, Bureau of Foreign and Domestic Commerce, 1951, Table 30, pp. 192-198. The data, which are given in *millions of dollars in the source, have been rounded to tenths of billions* of dollars in the tables. The percentage data were computed from the dollar amounts in millions.

Brief descriptions of most of the items, arranged by column numbers, are presented below:

(2) Total Medical Care: Includes physicians' services, hospitals, drug preparations and sundries, dentists' services, and all other medical care items; rows 1-15 of Group VI (p. 194) in source.

(4) Hospitals: Includes payments by patients to proprietary hospitals and sanitariums and operating expenses of nonprofit hospitals and sanitariums; row 11 of Group VI in source.

(7) All Other Medical Care: Includes ophthalmic products and orthopedic appliances, osteopathic physicians, chiropractors, chiropodists and podiatrists, private duty trained nurses, practical nurses and midwives, miscellaneous curative and healing professi payments to group hospitalization and health asso student fees for medical care, accident and health insura payments, mutual accident and sick benefit associations— ments; rows 2, 5-10, 12-15 of Group VI in source.

(8) Alcoholic Beverages: *Includes distilled spirits, wine, a* packaged form and by the drink; footnote 1 in source.

(9) Recreation: Includes admissions to specified spectator ments, pari-mutuel net receipts, nonvending coin m receipts minus payoff, specified commercial participant ments, informal recreation, flowers, seeds and potted plan fees, clubs, commercial amusements; Group IX in source

(10) Tobacco: Includes tobacco products and smoking supplie of Group I in source.

(11) Personal Care: Includes toilet articles and preparations shop services, beauty parlors, baths and masseurs; G in source.

(12) Jewelry: Includes purchases of jewelry and watches, wat and jewelry repairs; rows 12-13 of Group II in source.

TABLE 2.—*Selected Consumer Expenditures as a Percentage of Total Consumer Expenditures, 1930-1950*

PRICES AND WAGES COMPARED

While expenditures for medical care and expenditures goods and services in the consumer's budget increased at a mately the same rate, medical prices lagged considerably prices in general. By 1950, the price of all goods and s as measured by the U. S. Bureau of Labor Statistic's Con Price Index[6] was up 72% since 1935-1939; the price of care and drugs had risen only 48% (Chart 3). Physicia were up 40%, general practitioners' fees 40%, and s and specialists' fees 41%. Of all the medical care items, rates alone rose more rapidly than the price of all go services—up 135% in 1950. At the same time, howev these medical care items underwent a relatively small i in price, average weekly earnings mounted rapidly. Acco the U. S. Bureau of Labor Statistics[7] average weekly ear

---

4. Death expenses (funeral and burial expenses, cemeteries and crematories, monuments and tombstones) accounted for $1.1 billion of consumer expenditures in 1950, or 0.6% of total consumers expenditures. In the base period they accounted for 0.8% of total consumer expenditures.

5. See the discussion of this obscure point in Dickinson, F. G.: How Rich Are You? Bureau Bulletin 65 (Sept.) 1948.

oduction workers in manufacturing industries increased 165% tween 1935-1939 and 1950. With medical care and drug prices ing only 48%, just 56% of a week's wages in 1950 was necesry to purchase the same amount of medical care as a whole ek's wages in 1935-1939 (Chart 4). Only 53% of a week's ges in 1950 was necessary to purchase the same amount of ysicians' services as a whole week's wages in the base period. r the same amount of general practitioners' services or for the same amount of surgeons' and specialists' services a person would have to work only 53% as long in 1950 as in 1935-1939. The hospital services purchased with a week's wages in 1935-1939 would require 89% of a week's wages in 1950. These percentages do not, of course, reflect any changes in the average amount of services or drugs or in the average length of hospital stay required for a given illness.

How do these percentages compare with the percentages of a week's wages necessary to purchase other items in the consumer's budget? For the same amount of food as could be purchased with a week's wages in 1935-1939, 77% of a week's wages would be necessary in 1950; for the same amount of recreation, 62%; personal care, 67%; transportation, 61%; women's housedresses, cotton, 103%; rent, 50%; and for the same amounts of all goods and services, 65%. Since average weekly earnings rose so high in comparison to the Consumers' Price Index, less than a week's wages would be required to purchase most of these other items in the consumer's budget. Except for rent, however, the percentages are greater than those for medical care. This is to be expected, since medical prices rose less rapidly than the prices of most items in the consumer's budget.

6. The Consumers' Price Index measures monthly the changes since 1935-1939 in the prices of fixed quantities of goods and services normally purchased by moderate-income families in large cities. A more complete analysis of this Index and the indexes of medical care items is presented in Medical Care Prices and the Cost of Living, J. A. M. A. **147**: 258 (Sept. 15) 1951, reprinted as Bulletin 86, Bureau of Medical Economic Research, American Medical Association, 1951.

7. Handbook of Labor Statistics, 1947 Edition, Bureau of Labor Statistics, U. S. Department of Labor, Buletin No. 916, Table C-1, p. 54; data for 1950 from Monthly Labor Review, Bureau of Labor Statistics, U. S. Department of Labor **73**: 235 (Aug.) 1951.

QUANTITY

The quantity of a given item purchased during a particular year can be obtained by dividing the year's expenditures for that item by its average price. For example, $\frac{\text{expenditures for bread}}{\text{average price per loaf}}$ = the number of loaves purchased during the year. Similarly, a rough index of quantity for an item can be obtained by dividing the index of the expenditures for that item by the corresponding index of the price of that item. When this procedure is followed, it is found that the index of the quantity of medical care rose from 1.0 in 1935-1939 to 2.2 in 1950. This crude ratio or index indicates that the total amount of medical care delivered to the American people has more than doubled since the base period. Because of a 17% increase in population during these years, the increase in quantity per person was somewhat less, or 85%.

Such indexes of quantity, however, have certain inherent limitations. Primary among these is the fact that consumer expenditures are estimated for the entire nation while the price indexes cover only moderate-income families in 34 large cities. Thus the purchases of consumers in upper and lower income groups and in less populous areas are included in the expenditure series but are not reflected in the price series. The question, however, is not whether medical care prices are usually higher or lower for these excluded groups and areas but whether the percentage rise was higher or lower since the base period. The entire price series is widely used by statisticians as a deflator of many dollar series in measuring quantity and is generally the basis of wage negotiations between employers and employees regarding the cost of living. But because of the chance of error resulting from such limitations, it would perhaps be more realistic to estimate that the per capita quantity of medical care received in 1950 was somewhat less than 85% greater than the quantity received a dozen years earlier.

TABLE 4.—*Eleven Items Composing "All Other Medical Care" Expenditures, 1935-1939, 1948, 1949, and 1950 In Billions of Dollars and as a Percentage of Total Medical Care Expenditures*

Expenditure Item (By row number in source)	1935-1939		1948		1949		1950	
	Billions of Dollars	Percentage of Total Medical Care	Billions of Dollars	Percentage of Total Medical Care	Billions of Dollars	Percentage of Total Medical Care	Billions of Dollars	Percentage of Total Medical Care
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
ALL OTHER MEDICAL CARE	$0.483	18.3%	$1.455	19.4%	$1.554	19.7%	$1.682	19.9%

15. Mutual accident and sick benefit associations—net payments	0.019	0.7	0.055	0.7	0.057	0.7	0.057	0.7

TABLE 5.—*Selected Consumer Expenditures, 1930-1950, as a Percentage of the 1935-1939 Average*

Year	Medical Care						Alcoholic Beverages	Recreation	Tobacco	Personal Care	Jewelry	Total Columns (3) through (12)	Tota Consu Expe ture
	Total Medical Care	Physicians' Services	Hospitals	Drugs and Sundries	Dentists' Services	All Other Medical Care							
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)	(14)
1930	110%	113%	90%	104%	134%	114%	.....	127%	89%	113%	170%	84%	111%
1935-1939 (average)	100	100	100	100	100	100	100%	100	100	100	100	100	100
1940	116	111	118	117	121	119	114	119	109	121	134	117	113
1945	195	163	206	214	188	220	243	201	180	227	383	215	191
1948	283	261	354	258	259	301	255	320	255	245	421	282	280
1919	298	276	385	256	270	322	248	327	262	242	407	286	283
1950	320	289	436	266	287	348	253	360	271	250	422	303	305

How have the quantity indexes for the individual medical care items behaved? If the same procedure is used, the resulting index of quantity for physicians' services is 2.1 for 1950, or twice as great as the quantity in 1935-1939. Again a more conservative estimate of the increase in quantity since the base period is warranted. After allowing for the gain in population and the shortcomings of the data for these computations, the increase in the per capita quantity in physicians' services received was at le
⅓ to ½.

These indexes can also be used to give a rough indication of the increase in the amount of services delivered per physician. According to the latest available data, the increase in the number of physicians between 1935-1939 and 1950 was 22%. If the index of the quantity of physicians' services is adjusted for this increase, it is found that the amount of services delivered per physician during these years increased about 7/10. A more conservative estimate would be an increase of 5/10. This undoubtedly demonstrates the increased capacity of the physician to care for patients made possible through the greatly expanded use of nurses and technical assistants, the introduction of wonder drugs, improved transportation, the increasing proportion of patients seen in the hospital and office, and other increases in technological efficiency.

The quantity index for hospital services in 1950 was 1.9, for dentists' services 1.9, and for drugs 2.1. Once again, the limitations of the data for this purpose should be considered.

There are many references in current economic and enginee ing literature to the increased output per manhour or per machi which has resulted from rapid technological changes in rece years. Our analysis of the quantity of medical services sugges but does not prove, that the rate of increase in output per pers working in the medical care field may exceed the comparat rate in the manufacture of automobiles, the production of coal, the transportation of commodities. It should be extremely cle to all students of medical economics that the supply of medic services can no longer be measured by counting the number active physicians, dentists, and nurses. The American people a enjoying the fruits of technological improvements in the field medicine just as in industry, agriculture, and transportation.

On the whole, these indexes indicate that the American peop in 1950 were receiving relatively more medical care for the money than they were in 1935-1939. But the great improvemen in the quality of medical care, which have made a given amou of services so much more effective today, can never be measure by quantity indexes. Such tremendous strides in our healt ogress as the sharp reduction in the number of maternal deaths 1,000 live births from about 5.0 in 1935-1939 to less than 1.0 1950 and the jump in life expectancy at birth from 59.5 years 1930 to more than 68 years in 1950 are not measured by exes of the quantity of medical care.

* * * *

Over the last 20 years, the American people have spent a con-nt proportion of their consumer budget, roughly 4%, for dical care. The demand for medical care has been small in nparison to the demand for other consumer items. It has been all, not because people could not afford more, but because y preferred to spend their budgets in this manner. In the past e could say that the irregularity and unpredictability of medical penses were greater deterrents to the purchase of medical re than the actual amount of the expenses. Today, however, widespread availability of hospital and medical insurance akes medical care a readily marketable item. A family can rchase a typical Blue Cross-Blue Shield membership, which ll pay the bulk of hospital and in-hospital medical bills for ughly 25 cents a day—the price of a package of cigarettes. surance helps a particular family to approach the 4% level, average for all families. With over half the population carry- some form of medical or hospital insurance, the small de- and for medical care certainly does not mean that people do t have the money for medical care, but that they are purchas- the amount they desire. And with the index of the prices of edical care, including the high hospital rates, lagging behind e Index of all consumer prices, they are receiving much more edical care for their money. In fact, average weekly earnings ve risen so much more rapidly than the cost of medical service at a production worker today can buy almost twice as much edical care with a week's wages as he could in 1935-1939. nd health progress has given him another dividend—more and etter years in which to earn. Today, in a period of general flation, the consumer is getting more and better medical care r the same proportion of his personal consumer expenditures.

COUNCIL ON PHARMACY AND CHEMISTRY

The Council on Pharmacy and Chemistry and the Council on Foods and Nutrition have authorized publication of the follow- ng statement.

R. T. Stormont, M.D., *Secretary*
Council on Pharmacy and Chemistry
James R. Wilson, M.D., *Secretary*
Council on Foods and Nutrition

FLUORIDATION OF WATER SUPPLIES

The Council on Pharmacy and Chemistry and the Council on Foods and Nutrition have been requested to state their opinion regarding the safety of fluoridation of water supplies, a procedure which has now been adopted by more than 140 cities.

The Councils are unaware of any evidence that fluoridation of community water supplies up to a concentration of one part per million would lead to structural changes in the bones or to an increase in the incidence of fractures. The only difficulty so far revealed is a possible increase in mottling of the tooth enamel. The available evidence based on thousands of observations indicates that the incidence of mottling of the enamel in children who drink water containing fluoride up to a concentration of one part in a million is minimal and detectable only by careful dental examination. It occurs only in a small percentage of children and is so slight as not to present a problem from the point of view of appearance or strength of the teeth. Evidence of toxicity other than the effect on enamel has not been reported in communities where the water supply has several times this concentration. After considering the evidence available at this time, the Councils believe that the use of drinking water containing up to one part per million of fluoride is safe. However, the use of products which are naturally high in fluoride content, such as bone meal tablets, or of lozenges, dentifrices, or chewing gum, to which fluoride has been added, should be avoided where the drinking water has been fluoridated. In places where children are subjected to warm temperatures and consequently drink large amounts of water, a lower concentration of fluoride may be necessary to avoid mottling of the teeth.

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

R. T. Stormont, M.D., *Secretary.*

Phenylephrine Hydrochloride-U.S.P. (See New and Nonofficial Remedies 1951, p. 198).

Elixir Neo-Synephrine Hydrochloride: 473 cc. and 3.78 liter bottles. A flavored alcohol solution containing 1 mg. of phenylephrine hydrochloride in each cubic centimeter. U. S. Trademark 406,720. Winthrop-Stearns, Inc., New York.

Capsules Neo-Synephrine Hydrochloride: 10 mg. and 25 mg. U. S. Trademark 406,720. Winthrop-Stearns, Inc., New York.

Streptomycin-U.S.P. (See New and Nonofficial Remedies 1951, p. 132).

Streptomycin Sulfate: 5 cc., 12 cc., and 20 cc. vials. Powdered streptomycin sulfate equivalent in activity to 1 gm., 2 gm., and 5 gm. of streptomycin base, respectively. E. R. Squibb & Sons, New York.

Pertussis Vaccine-U.S.P. (See New and Nonofficial Remedies 1951, p. 389).

Pertussis Vaccine: 1.5 cc. (one immunization) and 7.5 cc. (5 immunizations) vials. 50,000 million *H. pertussis* per cubic centimeter. Preserved with thimerosal 1:10,000. Eli Lilly & Company, Indianapolis, Ind.

Butabarbital Sodium (See New and Nonofficial Remedies 1951, p. 240).

Powder Butabarbital Sodium: Bulk; for manufacturing use. Chemo Puro Manufacturing Corp., Long Island City, N. Y.

Sodium Dehydrocholate (See New and Nonofficial Remedies 1951, p. 316).

Solution Sodium Dehydrocholate 20%: 5 cc. and 10 cc. ampuls. E. S. Miller Laboratories, Inc., Los Angeles, Calif.

Sodium Caprylate (See New and Nonofficial Remedies 1951, p. 48).

Powder Sodium Caprylate: Bulk; for manufacturing use. Chemo Puro Manufacturing Corp., Long Island City, N. Y.

Methylthiouracil (See New and Nonofficial Remedies 1951, p. 404).

Powder Methylthiouracil: Bulk; for manufacturing use. Chemo Puro Mfg. Corporation, Long Island City, N. Y.

Sulfadiazine-U.S.P. (See New and Nonofficial Remedies 1951, p. 96).

Tablets Sulfadiazine: 0.5 gm. Van Pelt & Brown, Inc., Richmond, Va.

LABORATORY CONTROL OF ANTIBIOTIC THERAPY

The problems of antibiotic therapy have been multiplied by the increase in the number of commercially available antibiotics and in the number of bacterial strains resistant to one or more of them. Selection of the most effective antibiotic for treatment of a given infection is frequently difficult. Confronted with an infection of uncertain bacteriologic origin, the clinician has several courses open to him. He may attempt to deduce the causative agent from the clinical symptoms and administer the antibiotic known to be effective against most strains of that organism. In some cases this approach is successful, but often the first drug tried is ineffective because of lack of susceptibility of the infecting agent. Valuable time may thus be lost in blind clinical trial, and avoidable complications may occur. To prevent this, many clinicians routinely determine the infecting organism bacteriologically, so that they can select the appropriate antibiotic with greater assurance. Others believe it impractical to determine the antibiotic of choice from standard tables because of the frequent occurrence of resistant strains within some species. These workers maintain that maximum efficiency in antibiotic therapy can be obtained only by routine determination of the in vitro sensitivity of the causative organism to the available antibiotics.

Theoretically the last approach would appear to be the most desirable, but there are practical objections. Perhaps the most serious is the observation that clinical results do not always parallel laboratory results in antibiotic testing. Another objection is that the various sensitivity tests are not as accurate or as reliable as many clinicians believe. It has been shown, for example, that the results of most of the currently used tests can be varied at will by altering one of the following factors: (1) size of the inoculum, (2) period of incubation, and (3) choice of complete or partial inhibition as the end point of the tests.[1] Variations in media may introduce further discrepancies.[2] Obviously all test conditions must be rigidly controlled if the tests are to have significance or if the results of two laboratories are to be compared. E with such control the serial dilution methods are acc only within the range of a two-fold dilution of the a biotic,[1] and the antibiotic disk technique gives re that vary in triplicate as much as ±25%.[3] Thus no the methods lends itself to accurate quantitation.

Moreover, when several antibiotics are tested ag a single organism by a single technique, compariso results may be misleading. Variations in any of the conditions mentioned may have different effects on ferent antibiotics,[1] so that the relative sensitivity of organism to each antibiotic may be changed under ferent conditions. According to Patrick,[4] even rigidly controlled conditions comparisons of bacte sensitivity to two or more antibiotics cannot be made rectly by the antibiotic disk method as ordinarily formed. The antibiotic that produces the largest zon inhibition of bacterial growth on the culture plate is necessarily the one to which the test organism is sensitive. The size of the inhibition zone may be m fied by other factors, including the diffusibility of the a biotic through the agar and the concentration of antibiotic in the tablet or disk. While the diameter of zone of inhibition increases with the concentratio the antibiotic above the minimal inhibitory tion, it increases more rapidly for some antibiotics for others,[1] so that relative sensitivity values may ch when disks of different concentrations are used.

Attempts to rectify this situation have been made least two groups of workers. Patrick and associates[4] determined simultaneously the inhibition zones obt by the antibiotic disk method and the minimum concentrations obtained by the tube dilution test and expressed the former roughly in terms of the latter. permits direct comparison of sensitivities in tern tube-dilution values. Spaulding and Anderson,[3] o other hand, have preferred to adjust by trial and concentration of each antibiotic disk to the point in their hands, the results of the disk technique an tube-dilution method parallel each other and no co sion factors are needed. If these two modifications disk technique are found to be generally applicable, may increase the clinical usefulness of the method. J son and Finland,[1] however, caution that compa between different methods are unreliable. In an exte study they found variations of 64 to 128-fold in values obtained by different methods for the sensitivi a given organism to aureomycin. Corresponding ations with respect to terramycin were 4 to 32-fold, with respect to streptomycin, 8 to 64-fold.

It is apparent that there are many pitfalls in the a cation of sensitivity tests to the clinical control of biotic therapy. Further refinements of technique and relation of clinical and laboratory results are before the total picture can be clarified. In the a reasonable approach seems to be that of Jackson Finland,[1] who regard sensitivity tests as performed in ordinary clinical laboratory as only general qualit guides which distinguish susceptible from nonsuscep organisms. Even this distinction may not be made by antibiotic disk method unless the proper range of biotic concentrations is employed.[5] Jackson and Fin lieve that it is much more important to determine the iologic agent accurately than to perform routine sensi-vity tests. Since some species, such as pneumococci, nococci, and group A streptococci, are more or less iform in their susceptibility to any given antibiotic,[6] fections caused by these organisms can be treated with-ut resort to sensitivity tests. On the other hand, such sts are indicated when the infection is caused by aphylococci or enterococci, or other species, different rains of which have been shown to exhibit wide vari-ions in their susceptibility to antibiotics.[7] As a further ecaution, sensitivity tests might be performed as recom-ended by Spaulding and Anderson[8] in all fulminating fections, in infections not responding after 72 hours of tibiotic therapy, and in those showing relapses during erapy or evidence of changes in bacterial flora.

ETABOLIC ASPECTS OF TREPTOMYCIN RESISTANCE

Although the exact mechanism by which streptomycin fects its antimicrobial action is not known, there is con-derable evidence to indicate that it involves the inhibi-on of certain metabolic activities of nonproliferating lls of susceptible strains of bacteria.[1] Consequently, forts have been directed toward demonstrating differ-nces in metabolic activities between streptomycin-sistant and streptomycin-sensitive bacteria. Thus Selig-ann and Wassermann[2] reported that acquired resist-nce is accompanied by certain marked alterations in etabolic activities which they attributed to damage to nzyme systems. Umbreit[3] found that susceptible strains f Escherichia coli, but not resistant or dependent vari-nts, possessed an oxidative reaction that is inhibited by reptomycin; he concluded that strains capable of grow-g in the presence of streptomycin have eliminated the action inhibited by the drug. Recently, English and IcCoy[4] have compared the growth of the sensitive arent and a number of resistant mutants of Micrococcus yogenes var. aureus in nutrient broth and in a semisyn-hetic medium. They found that, while sensitive and resistant mutants grew equally well in nutrient broth, the esistant mutants showed a much greater growth than the ensitive parent in the semisynthetic medium. When arious complex nitrogenous supplements were added to his medium, the growth of the parent organism was timulated to a level comparable to that of the resistant nutant. Further study showed biotin to be the stimu-atory factor in these supplements. The addition of biotin lso stimulated the growth of the resistant mutants, indi-ating that, although these organisms are apparently apable of adequate biotin synthesis, they grow more apidly when biotin is added to the medium than when hey have to synthesize biotin and subsequently utilize it. The ability of the streptomycin-resistant organism to ynthesize biotin was indicated by the fact that the growth f streptomycin-sensitive cultures was stimulated by the ddition of hydrolyzed cultures of resistant mutants. Further studies indicated that a reciprocal relationship xisted between ability for excellent growth in the semi-ynthetic mediums and streptomycin-resistance. Cultures of the streptomycin-sensitive parent were grown on semi-synthetic mediums. Out of 121 such cultures, one was found to possess a much heavier growth; this culture was found to be highly resistant to streptomycin. English and McCoy conclude that this finding not only indicates a mutual relationship between growth characteristics and streptomycin resistance but also provides evidence in support of the mutational origin of resistance, since resistance was gained in the absence of streptomycin or any related compound.

MEDICAL CARE EXPENDITURES

Americans are getting more and better medical care for the same proportion of their budget. This conclusion is reached in an analysis of personal consumer expenditures for medical care and for other items in the consumer's budget presented by the Bureau of Medical Economic Research on page 1354 of this issue.[1] The proportion of the consumer's budget spent for medical care in the last 20 years has hovered around 4%. Over the 20-year period the physicians' average share of the "medical care dollar" fell 12%, from 31.8 cents to 28.1 cents; the hospitals' share rose 66%, from 13.9 cents to 23.1 cents. Since the commonly used base period, 1935-1939, the physicians' share of the medical care dollar fell 10% while the hospitals' share rose 37%.

Medical care prices have lagged considerably behind all prices as measured by the Consumers' Price Index since 1935-1939. Average weekly earnings in manufacturing have increased so much more rapidly than medical care prices that a production worker today can buy almost twice as much medical care with one week's wages as he could with one week's wages in 1935-1939.

The data on prices and personal consumer expenditures for medical care clearly indicate a phenomenal increase in "output per physician" and in per capita consumption of medical care since the base period. Over and above this favorable behavior of medical care prices and costs to the consumer is the great improvement in the quality of medical care which the changes in quantity and prices can never reflect.

THE PRESIDENT'S PAGE

A MONTHLY MESSAGE

Earlier this week it was announced that physicians attending the A. M. A. Clinical Session in Los Angeles will be privileged to hear a discussion of major national issues by two eminent United States Senators—Republican Robert A. Taft of Ohio and Democrat Harry F. Byrd of Virginia. They will address a special meeting of the Association's House of Delegates at 7 p. m., Pacific Time, on Wednesday, December 5. The meeting is to be held in the Shrine Auditorium, so that more than 6,000 additional physicians and members of the general public can be accommodated. The speeches will also be broadcast over the American Broadcasting Company network, reaching a vast audience of Americans in their homes from coast to coast. The program will go on the air, over all major ABC stations, at 10 p. m. in the Eastern Time Zone and at 9 p. m. in all other areas.

It is altogether fitting that the American Medical Association should provide a platform for these two distinguished Senators. It is fitting because the A. M. A. is a nonpartisan, professional organization made up of about an equal number of Republicans and Democrats. Those of us who make up this professional cross section of America have been waging a vigorous battle against the socialization of medicine. It has been fought on a strictly nonpartisan basis. We took our stand on the principle of individual freedom, and we welcomed the support of all who would fight with us against the choking disease of socialism, regardless of their party affiliation. Both Republicans and Democrats have given us strong support.

The invitation to Senators Taft and Byrd to address the American Medical Association House of Delegates is fitting for another reason. It is tangible evidence of the reawakened, militant citizenship of thousands of physicians who today are taking an increasingly active part in politics at all levels of government.

Medicine is a demanding profession. It is also fascinating. Because of this, it is all too easy to become completely absorbed in practice. In the past, many of us have concentrated so hard on medicine that we have ignored our country's claim to some of our time and talent. We have said, in effect, "Let others who are less busy shoulder the responsibility of government."

We failed to realize that if we did not take up the tools of citizenship ourselves, others would be only too happy to wield them for us and would use them to build a wall around our profession and around the people who are our patients. This wall would be built in the name of security—security against all types of problems that can attack a man in his lifetime. The trouble with such walls is that they more often turn out to be the barricades of a prison than the ramparts of a fortress. Fortunately, we realized what was happening before the socialistic wall was completed. We have time, though not much, to take up our neglected tools of citizenship and to help rebuild our government around the basic framework of the Constitution. Another year, however, may be all the time we have. It will require the dedicated efforts of every physician if we are to succeed in preserving the American way of life.

What can we, as physician-citizens, do in the comin We must look first to our particular responsibility—the of the people. Now, more than ever, we must bend our to provide the finest possible medical care. Our profession tolerate the slip-shod doctor or the fee gouger. They mu fearlessly disciplined. It matters not that others are out to "all that the traffic will bear" or are avidly seeking "som for nothing." We who have chosen medicine as a life's have dedicated ourselves to the noblest of goals—the wel of our fellow man. By living up to this goal, we can provi shining example of free men working skillfully and honestly gether to improve conditions of life and doing so wit coercion and without regimentation.

Next year—election year—is a time of decision for the Am can people. Can the corrupt, power-seeking socialist plan be turned out of office they now hold? If not, our country expect to travel still further down the road to state contr the ensuing years. For medicine this m socialization, and socialization means terioration of those high standards of which we have built so painstakingly. A us want to practice good medicine, but will you and I be able to do so if we see patients at three-minute intervals in to make enough money to support families? How will we be able to pr good medicine if the government tells cut down on drugs? If we allow this dar of socialization to come, even our na association will be relatively powerle help. For proof, consider the ineff struggles of our British colleagues wi dictatorial Minister of Health.

We cannot afford to say, "It won't h here." Oscar Ewing and his supporters Committee for the Nation's Health the Physician's Forum are as busy as ever. Witness his r proposal for "free" hospitalization for all those over 65. Wi the gift of $10,000 that Senator Murray presented to the mittee for the Nation's Health last month after he had rec it from the CIO. Perhaps the most far-reaching attack letter from President William A. Green to every AFL me extolling the work of the Committee for the Nation's Healt urging them to contribute funds for its support.

The calculated attack on the medical profession is bu phase of a campaign to convert our government to soci It is a quest for power only thinly glossed over with goo tentions. Certainly the American people have had ample o tunity to observe the corrupting effects of such power in months. They are sick of mink coats and freezers.

Next year brings an opportunity—perhaps the last— rid of the socializers, no matter which party label they us camouflage. Thousands of independent American citizen grimly determined that it will be done. Leading this mar the polls is an ever-growing number of physicians who answered the call for courageous citizenship. Stand with u freedom, integrity in government, for the brave future of cine and of our country.

John W. Cline, M.D., San Francis

ORGANIZATION SECTION

RVEY OF OPINIONS OF MEDICAL ARE IN MACON COUNTY

A survey was conducted by the Macon County Medical So- ty[1] to determine medical care opinions and needs among the ,853 residents of Decatur, Ill., and surrounding towns and rms of Macon County. Three hundred residents, a cross sec- n sample, were interviewed during August and September.

Percentages of approval of medical and surgical care and ctors, by those who expressed an opinion, ranged from 91% 71%. Personal interest of the doctor in his patient received e highest approval, while surgical fees received the lowest.

Drug bills and hospital bills received the greatest criticism nong the 30 questions in the survey. Forty-four per cent of ose expressing an opinion said that drug bills were too high, d 43% said that hospital bills were too high.

The survey showed also that 91% of the families questioned Decatur and Macon County said they have a family doctor. ghty-eight per cent of the families expressing an opinion said ey were able to get a doctor to make a house call any time the day or night when they needed him, and another 4% said ey could get him sometimes.

Widely varying opinions on doctor, hospital, and drug bills re expressed. Eighty-eight per cent of those expressing an inion said that office call charges were about right; 87% said at home call charges were about right; 71% said that surgical es were about right; 56% said that hospital bills were about ght; 56% said that drug bills were about right.

Ninety-one per cent of those expressing an opinion said that e quality of medical care was either excellent or good; 89% id surgical care was excellent or good; 72% termed the quality f hospital care excellent or good. The quality of nursing care ceived similar percentages.

Eighty-one per cent of the families in the community have ome form of hospitalization insurance. Seven out of every 10 f these also had some insurance for surgical bills. Eighty-four er cent of those having health insurance were satisfied with e policies they had.

Ninety-three per cent said that the secretaries, nurses, and chnicians in doctors' offices were courteous, and many added e word "very." The waiting time in doctors' offices was not so cceptable. Only 77% said it was reasonable, and 22% com- lained that it was unreasonable.

Ninety-one per cent felt that their own doctor had a personal nterest in them. They were less sure that other doctors had a ersonal interest in their patients as individuals and as people.

Seventy-two per cent of those expressing an opinion thought hat Macon County doctors were very much interested in mak- ng their community a better place to live; another 22% said hat they were moderately interested.

Do Macon County citizens like doctors as people? Ninety- our per cent of those expressing an opinion said they did, but 29% said that they would like to change them. Mentioned ftenest were that they would like doctors less egotistical and ndependent, less vague and more frank in explaining what was wrong, less hurried in their examination and treatment, less erious and less cold, and with more community interest. Some who said that they did not like doctors as people still did not want to change them.

Eighty-nine per cent of those who expressed an opinion felt avorably about the Macon County Medical Society as an organization. Eighty-two per cent thought well of the American Medical Association. More than half the residents of Macon County either had not heard of the Macon County Medical Society or did not know enough about it to express an opinion, and slightly less than half did not express an opinion about the American Medical Association for the same reasons.

There was no striking difference in percentages for the low income group compared with the middle and high income group in their answers to the different survey questions. This was also true for the group over 40 years of age compared with the group under 40.

One out of every 330 persons in Decatur and Macon County was interviewed personally on the 30 basic questions about medical and health care. The sample was selected on a representative cross section and on the basis of the "law of averages," so that the expressed opinions would reflect the attitudes of the citizens of the whole county. Included in the 300 interviews were 116 community leaders, 139 Decatur households, 26 country town households, 7 farm homes, and 12 office workers.

The community leaders included executives of newspapers, radio stations, industrial plants, and small businesses, city and county government officials, and officers and executives of 56 community organizations, including labor, civic, fraternal, professional, veterans, women's, school, youth, welfare, health, church, and farm groups. Every type of trade, craft, and job was represented in the households sample—homemakers, machinists, carpenters, truck drivers, clerks, packers, compressor operators, barbers, common laborers, beauty operators, farm owners, farm tenants, and others. The interviews were divided proportionately: 146 males and 154 females; 151 over 40 years of age and 149 under; 151 with over $3,600 annual income per family and 149 under; 264 urban and 36 rural.

The Macon County Medical Society requested Lawrence W. Rember, Chicago, director of field service for the Public Relations Department, American Medical Association, to advise and assist in conducting the survey. Mrs. John R. Castle, 425 W. Macon, Decatur, local interviewer for the National Opinion Research Center associated with the University of Chicago, worked with Mr. Rember on the interviewing.

The questionnaire was designed to be objective and constructive. It was carefully checked with the American Medical Association's Bureau of Medical Economic Research and two national firms known for doing scientific opinion research, to make sure that it carried out these principles.

The request by the Macon County Medical Society for a representative of the American Medical Association to assist in conducting the survey was approved by the national organization because the Decatur and Macon County area was a most representative county society area—in population, industrially, and rurally—and because this area had been chosen in several national studies as a United States test-tube county. The results of the survey will be presented at a national conference sponsored by the American Medical Association in Los Angeles on December, 2, under the title "An Urban-Rural Opinion Test Tube."

The study will be offered as a pattern next year for county medical societies across the nation in strengthening their public relations and improving their medical services. This is the only study of its kind in the United States that the American Medical Association will assist with staff help at the survey site.

The survey proved definitely that people like to talk about their medical experiences. Community reaction to the survey was typified by such comments as "The Questionnaire is very well constructed." "This is the way to find out where they stand and *where public prejudices and gripes are*." "*I think this is* a smart idea; I am glad to see them doing this." "This is a very progressive step." Results of the survey will be used by the Macon County Medical Society in shaping [illegible] mber of constructive new services which it has recentl [illegible] ill announce in the near future. These pu [illegible] a

---

A more detailed report of this survey will be presented at the Public Relations Conference at the Biltmore Hotel, Los Angeles, December 2. Additional information can be obtained from the Public Relations Department, American Medical Association, 535 N. Dearborn St., Chicago 10.

[1] Members of the Public Relations Committee of the Macon County Medical Society are Drs. C. Elliott Bell, Chairman; John E. Madden; R. Zink Sanders; William Requarth; Vernon Long; and Forrest Martin.

grievance committee to listen to complaints and questions about medical care and fees and to act on them, an emergency call system to help patients obtain a doctor at any time that one is needed, and a health insurance campaign to increase knowledge of, and enrolment in, health insurance plans.

THE AREA SURVEYED

Macon County and Decatur are in central Illinois, 40 miles from Springfield, the State Capital. The county covers 577 square miles. The 1950 census shows the population of Macon County as 98,853, with 66,269 people living in Decatur city limits. According to the 1940 census, 96.4% of the population are native born; of these, 93.4% are native born white and 3.5% are nonwhite. The number of persons per family is 3.2.

The manufacturing payroll, according to the 1947 census, totaled $29,500,000; the total farm income, according to the 1948 census, totaled $23,500,000. Retail establishments, wholesale establishments, and selected service trade, according to the same census, totaled sales receipts of $273,901,000. Decatur is the "soy bean capital of the world," with five large processing plants. Corn products, livestock, poultry, dairy products, and other agricultural products are also processed in sizable volume. Decatur is also an agricultural trade center.

Manufacturing products flow out of 159 firms. Metals in the form of automobile parts, steel finished work, locomotives and cars, castings, plumbing and heating equipment, and many other heavy and light industrial and consumer products carry the stamp "Made in Decatur." Wood, textiles, and plastics are fashioned into numerous products. Drugs and chemicals, paper, and other products combine to make Decatur a city of diversified industry.

Decatur, the county seat, has a university, a 3% Negro population, a number of regional offices, and a surrounding farm acreage of 339,973 in the county. These factors, along with the agricultural and manufacturing factors, made Decatur and Macon County an ideal test-tube for surveying public opinion and attitudes.

Macon County has 104 practicing physicians and surgeons, and 101 of these are members of the Macon County Medical Society. Ninety-five doctors reside in Decatur and nine in surrounding country towns. Three general medical and surgical hospitals, privately owned, have a total of 560 beds, a tuberculosis hospital has 80 beds, and a city contagious hospital has 20 ds open and 20 beds closed.

Following, question by question, are the results of the survey:

AVAILABILITY OF MEDICAL CARE

1. *Do you have a family doctor?*

Yes	91%
No	9

Slightly more people in the middle and high income group had family doctors than in the low income group—92% against 89%.

2. *Have you seen your family doctor within the past year?*

Yes	89%
No	11

Nine per cent more people over 40 years of age than under 40 reported having seen their family doctor during the past twelve months—93% contrasted with 84%.

3. *Have you ever used a specialist?*

Yes	75%
No	25

The percentages were somewhat higher for the middle and high income group (80%) and the group over 40 years of age (78%) than for the low income group (69%) and the group under 40 years of age (72%).

4. *Was the specialist recommended by your family doctor?*

Yes	39%
No	36
	75%

5. *Are you able to get your doctor (or a doctor) when yo him, regardless of whether it is night, weekday, Sat or Sunday, or a holiday?*

Yes	80%
No	7
Sometimes	3
Don't know	10

Of those who did express an opinion, 88% said that doctor came any hour of the day or night; 4% said that he only sometimes; and 8% said that he would not come. T combined 10% who said they could not get a doctor to c to the house when they needed him or that they could doctor only "sometimes" is approximately the same as the centage who did not have a family doctor. Those who did know explained that an occasion for needing a doctor at home had not arisen.

6. *How soon does your doctor respond?*

Right away	54%
Short delay	25
Long delay	7
Don't know	14

Of those who did express an opinion, 63% said their responded right away; 29% said there was a short delay; 8% said there was a long delay.

COST OF MEDICAL AND SURGICAL CARE

7. *For services rendered, do you think you pay too much little, or about the right amount for home calls?*

Too much	10%
Too little	1
About right	77
Don't know	12

Of those who did express an opinion, 87% said that call charges were about right and 12% said that they we much.

8. *For services rendered, do you think you pay too muc little, or about the right amount for office calls?*

Too much	11%
Too little	0
About right	85
Don't know	4

Of those who did express an opinion, 88% said that call charges were about right and 12% said that they we much.

9. *For services rendered, do you think you pay too muc little, or about the right amount for surgery?*

Too much	16%
Too little	0
About right	40
Don't know	44

Of those who did express an opinion, 71% said that su fees were about right and 29% said they were too high. 44% of those surveyed who did not express an opinion cost of surgery, many explained that they had never had

COST OF HOSPITAL AND DRUG CARE

10. *For services rendered, do you think you pay too muc little, or about the right amount for hospital care?*

Too much	36%
Too little	1
About right	48
Don't know	15

Of those who did express an opinion, 56% considered hospital harges about right, while 43% termed them too high. One of very 14 persons volunteered the comment that he had never een hospitalized.

1. *For services rendered, do you think you pay too much, too little, or about the right amount for prescription drugs?*

Too much	33%
Too little	0
About right	44
Don't know	23

Of those who did express an opinion, 56% said that drug bills ere about right and 44% said they were too high.

QUALITY OF MEDICAL AND SURGICAL CARE

2. *What do you think of the quality of the medical care (that is, other than surgical care) that you are receiving in your community?*

Excellent	38%
Good	53
Fair	9
Poor	0

Ninety-one per cent of those interviewed said that medical care as either excellent or good. Over twice as many of the middle ıd high income group said that medical care was excellent did the low income group (51% to 24%). This was about true f the group over 40 years of age when contrasted with the roup under 40 (49% to 26%).

3. *What do you think of the quality of the surgical care that you are receiving in your community?*

Excellent	35%
Good	26
Fair	5
Poor	2
Don't know	32

Of those who did express an opinion, 89% said surgical care as excellent or good, 51% saying it was excellent, and 38% ying it was good. Many more of the middle and high income roup said that surgical care was excellent as did the low income roup (62% to 36%). This was not so marked in the group over 0 years of age when contrasted with the group under 40 (56% o 46%).

QUALITY OF HOSPITAL AND NURSING CARE

14. *What do you think of the quality of hospital care that you are receiving in your community?*

Excellent	19%
Good	44
Fair	17
Poor	7
Don't know	13

Of those who did express an opinion, 72% termed the quality ɔf hospital care excellent or good, 21% saying it was excellent ınd 51% saying it was good. Twenty per cent said fair; 8% said ɔoor.

15. *What do you think of the quality of the nursing care that you are receiving in your community?*

Excellent	19%
Good	45
Fair	18
Poor	4
Don't know	14

Of those who did express an opinion, 75% thought nursing are either excellent or good, 22% saying it was excellent and 3% saying it was good. Twenty-one per cent said fair; 4% aid poor.

OUT OF TOWN MEDICAL CARE EXPERIENCE

16. *Do you go out of town at all for medical care? If so, where, for what, and why?*

Yes	28%
No	71
No answer	1

More of the middle and high income group and the group over 40 years of age go out of town for medical care than those in the low income group and the group under 40 (34% to 21%).

Where: Seventeen cities in all were named by the 64 persons reporting that they had gone out of town at some time or other for medical care. Chicago led the list with 18 persons; St. Louis and Bloomington were next with 10 each, and Champaign followed with 7.

What: Sixty-four persons named 23 different ailments as the cause for seeking medical care outside Macon County. Eye problems were mentioned by 18 persons, diagnosis by 14, surgery by 6, and general illness by 5.

Why: Those expressing themselves on the "why" of their going out of town for medical care gave six basic reasons for their doing so. Nineteen said going elsewhere was recommended by their Macon County doctor; 15 said they knew the out-of-town doctor; 10 wanted a "double check." Those going out-of-town said they go usually to see specialists, or clinics, and then only occasionally.

EXPERIENCE IN THE DOCTOR'S OFFICE

17. *Are the employees in your doctor's office courteous, discourteous, or in between?*

Courteous	93%
Discourteous	1
In between	3
Don't know	3

18. *Are you taken care of in a reasonable time or an unreasonable time in your doctor's office?*

Reasonable	77%
Unreasonable	22
No answer	1

19. *Do you feel that your own doctor has a personal interest in you?*

Yes	91%
No	7
Don't know	2

The percentage who felt that their doctor had a personal interest in them was about the same as the percentage who had a family doctor.

20. *Do you feel that Decatur (or Macon County) doctors in general are interested, moderately interested, or not interested in their patients as individuals and as people?*

Interested	59%
Moderately interested	26
Not interested	6
Don't know	9

Of those who did express an opinion, 94% felt that doctors practicing in Macon County were interested or moderately interested in their patients as individuals and as people. Of these 65% said interested and 29% said moderately interested. Five per cent more of the middle and high income group said interested or moderately interested, than did the low income group.

PREPAYMENT EXPERIENCE

21. *Do you have voluntary prepaid health insurance?*

Yes	81%
No	19

This health bill protection consisted of nonprofit, commercial group and individual policies for hospitalization and surgical and medical care, health and accident policies, and veterans and church policies.

Kind of hospitalization coverage: Of the 300 interviewed, 242 families had some form of hospital insurance, with 192 having one policy each, 47 having two policies, and 3 having three policies.

Kind of surgical and medical coverage: Of the 242 families who had hospital insurance, 170 also had surgical bill insurance and 147 had medical bill insurance. Surgical and medical bills were usually covered when the patient was hospitalized, but not for office or home care, except for accidents.

22. *If you are not covered by voluntary prepaid health insurance, do you know about such plans?*

Yes	18%
No	1
	19%

Of those who did not have health insurance, 96% said that they knew about its existence, and 4% said that they did not know about it.

23. *Are you satisfied or dissatisfied with the prepaid health insurance that you have?*

Satisfied	64%
Dissatisfied	12
Don't know	5
	81%

Of those who did have health insurance, 84% said that they were satisfied with it, and 16% said that they were not.

DOCTORS AS CITIZENS AND AS PEOPLE

24. *Do you think Decatur (or Macon County) doctors are very interested, moderately interested, or not interested in making their community a better place to live?*

Very interested	58%
Moderately interested	18
Not interested	5
Don't know	19

Of those who did express an opinion, 72% believed their doctors are very interested in making their community a better place to live. Twenty-two per cent said they were moderately interested; 6% said they were not interested.

25. *Do you like doctors as people?*

Yes	91%
No	6
Don't know	3

Of those who did express an opinion, 94% said that they liked doctors as people.

26. *Would you like to change doctors as people?*

Yes	27%
No	67
Don't know	6

Although on the previous question, more than 90% of the families liked doctors as people, only 71% of those who did express an opinion said that they would not like to change them. Some who said that they did not like doctors still did not want to change them.

How would you like to change doctors? Of 78 sugg made on how to change doctors as people, 24 said that do were too egotistical and independent. Fifteen said doctors too vague and should be more frank in discussing what is with patients. Thirteen thought doctors were too serious a cold. Ten said doctors rush the patient too much.

ATTITUDES TOWARD THE MACON COUNTY MEDICAL SO

27. *What is your opinion of the Macon County Medical So Is It favorable, unfavorable, or don't you have an o about it?*

Favorable	40%
Mixed	1
Unfavorable	4
Don't know	55

Of those who did express an opinion, 89% said that t thought favorably of it, 8% said unfavorably, and 3% ha mixed attitude. Over half of the persons interviewed said t they had not heard of the Society or that they did not kn enough about it to express an opinion.

28. *Are you familiar with any of the public services, or munity activities, of the Macon County Medical Soci*

Yes	35%
No	64
No answer	1

Over twice as many families in the middle and high group reported knowing about the Society's community a ities and public services than in the low income group (to 22%). This was true to a much lesser degree in the group 40 years of age when contrasted to the group under 40 (39 32%).

Services named: Only 106 persons out of the total sampl 300 interviewed said that they were familiar with any p services and community activities of the Macon County M Society. Seventy-eight persons mentioned the clinics; 10 school health programs; 9 named aid to cancer patients; 8 ferred to the free service doctors give; 7 mentioned free tions for children. Forty-nine other services were named times or less.

ATTITUDES TOWARD THE AMERICAN MEDICAL ASSOCIATIO

29. *Have you ever heard of the American Medical Associat*

Yes	82%
No	18

The percentage of "yes" answers among the middle and income group was substantially larger than in the low group (95% to 69%). The difference was almost as ma among the group over 40 years of age when contrasted with group under 40 (91% to 73%).

30. *Do you think favorably or unfavorably of the A. M. A.?*

Favorably	42%
Neutral	2
Unfavorably	8
Don't know	48

Of those who did express an opinion, 82% said they thou favorably of the A. M. A.; 15% said they thought unfavorab Over twice as many persons in the low income group did express an opinion about the A. M. A. (either because they not know about it, or did not know enough about it) than th in the middle and high income groups (70% to 31%). The trast was not quite so marked between the group under 40 ye of age and the group over 40 (63% to 38%).

The results of the survey reflect objectively the opinions a attitudes of the people of Macon County on the 30 basic qu tions asked. Other counties would do well to find out if medical care climate in their own area is as favorable. It ta some kind of investigation in each area to bring out the fa

ABSTRACT OF MINUTES OF MEETINGS OF BOARD OF TRUSTEES HELD IN ASSOCIATION HEADQUARTERS, OCT. 19-20, 1951

A two-day session of the Board of Trustees of the American Medical Association was held in the headquarters building October 19-20. Several matters were considered and the following actions were taken:

APPOINTMENTS

The following appointments were made to various committees, editorial boards, and special functions:

Dr. E. S. Hamilton to attend on November 10 the Medical Civil Defense Conference, sponsored by the American Medical Association, the American Hospital Association, and the Association of State and Territorial Health Officers. Dr. L. H. Bauer was selected previously to appear on the program on the first day of the Conference.

Dr. Jesse D. Hamer to the inauguration of Richard Anderson Harvill as president of the University of Arizona, Nov. 16, 1951.

Dr. Otto O. Beck to the inauguration of Harlan Henthorne Hatcher as the eighth president of the University of Michigan, Nov. 27, 1951.

Dr. Hugh R. Butt, Dr. Bruce K. Wiseman, and Dr. Louis Leiter as additional members of the editorial board of the *Archives of Internal Medicine*, for terms of 3 years, 2 years, and 1 year, respectively, each term to begin Jan. 1, 1952.

Dr. J. Lafe Ludwig of Los Angeles to replace Dr. D. H. Murray (who resigned because of the pressure of other duties) on the Committee on Legislation of the American Medical Association, and Dr. W. B. Martin, as an additional member on that Committee.

Dr. James R. Reuling as a representative of the Association on a committee to resolve difficulties concerned with the Armed Forces Blood Donor Program. The American National Red Cross and the Department of Defense also will be represented on this committee.

Dr. Julian P. Price to succeed himself on the Advisory Committee to the State Journal Advertising Bureau for a term of five years.

Mr. C. Joseph Stetler, Secretary of the Council on National Emergency Medical Service, as ex officio member of the Association on the Civil Defense Committee of the Association of State and Territorial Health Officers.

Fred V. Hein, Ph.D., to become one of the authors of the second Yearbook on Health, Physical Education and Recreation, to be published by the Association for Health, Physical Education and Recreation.

COMMITTEE ON RURAL HEALTH

The Board authorized reorganization of the Committee on Rural Health as a Council of the Board of Trustees.

1954 CLINICAL SESSION

November 30-December 3 were selected as the dates for the Clinical Session of the Association to be held in Miami, Fla., in 1954.

NATIONAL COMMITTEE FOR TRAFFIC SAFETY

Continued cooperation with the National Committee for Traffic Safety during the coming year was authorized by the Board of Trustees.

WORLD MEDICAL ASSOCIATION

The Board voted that THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION be sent to all members of the Council of the World Medical Association.

RADIO PROGRAM

A new interview program, entitled "Here's the Doctor," directed toward the housewife and conducted by a physician, was authorized by the Board of Trustees.

COMMITTEE ON CAREERS IN NURSING

To assist in the national student nurse recruitment program for 1952, the Board made an appropriation for the work of the Committee on Careers in Nursing.

INCOME TAX EXEMPTION FOR POSTGRADUATE COURSES

In compliance with previous instructions from the Board, procedures have been initiated within the Bureau of Internal Revenue for a review of the 1921 ruling which denies deductions to physicians for expenses incurred in taking postgraduate courses.

DRUG ADDICTION

The Board authorized the appointment of a committee to study the problems of drug addiction. An announcement will be made at a later date with respect to the composition of the committee.

THE SCIENTIFIC EXHIBIT, CHICAGO SESSION

June 9-13, 1952

Representatives to the Scientific Exhibit have been elected by the various Sections of the Scientific Assembly as follows:

Section on Anesthesiology, Dr. Scott M. Smith, 325 Eighth Ave., Salt Lake City.

Section on Dermatology and Syphilology, Dr. James R. Webster, 122 S. Michigan Ave., Chicago 3.

Section on Diseases of the Chest, Dr. Edwin R. Levine, 109 N. Wabash Ave., Chicago 2.

Section on Experimental Medicine and Therapeutics, Dr. Robert W. Wilkins, Evans Memorial Hospital, 65 E. Newton St., Boston.

Section on Gastro-Enterology and Proctology, Dr. J. P. Nesselrod, 636 Church St., Evanston, Ill., and Dr. Everett D. Kiefer, The Lahey Clinic, 605 Commonwealth Ave., Boston 15.

Section on General Practice, Dr. Charles E. McArthur, 205 E. Seventh Ave., Olympia, Wash.

Section on Internal Medicine, Dr. Wesley W. Spink, University Hospital, Minneapolis 14.

Section on Laryngology, Otology and Rhinology, Dr. Francis W. Davison, Geisinger Memorial Hospital, Danville, Pa.

Section on Military Medicine, Col. William S. Stone (MC) USA, Army Medical Center, Washington, D. C.

Section on Nervous and Mental Diseases, Dr. Leon J. Whitsell, 909 Hyde St., San Francisco 9.

Section on Obstetrics and Gynecology, Dr. Frederick H. Falls, University of Illinois College of Medicine, 1853 W. Polk St., Chicago 12.

Section on Ophthalmology, Exhibit Committee, Dr. Georgiana D. Theobald, 715 Lake St., Oak Park, Ill., Chairman; Dr. Donald J. Lyle, 601 Union Trust Bldg., Cincinnati 2; and Dr. Phillips Thygeson, 87 N. Sixth St., San Jose, Calif.

Section on Orthopedic Surgery, Dr. J. Vernon Luck, 1930 Wilshire Blvd., Los Angeles 5.

Section on Pathology and Physiology, Dr. Frank B. Queen, 4181 S. W. Sam Jackson Park, Portland, Ore.

Section on Pediatrics, Dr. F. Thomas Mitchell, 376 S. Bellevue Blvd., Memphis 4, Tenn.

Section on Physical Medicine and Rehabilitation, Dr. Arthur L. Watkins, Massachusetts General Hospital, Boston 14.

Section on Preventive and Industrial Medicine and Public Health, Dr. Paul A. Davis, 1436 Delia Ave., Akron 2, Ohio.

Section on Radiology, Dr. Richard H. Chamberlain, 3400 Sprue St., Philadelphia 4.

Section on Surgery, General and Abdominal, Dr. Walter G. Maddock, 250 E. Superior St., Chicago.

Section on Urology, Exhibit Committee, Dr. Roger W. Barnes, 1216 Wilshire Blvd., Los Angeles, Chairman; Dr. Rubin H. Flocks, University Hospitals, Iowa City; and Dr. George H. Ewell, 16 S. Henry St., Madison 3, Wis.

Applications for space close on Jan. 15, 1952, but should be submitted as far in advance of that date as possible. Application blanks may be obtained from the Section Representatives or from the Director, Scientific Exhibit, American Medical Association, 535 N. Dearborn St., Chicago 10.

MEDICAL NEWS

CALIFORNIA

Annual Sectional Pathologists Meeting.—The California Society of Pathologists and the Southwestern Section of the College of American Pathologists are holding an annual midwinter meeting December 1-2 at the Ambassador Hotel in Los Angeles. The first day will be dedicated to Dr. Ernest M. Hall, retiring professor of pathology of the University of Southern California School of Medicine. The majority of the scientific contributions of the day are being offered by former students and associates of Dr. Hall. Guest speakers include Dr. Stanley P. Reimann, professor of oncology at Hahneman Medical College and Hospital and director of the Institute for Cancer Research, Philadelphia; Dr. Sidney C. Madden, professor of pathology at the University of California at Los Angeles School of Medicine, and Dr. Riojum Kinosita, visiting professor of pathology, University of California at Los Angeles School of Medicine, and professor of pathology, Osaka Imperial University. At the Tumor Slide Conference on December 2 several tumors of soft parts will be discussed. The moderator of the discussion will be Dr. John W. Budd.

FLORIDA

Seminar in Ophthalmology and Otolaryngology.—The sixth annual midwinter seminar of the University of Florida will be held January 14-19 in Miami Beach. Lectures on ophthalmology will be presented January 14-16, and on otolaryngology on January 17-19. Lecturers for the courses in ophthalmology include Drs. Alson E. Braley, Iowa City; John M. McLean, New York; Wendell L. Hughes, Hempstead, Long Island, N. Y.; Irving H. Leopold, Philadelphia, and F. Bruce Fralick, Ann Arbor, Mich. Otolaryngologists who will lecture include Drs. Fred W. Dixon, Cleveland; Thomas C. Galloway, Evanston, Ill.; Anderson C. Hilding, Duluth, Minn.; Moses H. Lurie, Boston, and Henry L. Williams, Rochester, Minn. On January 16, registrants are invited to attend the midwinter convention of the Florida Society of Ophthalmology and Otolaryngology, which meets urrently with the seminar. All meetings will be held at the [illegible] Souci Hotel. Dr. Walter T. Hotchkiss, Miami Beach, is y, and communications concerning the seminar should [illegible] addressed to him.

ILLINOIS

Society News.—At a recent meeting of the Illinois Section of the American College Health Association, Dr. Otto J. Keller, director of student health service at Northern Illinois State Teachers College in DeKalb, was elected president. Other officers include Dr. Homer L. Lawder, University of Illinois, Champaign, vice-president, and Dr. T. William Lester Jr., University of Chicago, secretary-treasurer.

Chicago

Appointments to Armour Laboratories.—Dr. George F. Kamen, New York, has been appointed an assistant medical director in the clinical investigation service of Armour Laboratories medical department. He has been an assistant medical examiner in the department of forensic medicine of New York University. Dr. Robert J. Feldmann has been named an assistant medical director in the consultant service of the medical department. Before joining the laboratories, he assisted on a research project to study the effects of adrenalectomy on schizophrenia at the University of Chicago.

Prize for Paper on Industrial Medicine.—The Chicago Society of Industrial Medicine and Surgery awards an annual prize of $150 for a meritorious scientific paper in the field of industrial medicine and surgery. Any physician in the Chicago area who has received his M.D. degree within the six years immediately prior to the date closing the contest March 1 for the current year is eligible. The paper must concern unpresented original laboratory or clinical ideas or research data. The manuscript with two carbon copies submitted for the contest should not be signed by the author but should be identified by a detached letter and mailed to the secretary of the society, Dr. Charles Drueck, 28 E. Jackson Blvd., R. 1300, Chicago 4. The paper and award will be presented at the annual meeting of the society.

MICHIGAN

Another Center for Research on Poliomyelitis.—A research center for extensive clinical research on poliomyelitis is to be opened at the University of Michigan Hospital, Ann Arbor, under the joint sponsorship of the university and the National Foundation for Infantile Paralysis. Dr. James L. Wilson, chairman, department of pediatrics and communicable diseases, will have over-all supervision of the center, and Dr. David G. Dickinson will be director. Similar centers were opened last year at Children's Hospital of Boston, Wellesley Hills, Mass., and at Jefferson Davis Hospital, Houston, Texas.

NEW JERSEY

Radioisotope Laboratory.—A radioisotope laboratory has been installed at the Research Laboratories of E. R. Squibb & Sons, New Brunswick. The new unit will be headed by Paul Numerof, a chemist who worked on the atomic bomb project at Los Alamos during World War II. The isotope laboratory will function primarily as a service unit for other research departments, using isotopes and tracers extensively to help determine the action of new drugs.

NEW YORK

Personal.—Dr. Vincent Hernandez, Rear Admiral, M. C., U. S. N., retired, has been appointed associate medical director for the overseas company of E. R. Squibb & Sons. He has had more than 30 years' service in the medical department of the United States Navy.

Dr. Godfrey Given Sedgwick Medal.—The American Public Health Association awarded Dr. Edward S. Godfrey Jr., formerly commissioner of the New York State Health Department, the Sedgwick Memorial Medal for 1951 in recognition of his contributions to the evolution and development of public health practice and his interpretation of the principles of epidemiology. The medal was presented at the annual banquet in San Francisco November 1. Dr. Godfrey, who retired as commissioner of health in 1947, also served as adjunct professor of preventive medicine and public health at the Albany Medical College and as professor of clinical epidemiology at Columbia University College of Physicians and Surgeons, New York.

Hospital Alumni Scientific Conference.—The annual Alumni Scientific Conference of the Hospital for Joint Diseases, New York, is being held December 13-15. On December 13 Dr. W. Russell MacAusland, Boston, will review patients who had the Judet operation at the hospital; in the evening he will deliver the Walter M. Brickner Lecture on the uses of the Judet prosthesis in disabilities and deformities of the hip joint. On Friday morning a symposium on "epiphysiolysis," with Dr. Armin Klein of Boston presiding, will include a review by Dr. Melvin H. Jahss, New York, and Dr. Abel Kenin, Brooklyn, of 208 patients treated at the hospital with a 25-year follow-up. During the afternoon the residents will present their theses, with an award by the alumni association for the best. On Saturday morning Dr. Henry L. Jaffe will conduct a panel on bone tumors, and the afternoon session will deal with advances in orthopedic surgery. A dinner-dance will be held on December 15 in the Grand Ballroom of the Hotel Biltmore, at which time the issue of the hospital's scientific bulletin, honoring Dr. Henry L. Jaffe for his 25 years of service as pathologist and director of laboratories, will be presented to him by Dr. Samuel Kleinberg, New York, editor.

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

New York City

Lectures in Psychosomatic Medicine.—Mount Sinai Hospital is sponsoring a series of eight lectures on recent advances in psychosomatic medicine to be given at 8:30 p. m. in Blumenthal Auditorium each month. Lectures are as follows:

Dec. 19, Psychosomatic Aspects of Obesity, Brunhilde Bruch, New York.
Jan. 9, The Essence of Psychotherapy, Maurice Levine, Cincinnati.
Feb. 6, Psychophysiological Studies of Fistulous Openings into the Gastrointestinal Tract, Sydney Margolin, New York.
Feb. 22, Experimental Psychiatry, Jules H. Masserman, Chicago.
Feb. 27, Emotional Factors in the Etiology and Treatment of Hyperthyroidism, Theodore Lidz, Baltimore.
March 19, Summary of Experimental Evidence Relating Life Stress to Diabetes Mellitus, Lawrence E. Hinkle Jr., New York.
March 26, Emotional Problems of Hypertension, Edward Weiss, Philadelphia.
April 2, An Integration of the Psychosomatic Viewpoint in Medicine, M. Ralph Kaufman, New York.

Appoint Director of Hospital for Speech Disorders.—Dr. David Ross, formerly head of the Seton Institute of Baltimore, has been named medical director of the National Hospital for Speech Disorders, succeeding the late Dr. James S. Greene, who founded the hospital in 1916 and served as its head until his death in 1950. Dr. Ross received training in psychiatry at Maudsley Hospital, London, Cassel Hospital, Penshurst, Kent, and the Aberdeen (Scotland) Royal Mental Hospital. During World War II he served in the Royal Navy as a specialist in neuropsychiatry. At the National Hospital for Speech Disorders more than 78,000 persons with speech disorders have been treated, about 63% of them without charge, in its more than a third of a century of service. The staff includes over 40 physicians, psychologists, speech and voice clinicians, and other therapists, and clinical, administrative, and clerical assistants.

NORTH CAROLINA

Speech and Hearing Problems Center.—A new program, aimed at creating a diagnostic and treatment center for speech and hearing problems in North Carolina, has been started at The Duke University Medical School in Durham. The program attempts to educate parents to help their children by explaining the treatment, step by step, to the parents. Three men who work as a team in treating these problems are Dr. Leslie B. Hohman, professor of neuropsychiatry; Murray Halfond, speech pathology clinician, and Dr. Kenneth L. Pickrell, professor of plastic surgery. Medical speech pathologists handle referrals from the Crippled Children Section of the State Board of Health and the Vocational Rehabilitation Service, as well as other hospital departments and private sources. The program is aimed at developing rapid treatment methods and at establishing a training center for speech correctionists.

PENNSYLVANIA

Historical Marker and Portrait Unveiled.—Memorial services conducted at English Center in Lycoming County for Dr. John Frederick Rheinwald were climaxed by the unveiling of a mountain stone marker. The memorial was sponsored by the Lycoming and Tioga counties' medical and historical societies. Dr. Rheinwald was killed in the winter of 1840 by a panther in that vicinity. The medicine kit he was carrying when killed was one of the relics displayed of olden days. Col. Henry W. Shoemaker, McElhattan; Dr. T. Kenneth Wood, Muncy, and Judge Charles G. Webb, Wellsboro, were the speakers.

A portrait of Samuel Gilson Dixon, LL.D., Sc.D., first commissioner of health of Pennsylvania, was unveiled Aug. 24 in Bryn Mawr. Through his interest in tuberculosis Dr. Dixon, who was commissioner of health from Jan. 6, 1905 to Feb. 26, 1918, established Mont Alto Sanatorium. The Bryn Mawr State Clinic accepted this portrait, together with a silver cup, which were gifts of Dr. Dixon's daughter, Mrs. John S. Sharpe, Haverford.

Philadelphia

Dr. Lucchesi to Be Medical Director of Medical Center.—Dr. Pascal F. Lucchesi, chief of the Bureau of Hospitals and medical director of the Philadelphia General Hospital, has been named executive vice-president and medical director of the Albert Einstein Medical Center, which is being organized through the consolidation and expansion of Mount Sinai Hospital, Jewish Hospital, and Northern Liberties Hospital. Dr. Lucchesi was appointed superintendent of the Philadelphia General Hospital in March, 1946. He received the Strittmater Award of the Philadelphia County Medical Society in 1947.

Committee on Geriatrics.—The Philadelphia County Medical Society has organized a committee on geriatrics with Dr. Joseph T. Freeman as chairman. Other members are Drs. Edward L. Bortz, Charles L. Brown, William Dunbar, Thomas M. Durant, Edmund L. Housel, Richard A. Kern, Pascal F. Lucchesi, Henry F. Page Jr., Sholom O. Waife, and Lauritz S. Ylvisaker.

New Student Program Adds Field Experience.—The University of Pennsylvania has instituted in its School of Medicine a comprehensive new program of teaching, training, and actual field experience for the benefit of medical students. Training the general practitioner for his job in public health service continues throughout the four years, and courses, lectures, observation tours, and field experience are now mandatory for all medical students at the university. The entire Philadelphia metropolitan area is the laboratory in which students work under the new plan. Dr. John P. Hubbard, George S. Pepper professor of public health and preventive medicine, is chairman of the department in which the new program is being carried out. A feature of the curriculum is an opportunity for first-year students to assume gradually increasing responsibility for the medical problems c
a family assigned to the student and followed by him in th
clinic, hospital, and home throughout his four years in medic
school. The doctor-to-be assumes the role of physician for th
family under close faculty supervision and learns many aspec
of medical practice which he does not see in the clinic and th
hospital wards. To date this part of the program has been offere
on an elective basis to a limited number of students; but i
popularity, both with students and faculty, indicates clearly th
it is becoming an increasingly important part of medical trainin
A further innovation is the requirement that all students take u
some type of medical work during the summer between the thir
and fourth years.

Pittsburgh

Mellon Lecture.—The 35th Mellon Lecture was given by Eliz
beth C. Crosby, Ph.D., professor of anatomy, University c
Michigan Medical School, Ann Arbor, at the Mellon Institut
Nov. 6 at 8:30 p. m. on "Central Nervous System Control c
Eye Movements." The Mellon Lectures are sponsored by th
Society for Biological Research of the School of Medicin
University of Pittsburgh.

TEXAS

Hospital News.—The new eight-story Methodist Hospital c
the Texas Medical Center in Houston was dedicated at publi
ceremonies November 10. Major gifts to the building fund c
the new hospital included one million dollars from Mr. and Mr
H. R. Cullen, $500,000 from the M. D. Anderson Foundatio
and $100,000 from the H. C. Wiess family. The new hospit
has many installations for saving time and energy.

Dr. Ewalt Goes to Massachusetts.—Dr. Jack R. Ewalt, dean c
the Postgraduate School of Medicine, Houston, has resigned t
become commissioner of mental health for Massachusetts. D
Ewalt, who was professor of neuropsychiatry of the Universit
of Texas Medical Branch and administrator of the Medic
Branch hospitals in Galveston before going to Houston, wi
also have a teaching appointment in psychiatry at Harvar
Medical School, Boston.

VIRGINIA

Analysis of Study of Multi-Test Clinic.—The first major analys
of the multi-test clinic as a community method of detectin
remediable diseases in apparently well people has been publishe
by the Health Information Foundation, 420 Lexington Ave
New York. The report, based on eight tests given to 40,00
persons in Richmond, indicates that one out of four had sign
of health defects or diseases and one out of eight had diseas
conditions not previously suspected. The Richmond multi-te
clinic examined persons in the area free of charge for signs c

certain chronic diseases, including tuberculosis, heart defects, syphilis, hypertension, anemia, diabetes, obesity, and visual impairments. The survey was conducted early in 1950 by the Richmond residents themselves, through local agencies. A total of 1,592 persons were interviewed by foundation researchers, and information was secured on an additional 1,506. The average cost of the tests per person was $1.62, which was paid by voluntary health agencies, the Richmond Health Department, and the United States Public Health Service. The multi-test clinic in Richmond was planned by the Health Division of the Richmond Area Community Council, in cooperation with the Public Health Service and City Health Department.

WISCONSIN

Postgraduate Course in Gastroenterology.—The University of Wisconsin Medical School, Madison, will present a course in gastroenterology December 11-13 under the direction of Dr. Karver L. Puestow, professor of clinical medicine. The sessions include clinics, lecture-type presentations, and a clinical-pathological conference. Advance registration is required. Due to space limitations, registration must be limited, and the first 30 physicians to request inclusion on the class list will be accepted. Formal registration will be held at 8:30 a. m. December 11 in Building T-14. The fee for the course is $10, payable at the time of registration.

GENERAL

Four Proctologic Societies to Meet.—The quadrangular meeting of the New England, New York, New Jersey, and Philadelphia Proctologic societies will be held December 8 at the Warwick Hotel in Philadelphia following a dinner at 7 p. m. The program is as follows:

Observations of Pilonidal Disease and War Time Experience, Richard A. Hopping, Newark, N. J.
Colostomy Care and Management, A. W. Martin Marino, Brooklyn.
Surgical Procedure for Complete Prolapse of the Rectum, E. Parker Hayden, Boston.

Cerebral Palsy.—Between 15,000 and 22,000 babies of the 3 million born each year in the United States have an incapacitating neurological handicap in the form of cerebral palsy alone, or in combination with a convulsive disorder or mental retardation, according to Dr. Charles F. McKhann, Cleveland, medical rector of the United Cerebral Palsy Associations. In the United s alone some 550,000 persons are known to have had bral palsy since birth. Additional thousands, including many ults, acquire this disorder as a result of injury or disease.

Study of Multiple Sclerosis in Denmark.—A research program to perfect a technique of evaluating the course of multiple sclerosis and experimental treatments used for it is underway in Copenhagen, Denmark, as a result of a grant made by the National Multiple Sclerosis Society, New York. The investigation will be conducted by Dr. Paul Thygesen of Denmark, who has conducted research in multiple sclerosis for many years. To accurately follow the course of multiple sclerosis, patients are being given complete neurological examinations about every three weeks.

Psychoanalytic Association Meeting.—The midwinter meeting of the American Psychoanalytic Association will be held December 6-9 at the Waldorf-Astoria Hotel, New York, under the presidency of Dr. Robert P. Knight, Stockbridge, Mass. In addition to presentation of papers, the following roundtable discussions will be held on December 8:

Problems of Symptom Formation, with Special Emphasis on Phobic Symptom Formation, George Gerö, Ph.D., New York, chairman.
Schizophrenia in Childhood, Mary O'Neill Hawkins, New York, chairman.
Psychotherapy in Medical and Surgical Hospitals, Bernard Bandler, Boston, chairman.
Danger and Leadership: A Problem of Group Psychology, Otto E. Sperling, Brooklyn, chairman.

Urology Award.—The American Urological Association offers an annual award of $1,000 (first prize of $500, second prize $300, and third prize $200) for essays on the result of some clinical or laboratory research in urology. Competition is limited to urologists who have been in such specific practice for not more than five years and to men in training to become urologists. The first prize essay will appear on the program of the meeting of the American Urological Association at the Chalfonte-Haddon Hall, Atlantic City, N. J., June 23-26, 1952. For details write the secretary, Dr. Charles H. de T. Shivers, Boardwalk National Arcade Building, Atlantic City, N. J. Essays must be in his hands before Feb. 15, 1952.

Meeting of Medical Clinics.—The American Association of Medical Clinics will hold its annual session at the Hotel Mayfair, Los Angeles, December 3. The professional problems session will begin at 2 p. m. following the luncheon, at which Dr. John W. Cline, San Francisco, President of the American Medical Association, will be the speaker. Dr. Jean S. Felton, Oak Ridge (Tenn.) National Laboratory, will speak on "Industrial Medicine and the Group Clinic—A Mutually Advantageous Relationship." He will be followed by Dr. Russel V. Lee, Palo Alto, Calif., who will speak on "Research in Clinics by Outside Physicians." The meeting will close with a panel discussion on "Relations of Clinics to the Medical Profession and the Public," with Dr. Bernard A. Watson, Clifton Springs, N. Y., as moderator.

Fund to Preserve Old Yellow Fever Hut.—Near the town of Quemado in Cuba is an old wooden shack, the remaining one of two structures in which Dr. Walter Reed and his associates conducted experiments in 1900 leading to the conquest of yellow fever. Building No. 1, "the infected bedding building," where volunteers slept for 21 nights without contracting the fever, was rediscovered in 1940 by Dr. Philip S. Hench of the Mayo Clinic, Rochester, Minn., and two companions. Dr. Hench, who has made an avocation of the Walter Reed epic, has sought for 10 years to have something done about preserving the ancient building. From $50,000 to $100,000 is needed to preserve it. The Cuban government has designated it a national monument and allocated $50,000 for protecting the building, but nothing constructive has been done. Dr. Hench volunteered to stand the cost of temporarily fortifying the structure, but the offer was declined because the Cubans wished to do the work themselves.

Cerebral Palsy Organization Names Medical Director.—Dr. Charles F. McKhann, Cleveland, has been appointed to the newly-created position of acting medical director for United Cerebral Palsy Association. He will coordinate medical activities in the united attack on cerebral palsy in cooperation with the organization's two volunteer medical bodies. These are the Research Council, headed by Dr. Sidney Farber of Children's Medical Center and Harvard Medical School, Boston, and the Medical Advisory Committee, of which Dr. Winthrop M. Phelps, director of Children's Rehabilitation Institute, Cockeysville, Md., is chairman. Dr. McKhann is a consultant in pediatrics to the Surgeon General of the U. S. Army and president of the American Board of Pediatrics, Philadelphia. He is also president of the Medical and Chemical Associates Research Laboratories in Cleveland, which is seeking and testing drugs effective in cerebral palsy and convulsive disorders. He taught at Harvard Medical School and Harvard School of Public Health, at Peiping Union Medical College in China, and at the University of Michigan at Ann Arbor.

Graduate Fellowships in Radiological Physics.—The Oak Ridge Institute of Nuclear Studies is receiving applications for Atomic Energy Commission Graduate Fellowships in Radiological Physics for the 1952-1953 school year. They are for study at two training centers, one at the University of Rochester, N. Y., in cooperation with Brookhaven National Laboratory, and the other at Vanderbilt University, Nashville, Tenn., in cooperation with Oak Ridge National Laboratory. In both cases the final three months of the fellowship will be spent at the national laboratory. Appointments are made for one year for specialized training in radiological physics. The annual basic stipend is $1,500. An additional $500 is allowed for a wife and $250 for each of two dependent children. University tuition and fees will be paid by the Oak Ridge Institute of Nuclear Studies. Applicants to be considered must hold an undergraduate degree at the time of entering the fellowship period and must be citizens of the United States. Information may be obtained from the heads of science and engineering departments of colleges and universities or from the University Relations Division, Oak Ridge Institute of Nuclear Studies, P. O. Box 117, Oak Ridge, Tenn. Applications must be received by the institute by March 1, 1952.

Society Elections.—Officers of the American Therapeutic Society for 1951-1952 include Dr. Wendell B. Gordon, Pittsburgh, president; Dr. Oscar B. Hunter, Washington, D. C., secretary, and Dr. Howard Wakefield, Chicago, treasurer.——The Central Neuropsychiatric Association, meeting in St. Paul and Minneapolis October 19-20, chose the following officers for the coming year: Dr. Raymond Walter Waggoner, Ann Arbor, Mich., president; Dr. Lee M. Eaton, Rochester, Minn., vice-president; Dr. Hamilton F. Ford, Galveston, Texas, secretary-treasurer, and Dr. Frank H. Luton, Nashville, Tenn., counselor. The next meeting will take place in Nashville, Tenn., at an undetermined date in October, 1952.——Following the annual meeting of the American Society of Anesthesiologists, Inc., in Washington, D. C., November 5-8, the following physicians assumed office: Dr. C. Walter Metz, Denver, president; Dr. Ralph T. Knight, Minneapolis, president-elect; Dr. J. Earl Remlinger Jr., Evanston, Ill., reelected secretary, and Dr. Moses H. Krakow, Bronx, N. Y., reelected treasurer.

Animal Research in United States.—The legal status of animal research in the United States is illustrated in map form in a new booklet, "Expediting Medical Progress," recently published by the National Society for Medical Research. The map shows which states now provide for the use of unclaimed animals in scientific studies, which states provide definite legal recognition of animal experimentation, and states with laws limiting biological research. Also indicated are those cities which provide for the use of unclaimed pound animals in scientific studies. Four states (Minnesota, Wisconsin, South Dakota, and Oklahoma) and 27 cities now have specific laws or ordinances which save otherwise doomed pound animals for research use. Three states (Maine, Massachusetts, and Pennsylvania) now have laws which limit biological research. Fifteen states provide definite legal recognition of animal experimentation, and 26 are without either law or recognition in this respect. The book outlines the barriers to medical progress that have been promulgated by various antimedical research groups and describes the ways in which these barriers have been broken down through the program of the National Society for Medical Research. Copies of the booklet may be obtained from the society's headquarters, 185 N. Wabash Ave., Chicago 1.

Dermatology and Syphilology Meeting.—The annual meeting of the American Academy of Dermatology and Syphilology will be held in Chicago at the Palmer House December 8-13 with Dr. Donald M. Pillsbury, Philadelphia, presiding as president. Principal sessions will be held in the Palmer House December 10-13, with special courses in histopathology and mycology scheduled for December 8-9 at the medical schools of the University of Illinois and Northwestern University. Special courses in x-ray and radium therapy, bacteriology of the skin, anatomy and embryology of the skin, and special problems in dermatohistopathology will be held Saturday and Sunday at the Palmer House. Special lectures will be given on "Bacterial Infections of the Skin," by Dr. Pillsbury; "Recent Experience in the Use of Cortisone with Corticotropin (ACTH)," by Dr. Rachmiel Levine, Chicago; "The Present Status of Research in Cancer," by Dr. Cornelius P. Rhoads, New York; "Clinical Significance of Disturbances in Sweat Delivery," by Dr. Marion B. Sulzberger, New York, and "Newer Knowledge of Pituitary-Adrenal Physiology," by Dr. Jerome W. Conn, University of Michigan, Ann Arbor.

International Society for Geographic Pathology.—This society, whose activities were interrupted by the war, has been reorganized. Infectious hepatitis will be the subject for the next conference to be held in Liege, Belgium, July 15-18, 1952. The national committees in various countries are now collecting data on this subject for presentation at the conference. The International Society for Geographic Pathology was organized in 1938 by Prof. M. Askanazy of Geneva, Prof. L. Aschoff of Freiburg, and Prof. R. de Josselin de Jong of Utrecht. National committees were organized in some 26 countries. Dr. Virgil H. Moon of the University of Miami organized the National Committee for the United States. The method of procedure was to choose some disease entity and for the committees to gather all pertinent evidence concerning its etiology, clinical features, pathologic features, geographic variations, and distribution in each of the several countries. This information was collected, abstracted, and presented as a basis for the program of each triennial conference. Subjects discussed have been cirrhosis of the liver, arterial sclerosis, and the anemias. Those who plan to attend the conference should make travel reservations far in advance. For information address Dr. Virgil H. Moon, Secretary, Medical Research Unit, University of Miami, Coral Gables, Fla.

International Congress of Internal Medicine.—The second International Congress of Internal Medicine will be held in London from Sept. 15-18, 1952, at Friends House, Euston Road, London. N.W.1. Members of the International Society of Internal Medicine who intend to be present should send their names to the secretary of the Congress Committee. Communications should be addressed to Sir Harold Boldero, Royal College of Physicians, 12 Pall Mall, East, London, S.W.1, not later than April 1, 1952. Nonmembers of the society who plan to attend should send in their names through their National Associations so that they reach the congress secretary in London by April 1, 1952. Dr. Albert M. Snell, 300 Homer Avenue, Palo Alto, Calif., would be glad to know of any who may be interested in such attendance. The following program has been drafted:

Sept. 15, afternoon, Disturbances of Intestinal Absorption with Particular Reference to Disorders of Fat Absorption.
Sept. 16, morning and afternoon, Clinical Aspects of Disturbances of Fluid and Electrolyte Balance.
Sept. 17, Some Aspects of Neurotropic and Myotropic Virus Disease.
Sept. 18, morning, visits to hospitals.

Abstracts of the communications of the chief speakers will be translated into English, French, and German and will be printed in advance by the Congress Committee so that they can be available to delegates.

International Discussion of Alcoholism.—Twenty internationally known specialists led discussion groups at the first European seminar and lecture course on alcoholism in Copenhagen October 29-November 2. The conference was sponsored by the Danish Government, in cooperation with the World Health Organization and the United Nations, and the participants represented 11 countries. Lectures were given on the following subjects: alcoholism as a public health problem, alcohol metabolism, alcohol and nutrition, alcoholic mental disorders, tetraethylthiuramdisulfide (antabuse®) in the treatment of alcoholism, drinker types, the neurotic alcoholic, the criminal alcoholic, the alcoholic woman, and group therapy. The conference heard also a lecture on the work of "Alcoholics Anonymous." The faculty of the seminar and lecture course was headed by E. M. Jellinek, Sc.D., of the World Health Organization, and Dr. Max Schmidt of Copenhagen. Other lecturers were Dr. Stjepan Betlheim, Zagreb; Dr. Leon Derobert, Paris; Dr. P. Esser, Amsterdam; Dr. Robert E. Fleming, Cambridge, Mass.; Dr. S. Forssman, Stockholm; Dr. L. Hakola, Helsinki; Dr. A. Jojer, Stockholm; Dr. E. Jacobsen, Copenhagen; Dr. G. Lundquist, Stockholm; Dr. I. Matte, Santiago de Chile; Dr. Jules H. Masserman, Chicago; Dr. Max Mueller, Berne, Switzerland; Dr. Ø. Ødegard, Oslo; Dr. H. Pullar-Strecker, London, and Dr. V. Wedell-Wedellsborg, Copenhagen.

FOREIGN

Personal.—Dr. Herbert Pieter, professor of clinical medicine at the University of San Domingo, Dominican Republic, has been decorated by the French Government with the plaque of Chevalier de la Légion d'Honneur.

Typhoid in Sicily.—A total of 935 cases of typhoid fever was reported in Sicily for the month of September, according to the U. S. Public Health Service. An epidemic has been occurring in Augusta on the east coast. Over 300 cases have been reported in this area.

Drug Research Institute in India.—The Council of Scientific and Industrial Research of India established six national laboratories during 1950 and will launch five more in 1951. According to a statement in *Nature,* the seventh of the series will be devoted to research on drugs. The city of Lucknow, in which is located a university with a medical school and a teaching hospital, was selected. The government of the state offered the historic Chatter Manzil Palace as a gift to the council to house the proposed Drug Research Institute. The institute, it is reported, will promote drug research, test and standardize drugs discovered by the institute, provide expert advice for their further development and production, offer research facilities and advice to scientific workers, universities, and industry, organize controlled clinical trials of drugs in clinics, and disseminate scientific knowledge relating to drugs. The institute was developed under the guidance of Sir Edward Mellanby, who is to be succeeded by Dr. B. Mukerjee, director of the Drug Institute in Calcutta. The institute likewise has had the advantage of guidance of Col. R. N. Chopra. According to Colonel Chopra, the cost of essential drugs in India has been mounting higher and higher, whereas the masses in India are too poor to obtain treatment even for minor ailments. Sir Edward Mellanby emphasized that for nation's health drugs can at best form the second line of defense; the first line must always be the public health services. He also pointed out that whereas a large number of the plants from which drugs in the pharmacopeia are made are already grown in this country, many of these drugs are imported in large quantities.

DEATHS IN OTHER COUNTRIES

Dr. Donald S. McEachern, associate professor of neurology at McGill University Faculty of Medicine, Montreal, and senior neurologist at the Montreal Neurological Institute, died at his home October 31, aged 47. He was president of the Canadian Neurological Society.

EXAMINATIONS AND LICENSURE

NATIONAL BOARD OF MEDICAL EXAMINERS

ATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II,* Jan. 28-30. All enters where there are five or more candidates. Final date for filing plication is Dec. 17. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., iladelphia 2.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY: Various Locations, July 18. Final date for filing application is Jan. 18. Sec., Dr. C. B. Hickcox, 80 Seymour St., Hartford 15.

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY: *Written.* Various centers. March 1952. *Oral.* Chicago, May 1952. Final date for filing application is Feb. 1, 1952. Candidates for these tests must have completed three years of approved training prior to July 1, 1952. Sec., Dr. George M. Lewis, 66 E. 66th St., New York 21.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral.* Chicago, May 1952. Final date for filing applications for the May 1952 examination is Jan 1, 1952. Sec., Dr. W. J. German, 789 Howard Ave., New Haven 4, Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY: *Written.* Feb. 1, 1952. Final date for filing applications was Nov. 1. *Oral.* Chicago, June 9-13, 1952. Final date for filing application is Feb. 1, 1952. Sec., Dr. Robert L. Faulkner, 2105 Adelbert Road, Cleveland 6.

AMERICAN BOARD OF OPHTHALMOLOGY: *Written.* Twenty-five centers, Feb. 4-5, 1952. Sec., Dr. Edwin B. Dumphy, 56 Ivie Road, Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: Final date for filing applications for the 1952 Part II examinations was Aug. 15. Final date for filing application for the 1952 Part I examination is Nov. 30. Sec., Dr. Harold A. Sofield, 122 S. Michigan Ave., Chicago 3.

AMERICAN BOARD OF PEDIATRICS: Written examination under local monitors, Jan. 11. This is the only written examination which will be given during 1952. *Oral.* New York City, Feb. 1-3; St. Louis, Mo., April; Washington, D. C., May 3-5; San Francisco, late June; Chicago, October and Boston, late November. Exec. Sec., Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PHYSICAL MEDICINE AND REHABILITATION: *Parts I and II.* Chicago. June 9-10. Sec., Dr. Robert L. Bennett, Georgia Warm Springs Foundation, Warm Springs, Ga.

AMERCIAN BOARD OF PSYCHIATRY AND NEUROLOGY: *Oral* New York, Dec. 17-18. Final date for filing applications was Sept. 1. Act. Sec., Dr. David A. Boyd Jr., 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF RADIOLOGY: *Oral.* Spring 1952. Final date for fi application is Dec. 31. Sec., Dr. B. R. Kirklin, 102-110 Second Av., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written.* Various Centers. March 195 Final date for filing application was Dec. 1, 1951. *The following writ examination will be given in October 1952.* Sec., Dr. J. Stewart Rodm 225 S. 15th St., Philadelphia.

BOARD OF THORACIC SURGERY: Various parts of the country. *Written.* Feb 29, 1952. Final date for filing application is Jan. 15. Sec., Dr. Willia M. Tuttle, 1151 Taylor Ave., Detroit 2.

AMERICAN BOARD OF UROLOGY: Chicago, Feb. 9-13, 1952. Final date f filing applications was Sept. 1. Sec., Dr. Harry Culver, 30 Westwood Rd., Minneapolis 16.

MEETINGS

AMERICAN MEDICAL ASSOCIATION CLINICAL SESSION, Los Angeles, Dec. 4-7. Dr. George F. Lull, 535 N. Dearborn St., Chicago 10, Secretary.

AMERICAN ASSOCIATION OF MEDICAL CLINICS, Mayfair Hotel, Los Angeles, Dec. 3-4. Dr. Edwin P. Jordan, Box 114, Charlottesville, Va., Executive Director.

AMERICAN PSYCHOANALYTIC ASSOCIATION, Waldorf-Astoria Hotel, New York, Dec. 6-9. Dr. LeRoy M. A. Maeder, 1910 Rittenhouse Square, Philadelphia 3, Secretary.

AMERICAN SOCIETY FOR SURGERY OF THE HAND, Palmer House, Chicago, Jan. 25-26. Dr. J. H. Boyes, 1401 S. Hope St., Los Angeles 15, Secretary.

ANNUAL CONGRESS ON INDUSTRIAL HEALTH, William Penn Hotel, Pittsburgh, Jan. 18-19. Dr. Carl M. Peterson, 535 N. Dearborn St., Chicago 10, Secretary.

ASSOCIATION FOR RESEARCH IN NERVOUS AND MENTAL DISEASES, Hotel Roosevelt, New York, Dec. 14-15. Dr. Clarence C. Hare, 170 Maple Ave., White Plains, N. Y., Secretary.

INTERNATIONAL MEDICAL ASSEMBLY OF SOUTHWEST TEXAS, Municipal Auditorium, San Antonio, Jan. 22-24. Dr. John J. Hinchey, P. O. Box 2445, San Antonio 6, Secretary.

MEDICAL PUBLIC RELATIONS CONFERENCE, Biltmore Hotel, Los Angeles, Dec. 2-3. Mr. Leo E. Brown, 535 N. Dearborn St., Chicago 10, Director.

PUERTO RICO MEDICAL ASSOCIATION, Santurce, Dec. 12-16. Dr. Victor J. Montilla, P. O. Box 3866, Santurce, Secretary.

RADIOLOGICAL SOCIETY OF NORTH AMERICA, Chicago, Dec. 3-7. Dr. Donald S. Childs, 713 E. Genesee St., Syracuse 2, N. Y., Secretary.

SOUTHERN SURGICAL ASSOCIATION, The Homestead, Hot Springs, Va., Dec. 4-6. Dr. John C. Burch, 2112 West End Ave., Nashville 5, Tenn. Secretary.

INTERNATIONAL

AUSTRALASIAN MEDICAL CONGRESS, Melbourne Victoria, Australia, Aug. 22-30. Dr. C. H. Dickson, Medical Society Hall, 426 Albert St., East Melbourne, Victoria, Australia, Hon. General Secretary.

COMMONWEALTH AND EMPIRE HEALTH AND TUBERCULOSIS CONFERENCE, Central Hall, London, England, July 8-13. Dr. J. H. Harley Williams, Tavistock House North, Tavistock Sq., London, W.C.1, England, Secretary General.

INTERNATIONAL COLLEGE OF SURGEONS, Madrid, Spain, May 20-24. Dr. Max Thorek, 850 West Irving Park Road, Chicago, Ill., U. S. A., Secretary-General.

INTERNATIONAL CONGRESS ON MENTAL HEALTH, Mexico City, Mexico, Dec. 11-19. Mrs. Grace E. O'Neill, Division of World Affairs, National Association on Mental Health, 1790 Broadway, New York 19, N. Y., U. S. A.

INTERNATIONAL CONGRESS ON NEUROPATHOLOGY, Rome, Italy, Sept. 8-13. Dr. Armando Ferraro, 722 W. 168th St., New York, N. Y., U. S. A., Secretary General.

INTERNATIONAL CONGRESS OF PHYSICAL MEDICINE, *London, England,* July 14-19. Dr. A. C. Boyle, 45, Lincoln's Inn Fields, London, W.C.2, England, Hon. Secretary.

LATIN AMERICAN CONGRESS OF PHYSICAL MEDICINE, Panama City, R. P., Feb. 24-29. Dr. Cassius Lopez de Victoria, 176 East 71st St., New York, N. Y., U. S. A., Executive Director.

NEURORADIOLOGIC SYMPOSIUM, Stockholm, Sweden, Sept. 17-20. Docent Ake Lindbom, Symposium Neuroradiologicum, Serafimerlasarettet, Stockholm K., Sweden, Secretary.

PAN AMERICAN CONGRESS OF OPHTHALMOLOGY, Mexico City, Mexico, Jan. 6-12. *Dr. Luis Sanchez Bulnes, Gomez Farias 19, Mexico 4,* D.F., Secretary-General.

PAN AMERICAN CONGRESS OF OTORHINOLARYNGOLOGY AND BRONCHOESOPHAGOLOGY, Havana, Cuba, Jan. 20-24.

PAN AMERICAN CONGRESS OF PEDIATRICS, Montevideo, Uruguay, Dec. 5-8. Dr. Maria Luisa Saldien de Rodriguez, Avenida 18 de Julio, 1246, Montevideo, Uruguay, General Secretary.

PAN AMERICAN MEDICAL WOMEN'S ALLIANCE, Montevideo, Uruguay, Dec. 2-8. Dr. Elizabeth Mason Hohl, 1234 North Vermont Ave., Los Angeles 27, Calif., U. S. A., President.

DEATHS

Adson, Alfred Washington ⊕ Rochester, Minn., professor of neurosurgery at University of Minnesota Graduate School, died in Midway Hospital, St. Paul, November 12, aged 64, of coronary occlusion. Dr. Adson was born in Terril, Iowa, March 13, 1887. He received his medical degree at the University of Pennsylvania School of Medicine in Philadelphia in 1914. On July 1, 1914, he entered the Mayo Clinic as a fellow in surgery and became a member of the permanent staff on Jan. 1, 1917. He was head of the section of neurological surgery until October, 1946, when he became senior consultant. During World War I he was a first lieutenant in the medical reserve corps of the United States Army. In 1922 he was commissioned a major in the Officers Reserve Corps, and later a colonel. He was a member of the National Research Council's subcommittee on neurosurgery. Dr. Adson was a specialist certified by the American Board of Psychiatry and Neurology and the American Board of Neurological Surgery, of which he was chairman. He was a member of the founders group of the American Board of Surgery, past president of the Minnesota State Medical Association, a fellow of the American College of Surgeons, a member of the American Surgical Association, Western Surgical Association, Society of Neurological Surgeons, American Neurological Association (former president), Association for Research in Nervous and Mental Diseases, Association of Military Surgeons of the United States, International Surgical Association, International Neurological Association, World Medical Association, Société Internationale de Chirurgie, Central Neuropsychiatric Association, Western Surgical Association (vice-president in 1936), Minnesota Society for Neurology and Psychiatry (president in 1943), Minnesota Neurological Society, Minneapolis Surgical Society, and an associate member of the Minnesota Academy of Medicine. He was a member of Phi Rho Sigma, Alpha Omega Alpha, and Sigma Xi, and an honorary fellow of the Greek Surgical Society and the International College of Surgeons. From 1941 to 1948 Dr. Adson was a member of the House of Delegates of the American Medical Association. He served two three-year terms on the Association's Council on Medical Service and was chairman of the council's seven-member committee on prepayment of hospital and medical service. Since 1929 he had been a member of the state board of medical examiners, serving as president for two years. He was a member of the Medical Council of the Veterans Administration, the council on medical service and public relations, advisory committee for the medical unit of the division of social welfare of the Minnesota Department of Social Security, member of the Commission on Associated Medical Plans; chairman of the Minnesota State Medical Service Committee, and president of the Northwest National Conference. In 1948 he was awarded the honorary doctor of science degree from the University of Nebraska. In 1933 Dr. Adson presented the third annual Walter M. Brickner Lecture at the Hospital for Joint Diseases in New York and the third annual Mayo Lecture on Surgery at Northwestern University Medical School in Chicago. He was a contributor of more than 242 articles to medical journals.

Groedel, Franz Maximilian ⊕ New York; born in Bad Nauheim, Germany, May 23, 1881; Universität Leipzig Medizinische Fakultät, Saxony, Germany, 1904; instructor at the University of Frankfurt from 1919 to 1934 and later professor on the medical faculty; served as director of Kerckhoff Heart Research Institute in Bad Nauheim, where he was cardiologist to the Heart Sanitarium from 1904 to 1934; chief of the x-ray department at the Holy Ghost Hospital, Frankfurt am Main, Germany, from 1910 to 1934; came to the United States in 1934; research fellow at the Biological Laboratories at Fordham University; consulting cardiologist, Lenox Hill Hospital; attending cardiologist, Beth David Hospital; cardiologist, St. Anthony's Hospital; past president of Deutsche Röntgengesellschaft and Frankfurter Röntgengesellschaft; formerly member of the board of directors of the German Heart Association and Deutsch Balneologische Gesellschaft; member of the American Heart Association, New York Heart Association, New York Cardiologist Society, American Association of the History of Medicine, and International Society of Medical Hydrology; honorary member of the X-ray Society of Chicago, American College of Radiology, Medical Society of Bologne, Italy, and Hessian Roentgen Society; served as military surgeon during World War I; co-author with Dr. Paul R. Borchardt of "Direct Electrocardiography of the Human Heart"; author of many books, brochures, and articles on x-ray examination and diseases of the heart; died October 12, aged 70, of cerebral hemorrhage.

Federspiel, Matthew N. ⊕ Milwaukee; born Sept. 15, 1879; Milwaukee Medical College, 1910; also held a D.D.S. degree; member of the founders group of the American Board of Surgery; specialist certified by the American Board of Plastic Surgery, Inc.; fellow of the American College of Surgeons; life member of the Milwaukee Academy of Medicine; member of the American Dental Association, Wisconsin Academy of Dentists, and the American Society of Orthodontists; associate clinical professor of plastic and maxillofacial surgery, emeritus, at Marquette University School of Medicine, where he served on the medical faculty for 22 years and on the dental staff for 38 years; affiliated with Milwaukee County Hospital, St. Joseph's Hospital, and St. Michael's Hospital; author of the book, "Harelip and Cleft Palate," published in 1927; died in Minocqua September 6, aged 72, of pulmonary infarct.

Wilcox, DeWitt Gilbert ⊕ Newton, Mass.; born in Akron, Ohio, January 15, 1858; Homeopathic Hospital College, Cleveland, 1880; an Associate Fellow of the American Medical Association; professor emeritus of gynecology at the Boston University School of Medicine; fellow of the American College of Surgeons; past president of the New England Physical Therapy Society; served on the staff of Newton-Wellesley Hospital in Newton Lower Falls; on the staff of the Westboro (Mass.) State Hospital from 1920 to 1932; formerly practiced in Buffalo, N. Y., where he was for many years on the staffs of Buffalo Homeopathic Hospital and Erie County Hospital, and surgeon-in-chief at Lexington Heights Hospital; died September 26, aged 93, of cardiorenal failure.

Hartley, Harriet Louise ⊕ Philadelphia; born in New York, November 14, 1874; Woman's Medical College of Pennsylvania, Philadelphia, 1903; served as professor of preventive medicine, hygiene, and public health at Temple University School of Medicine; member of the American Public Health Association; past president of the Pennsylvania Public Health Association, which in 1944 presented her an award of merit for outstanding work in child hygiene; for many years chief of child hygiene for the Philadelphia Bureau of Health; awarded the honorary degree of doctor of science from Philadelphia College of Pharmacy and Science in 1943; died October 18, aged 76.

Bucher, Carl Joseph ⊕ Philadelphia; born in Logansport, Ind., in 1890; University of Pennsylvania School of Medicine, Philadelphia, 1916; associate professor of pathology at Jefferson Medical College of Philadelphia; member of the American Association of Pathologists and Bacteriologists, College of American Pathologists, Society of American Bacteriologists, and the American Society of Clinical Pathologists; specialist certified by the American Board of Pathology; served during World War I; director of the clinical laboratories of Jefferson Medical College Hospital; died October 9, aged 61.

Anderson, William Sailer, Memphis, Tenn.; Medical Department of Tulane University of Louisiana, New Orleans, 1900; member of the American Medical Association; died September 27, aged 74, of coronary occlusion and Parkinson's disease.

Austin, John Watson, High Point, N. C.; Jefferson Medical College of Philadelphia, 1910; died August 20, aged 68, of carcinoma of the prostate.

⊕ Indicates Fellow of the American Medical Association.

Bakal, Sondra Florence, Brooklyn; Long Island College of Medicine, Brooklyn, 1934; on the staff of the Kings County Hospital; died in Mount Sinai Hospital, New York, August 22, aged 42.

Barnes, John Wesley, Hudson, Mich.; Columbus (Ohio) Medical College, 1892; died July 23, aged 83.

Barnett, James Miller ⊕ Albany, Ga.; Atlanta College of Physicians and Surgeons, 1902; fellow of the American College of Surgeons; surgeon, Phoebe Putney Memorial Hospital; died September 12, aged 72, of coronary thrombosis and hypertension.

Barnhardt, Harry A. ⊕ Pittsburgh; Medico-Chirurgical College of Philadelphia, 1897; on the courtesy staffs of Passavant and Pittsburgh hospitals; died August 11, aged 82, of coronary occlusion.

Bartlett, Oliver Leslie, Pittsfield, Mass.; College of Physicians and Surgeons, medical department of Columbia College, New York, 1887; member of the American Medical Association; for many years on the staff of Pittsfield General Hospital; died October 8, aged 91.

Billingsley, Clarence B., Fort Smith, Ark.; Memphis (Tenn.) Hospital Medical College, 1910; member of the American Medical Association; affiliated with St. Edward's Mercy Hospital and Sparks' Memorial Hospital, where he died September 11, aged 69, of a heart attack.

Blackburn, Mary Baker, Marion, S. C.; University of Nashville (Tenn.) Medical Department, 1899; died September 3, aged 74.

Blackwood, Leslie W., Oak Park, Ill.; The General Medical College, Chicago, 1923; medical examiner for the Pennsylvania Railroad for many years; on the staff of South Shore Hospital in Chicago; died August 6, aged 58, of coronary thrombosis.

Bonney, Charles Austin Jr. ⊕ New Bedford, Mass.; University of Vermont College of Medicine, Burlington, 1898; an associate fellow of the American Medical Association; fellow of the American College of Surgeons; served on the staff of St. Luke's Hospital, died in Taunton recently, aged 74, of bronchopneumonia.

Booth, William Mason, Hartselle, Ala.; Vanderbilt University School of Medicine, Nashville, Tenn., 1902; died August 7, aged 77, of cerebral concussion.

ell, Harry Matthew, Waynetown, Ind.; University of ville (Ky.) Medical Department, 1893; member of the ican Medical Association; served during World War I; in Culver Hospital, Crawfordsville, September 28, aged 83, of cerebral hemorrhage.

Bowers, Merlin Hulbert, Mackinaw Island, Mich.; Detroit College of Medicine, 1910; died in Port Huron September 28, aged 67, of tumor of the pancreas.

Bratrude, Amos Presily, Antioch, Ill.; University of Illinois College of Medicine, Chicago, 1924; served during World War II; died in the Veterans Administration Hospital, Hines, October 8, aged 51, of bilateral subdiaphragmatic abscess due to carcinoma of sigmoid colon with perforation.

Bressler, Alexander H. ⊕ Wamego, Kan.; University of Louisville (Ky.) Medical Department, 1894; died in Genn Hospital September 18, aged 79, of cerebral hemorrhage and hypertension.

Broady, George A., Houston, Texas; Physio-Medical College of Indiana, Indianapolis, 1891; died September 12, aged 86, of pneumonitis.

Brunson, Peter Alexander ⊕ Ridge Spring, S. C.; Medical College of Virginia, Richmond, 1906; died in the Camden (S. C.) Hospital September 10, aged 74, of carcinoma.

Burns, Guy Wendell, St. Petersburg, Fla.; Chicago Homeopathic Medical College, 1895; died August 11, aged 82, of cerebral hemorrhage.

Bu Steed, Harry C. J., Ottawa, Ill.; Chicago College of Medicine and Surgery, 1913; member of the American Medical Association; died September 6, aged 73, of carcinoma of the lower bowel.

Colvert, George Washington, Miami, Okla.; Washington U versity School of Medicine, St. Louis, 1906; served during World War I; formerly on the staff of Miami Baptist Hospital; died in Veterans Administration Hospital, Muskogee, September 1, aged 71, of peritonitis and diverticulitis.

Dixon, Howard Bucknam ⊕ San Francisco; Hahnemann Medical College of the Pacific, San Francisco, 1913; affiliated with Southern Pacific, St. Luke's, and Mary's Help hospitals; died September 21, aged 62.

Dougherty, Barbara E., Chariton, Iowa; Ensworth Medical College, St. Joseph, Mo., 1892; died July 20, aged 83, of carcinoma of the sigmoid.

Dull, Cecil Fay ⊕ Richland Center, Wis.; Rush Medical College, Chicago, 1926; for many years health officer; served overseas during World War I; died October 13, aged 55, of lung abscess and carcinoma of the gallbladder.

Ebersole, Francis Fisher ⊕ Mount Vernon, Iowa; Johns Hopkins University School of Medicine, Baltimore, 1906; past vice-president of the Linn County Medical Society; for many years on the staff of St. Luke's Hospital in Cedar Rapids; died in Oxford, Neb., August 7, aged 73, of injuries received in an automobile accident.

Eckstein, Arthur William, Grand Meadow, Minn.; Northwestern University Medical School, Chicago, 1912; died July 19, aged 64

Ehrenfried, Albert ⊕ Boston; Harvard Medical School, Boston 1905; fellow of the American College of Surgeons; consultin surgeon at the Beth Israel Hospital, Boston City Hospital, Chi dren's Hospital, and the Jewish Memorial Hospital; died i Massachusetts General Hospital September 25, aged 71, adenocarcinoma of the right kidney with metastases.

Fagen, Rodney Pierce, Des Moines, Iowa; Drake Universi College of Medicine, Des Moines, 1912; served during Wor War I; *member of the American Medical Association*; former state health commissioner and secretary of the state board medical examiners; at one time county physician; died in Mer Hospital September 20, aged 65, of carcinoma.

Fiore, Autino, Cambridge, Mass.; Tufts College Medical Scho Boston, 1942; certified by the National Board of Medical E aminers; member of the American Medical Association; co missioner of public health; served during World War II; on t staff of Mount Auburn Hospital; died October 21, aged 34, coronary thrombosis.

Gately, Tracy Thomas ⊕ New Orleans; Tulane University Louisiana School of Medicine, New Orleans, 1917; speci certified by the American Board of Radiology; served duri World War I; member of the Radiological Society of No America and the American College of Radiology; served on t staffs of Hotel Dieu and Mercy Hospital, where he died Augu 3, aged 56, of cirrhosis of the liver.

Gentry, Isaac Lloyd, Maysville, Okla.; Tennessee Medical C lege, Knoxville, 1897; died in N. H. Lindsey Memorial Hospit Pauls Valley, August 28, aged 83.

Germain, Harry Homer ⊕ Belleair, Fla.; Harvard Medi School, Boston, 1898; member of the Massachusetts Medi Society; fellow of the American College of Surgeons; forme consulting surgeon, Sturdy Memorial Hospital, Attleboro, a Beverly (Mass.) Hospital, and surgeon-in-chief, Charlesgate H pital, Cambridge; died October 5, aged 76, of pneumonia.

Gibbs, Meyler David ⊕ Santa Fe, N. Mex.; College of Phy cians and Surgeons, Keokuk, Iowa, 1896; from 1937 to 19 represented Harding County in the state house; died in St. Vi cent Hospital October 22, aged 82, of arteriosclerosis.

Goraczewski, Thaddeus Clemens, South Bend, Ind.; Marque University School of Medicine, Milwaukee, 1936; member of t American Medical Association; died in St. Joseph Hospi August 23, aged 44, of coronary occlusion.

Graham, Clarence Flack, Laconia, N. H.; Johns Hopkins U versity School of Medicine, Baltimore, 1913; formerly on t faculty of the Albany (N. Y.) Medical College; member of t American Trudeau Society; served on the staff of the Herma M. Biggs Memorial Hospital in Ithaca, N. Y.; died in Exet August 7, aged 64, of coronary occlusion.

uzzetta, Denis Philip, Milwaukee; Harvard Medical School, oston, 1926; member of the American Medical Association; rmerly clinical instructor in surgery at Marquette University hool of Medicine; served on the staffs of Milwaukee County ospital and Misericordia Hosptial; died in Columbia Hospital ptember 23, aged 49, of cerebral hemorrhage.

agic, Franklin Eugene ⊕ Richmond, Ind.; College of Physians and Surgeons of Chicago, School of Medicine of the Unirsity of Illinois, 1911; fellow of the American College of rgeons; served during World War I; affiliated with Reid emorial Hospital; consulting surgeon, Richmond State Hostal; died September 12, aged 65, of myocardial insufficiency.

all, Clyde William, Youngstown, Ohio; Ohio State University ollege of Medicine, Columbus, 1933; served as police surgeon; ed in Sharon (Pa.) General Hospital September 11, aged 47, injuries received when his automobile was struck by a train.

arrell, William S. Sr., Ruston, La.; Medical Department of ulane University of Louisiana, New Orleans, 1891; died Octor 6, aged 82.

awkins, James E., Caraway, Ark. (licensed in Arkansas in)09); died October 5, aged 71, as the result of suffocation from noke.

eileman, Jacob H., Waynesfield, Ohio; Starling Medical Colge, Columbus, 1897; died August 5, aged 87.

eller, Augustus Phillip, Centralia, Ill.; Chicago College of edicine and Surgery, 1910; member of the American Medical ssociation; past president of the Marion County Medical Soety; died in Illinois Central Hospital, Chicago, October 26, ged 65, of myelogenic leukemia.

ill, Edgar Ward Jr., Marietta, Ohio; Ohio State University ollege of Medicine, Columbus, 1916; member of the Amerian Medical Association; served during World War I; past presient, vice-president, and secretary-treasurer of Washington ounty Medical Society; on the staff of the Marietta Memorial Iospital; died September 2, aged 61.

Iowell, Elsey W., Oakton, Ky.; Hospital College of Medicine, ouisville, 1907; member of the American Medical Association; ied July 30, aged 72, of uremia, arteriosclerosis and diabetes nellitus.

Iutchison, Charles Wesley ⊕ Los Angeles; College of Physiians and Surgeons of Chicago, School of Medicine of the Uniersity of Illinois, 1908; for many years on the staff of Hollyood Presbyterian Hospital, where he died September 18, aged 8, of acute coronary occlusion.

llyes, Levi Roscoe, Palestine, Ill.; Central College of Physiians and Surgeons, Indianapolis, 1898; member of the American Medical Association; died recently, aged 78, of coronary occlusion.

Keith, Algenon Watson, Stamps, Ark. (licensed in Arkansas n 1903); member of the American Medical Association; died September 28, aged 70, of a heart attack.

Klemm, William John, Culver City, Calif.; Starling Medical College, Columbus, Ohio, 1900; died August 9, aged 80, of heart lock.

Knight, Thomas Estin, Farmville, Va.; Medical College of Virginia, Richmond, 1929; served during World War II; affiliated with Southside Community Hospital, where he died August 16, aged 48, of carcinoma of the lung.

Kruskal, Isaac David ⊕ Brooklyn; University and Bellevue Hospital Medical College, New York, 1907; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; consulting ophthalmologist at the Maimonides and Jewish hospitals; died recently, aged 71.

Lowry, James Barnett ⊕ Lakeland, Fla.; Vanderbilt University School of Medicine, Nashville, Tenn., 1894; University of Nashville (Tenn.) Medical Department, 1895; died July 22, aged 83, of arteriosclerotic heart disease.

MacBurney, LeRoy, Great Falls, Mont.; Bennett Medical College, Chicago, 1911; member of the American Medical Association; served during World War I; for many years county coroner and federal jail physician; died October 5, aged 65.

Manning, Harris W. ⊕ Emporia, Kan.; Rush Medical College, Chicago, 1897; member of the American Academy of Dermatology and Syphilology; on the staffs of the Newman Memorial County Hospital and St. Mary's Hospital, where he died September 8, aged 83, of cerebral hemorrhage.

Nast, Alfred G., Los Angeles; New York Homeopathic Medical College and Flower Hospital, New York, 1921; at one time on the faculty of the University of Michigan Medical School in Ann Arbor and the University of California Medical School in San Francisco; in 1925-1926 medical director of schools in Miami, Fla., where he was chief of the epidemiological service of the department of health; died August 11, aged 53, of arteriosclerotic heart disease.

Palmer, Jobe Judson, Needmore, Pa.; the Hahnemann Medical College and Hospital, Chicago, 1903; died July 3, aged 75, of cerebral hemorrhage.

Ruch, Jake D., Indianapolis; Indiana University School of Medicine, Indianapolis, 1947; served a residency at Indianapolis General Hospital where he died recently, aged 27.

Turner, Edward Wright, Belmont, Ohio; Ohio Medical University, Columbus, 1900; member of the American Medical Association; died in Ohio Valley General Hospital, Wheeling, W. Va., August 22, aged 76, of coronary thrombosis.

Unger, Abraham, New York; Columbia University College of Physicians and Surgeons, New York, 1912; served during World War I; on the staff of Mount Sinai Hospital; died September 10, aged 62, of coronary disease.

Vaden, Marshall Tate ⊕ Buena Vista, Va.; Medical College of Virginia, Richmond, 1915; for many years physician and surgeon for the Chesapeake & Ohio Railway Company; affiliated with Jackson Memorial Hospital in Lexington, where he died August 8, aged 64, of cerebral hemorrhage.

Van De Erve, Hubert, Menlo Park, Calif.; Rush Medical College, Chicago, 1905; formerly practiced in Carrington, N. D., where he was health officer and county coroner; died August 28, aged 77, of coronary thrombosis.

Van Lue, Joyce Warwick ⊕ Gettysburg, Ohio; Medical Department of the University of Cincinnati, 1913; served during World War I; member of the school board; on the staff of Wayne Hospital in Greenville; died in Massey, Ont., Canada, September 1, aged 59, of coronary infarction.

Wade, Carl Odis, Santa Ana, Calif.; University of Tennessee College of Medicine, Memphis, 1946; died September 16, aged 37.

Waynes, Blaine Arlington, Tulsa, Okla.; Meharry Medical College, Nashville, Tenn., 1916; one of the founders of Moton Hospital, where he died September 13, aged 64.

Weber, Joseph George, Chicago; Bennett Medical College, Chicago, 1915; member of the American Medical Association; on the staff of St. Elizabeth's Hospital, where he died Sept. 27, aged 67, of chronic myocarditis.

Williamson, James Holland, Danville, Ill.; Missouri Medical College, St. Louis, 1898; member of the American Medical Association; died September 9, aged 79, of carcinoma of the kidney.

Winn, John Harvey ⊕ Columbus, Ga.; Vanderbilt University School of Medicine, Nashville, Tenn., 1916; served during World War I; died September 17, aged 63.

Withington, Alfreda Bosworth, North Adams, Mass.; Woman's Medical College of the New York Infirmary for Women and Children, New York, 1887; member of the American Medical Association and the Massachusetts Medical Society; died in the Pittsfield (Mass.) General Hospital October 1, aged 91, of hypertensive heart disease and arteriosclerosis.

Woodroof, William Lowe, Newnan, Ga.; Atlanta College of Physicians and Surgeons, 1912; member of the American Medical Association; died August 27, aged 70, of cerebral hemorrhage.

GOVERNMENT SERVICES

PUBLIC HEALTH SERVICE

Dysentery Among Korean War Prisoners.—The alarmingly high rate of dysentery among Chinese and North Korean prisoners of war in Korea has been reduced 75% by a team of Army, Navy, and civilian experts comprising Colonel Richard P. Mason of the Army Medical Service, Dr. Albert V. Hardy, consultant to the Armed Forces Epidemiological Board, and Dr. James Watt, chairman of the Commission on Enteric Infections of the armed forces.

When this team was called to Korea last April, dysentery was raging among 150,000 Chinese and North Korean prisoners, most of whom had contracted the disease before surrendering to American forces. An average of 80 prisoners a day out of the group of 150,000 was being admitted to the dysentery wards of American POW hospitals. Dysentery has been widespread among the Korean population for centuries.

The Army-Navy team acted swiftly, instituting intensive treatment procedures, including use of such antibiotics as terramycin, aureomycin, and chloramphenicol; it constructed new sewage facilities; and it set up a system for delousing all incoming prisoners, dusting them with DDT, and giving them haircuts, showers, and clean clothes.

These measures were taken on the island of Koje-do, 25 miles off the south coast of Korea, where the prisoners were concentrated. The team set up ward and treatment tents and used personnel of the Navy Fleet Epidemic Disease Control Unit and one of the Navy's laboratory ships for diagnostic procedures.

The solution of the waste disposal problem was a spectacular achievement. Three mountain streams which flowed into the bay on which the POW compound was situated were dammed. To accomplish this South Korean and POW labor was used over a period of six months to construct temporary-style dams in each of the three river valleys, thus creating artificial lakes which could be tapped with no energy other than the force of gravity. Then underground conduits were dug throughout the compound and an adequate supply of clean water was made available for drinking, bathing, laundering, and waste disposal.

The result of these and other measures was a sharp reduction in the incidence of dysentery and other intestinal diseases. The team is continuing its research and treatment activities and plans to return to the United States early next year.

Besides Colonel Mason and Drs. Hardy and Watt, team members include Ensign David C. Hamerick, U. S. Navy; Captain Frederick J. Payne of the Army Medical Service; Drs. Marion M. Brooke, Kelsey C. Milner, Paul Weinstein, Don Machel, and Don Schliessman of the U. S. Public Health Service; Dr. William Frye, dean of the Louisiana State University School of Medicine, and Dwight Frazier of the Bureau of Laboratories of the Florida State Board of Health.

Public Health Section in Burma.—Dr. Phillips F. Greene, formerly associate professor of surgery at the Medical College of the State University of New York, Brooklyn, from 1944-1950 associate dean at the Long Island College of Medicine, and for years head of the Department of Surgery, Yale in China (a medical school in China staffed by Yale University), has begun his assignment with the Public Health Section of the Economic Cooperation Administration Mission in Burma, joining 21 other Public Health Service officers who are stationed with the Burma Mission.

The general objectives of the section are to improve the health and economy of the country by establishment of modern disease control and sanitation programs. Special projects will include programs to improve medical and nursing education, demonstration, and control projects for venereal disease and malaria control, and training in environmental sanitation. In addition to Dr. Leroy R. Allen, head of the section, the staff consists of 10 physicians, 4 nurses, 7 engineers, and 1 scientist.

Dr. Greene is the third Public Health Service Officer to be assigned to the Medical College of the University of Rangoon, where he will teach surgery. Dr. George Adams is professor of pathology at the school and is also director of the laboratory of the college and hospital. Dr. Robert Page is acting as prof of pharmacology.

A special demonstration and teaching project has been e lished in Aung San Village, located near Rangoon. The vi is a rehabilitation camp established by the Burmese Go ment for insurgents who have surrendered. This project designed to train the subprofessional health workers that wi required for the sanitation and disease control programs pla by the Government. Dr. E. N. Hesbacker is in charge of demonstration.

The venereal disease control program is under the dire of Dr. William W. Harris. Rapid treatment methods are de strated in Rangoon under a special project headed by Dr. O nald H. Sheppard. A malaria control demonstration that phasizes residual spraying has been established in Akyab, i southern part of Burma. The project is directed by Dr. Agna. Two other public health demonstrations are being ducted in Bassein and Taunggyi. They provide traini maternal and child health, sanitation, and the control of municable diseases. Dr. Sherwin Isaacson is in charge demonstration at Bassein. The demonstration at Taung under the direction of Dr. Martin P. Hutt.

Survey of Working Conditions in India.—The Public Service announces that a team of three experts on ind hygiene has been appointed to assist the government of in a six-month survey of working conditions in selected indu

The survey, which was requested by the Indian Gover under the United States Point IV Program, will be con in cooperation with the technical staff of India's Minis Labor to determine the nature and extent of exposure to hazards of workers in three chief industrial centers.

The three-man team will make technical measuremen help develop safety and health standards and set up tech and procedures for putting sound safety and health pr into use. Special attention will be given to regular insp of work places, work injury record keeping, use of testing ratories, and implementation of labor laws. An importar of the work will be training of industrial safety and hea spectors. A series of seminars for selected personnel e in research and laboratory work will also be conducted team.

Environment and Health.—The Public Health Service ann publication of "Environment and Health," a book whic cusses health measures applied to the natural environ water, air, food, and the forms of animals and plant life affect public health, and man-made environment—the the school, the working place, the park, swimming pool playground—along with health aspects of man-made radi The final chapters deal with administration of environn health programs and research. A chapter on environn health deals specifically with new trends and developme

A limited edition of "Environment and Health" has been lished for distribution to health departments, sanitary schools of public health, and other professional audiences. C are available from the Superintendent of Documents, Go ment Printing Office, Washington 25, D. C., at 75¢ each.

Infant Mortality Decreased Seven Per Cent.—Infant mor rates in the United States decreased 7% in the last year, ac ing to the Office of Vital Statistics of the Public Health Se The estimated rate in 1950 was 29.2 deaths under 1 yea 1,000 live births, compared to a rate of 31.3 for 1949. The n part of the difference was for deaths of infants of 28 days thr 11 months, although some decrease occurred in the numb deaths of infants under 28 days old. Deaths in the neonatal p account for nearly 70% of all infant deaths. Since 1925 the mortality rate has declined 59%.

Among the leading causes of infant death are congenital formations, influenza and pneumonia, postnatal asphyxia, at tasis, and birth injuries. The group of diseases of the dige system that includes gastritis, enteritis, colitis, and diarrhea tinues as an important cause of death in infancy.

TALY

onvention of Cardiologists.—At the 13th National Convention the Italian Society of Cardiology in Naples, the first report as on cor pulmonale, which was discussed by Professor uddu, of the University of Rome. The second report, which was the heart in pulmonary tuberculosis, was presented by Dr. i Maria, also from the University of Rome. An additional 192 pers were presented. The next convention of Italian cardiolo-sts will be held in Taormina.

Professor Puddu defined cor pulmonale as the cardiopathy used by a pulmonary hypertension that is not caused by cardiac sions. The study of this disease concerns the heart, the pul-onary circulation, and the respiratory function. With regard to e examination of the heart, observations of physical nature are nerally of little help; roentgenologic investigation may show e increasing enlargement of the right cavities, and electro-rdiographic examination may reveal the various pictures tributable to the two main forms of cor pulmonale: acute and ronic. Of much usefulness may be the determination of the locity of the blood flow. The investigations of the pulmonary rculation should include the determination of the systolic, astolic, and mean pressure in the right auricle, the right ven-icle, and in the pulmonary artery. The capillary pressure and e quantity of blood circulating in the lungs should also be termined. It is also necessary to study the respiratory func-on from the point of view of ventilation and of gaseous ex-ange. The various mechanisms that alter these functions con-itute the various forms of pulmonary insufficiency. The study the pulmonary circulation and of the respiratory function re-uires complex techniques, today greatly improved, that permit better cognizance of these functions in normal as well as in thological conditions.

Professor Puddu, in a short discussion of the anatomy and ysiology of the pulmonary circulation, pointed out that in e lung there is a functioning circulation and a reserve circu-tion, and also that in addition to the capillary alveolar system ere probably is an anastomotic arteriovenous system. From the iological point of view, cor pulmonale may be due to anatomic terations of the thoracic cavity, to diseases of the pulmonary renchyma, to diseases of the pulmonary vessels, and to other seases. The course can be classified in acute, subacute, and ronic. It is known that the syndrome of acute cor pulmonale ay be due to many other causes besides pulmonary embolism.

With regard to the general pathogenesis of this disease, it ould be emphasized that the main mechanism of the cardiac sion consists in the increased action of the right side of the art owing to the increased pulmonary resistance that causes evation of pressure in the arterial circulation. Another factor the increased action of the right side of the heart may be und in an increased pulsation, as has been observed in some lmonary diseases. Also, anoxemia may be a direct cause of rdiac lesions, and, in some cases of acute cor pulmonale, in ldition to the aforementioned factors, there may be also col-pse of the peripheral circulation, which may give rise to an chemic condition of the myocardium. Some coronary con-rictive reflexes originating in the lung may lead to an ischemic ndition of the myocardium. An example of acute cor pul-onale is Uhlenbruck's syndrome.

Subacute cor pulmonale may be due to metastatic lymph-gitis of the lung and also, in rare cases, to protracted throm-sis of the pulmonary arteries in anemic persons. Chronic cor lmonale arises from a pathological process of long duration, hich leads to a slow and progressive increase of the arterial essure in the pulmonary circulation. Among the many causes the chronic form are parasites, interstitial pulmonary sclerosis, ronic emphysema, and, in particular, primary arteritis, hyper-nsion of the pulmonary circulation, and the possible primary disease of the alveolar wall. In diagnosis of the chronic cor pulmonale differentiation must be made between symptoms of pulmonary insufficiency and symptoms of cardiac insufficiency; this is a difficult but always very important task. Then the type of lesion, cardiac as well as pulmonary, should be determined. Sometimes differentiation of this disease from some congenital cardiac lesions is difficult.

The hemodynamics of the chronic cor pulmonale was also discussed. Particularly interesting is the question of decompensation with increased cardiac output. In these instances, the mechanism of decompensation is characteristically shown by premature anoxemia and gives an unusual aspect to all the hemodynamic reactions. In treatment one should consider the particular form of decompensation with increased output that is present in many of these patients and that modifies greatly the usual therapeutic response to the common cardiokinetics. An attempt should also be made to control anoxia, one of the main factors in the disease.

The Heart in Pulmonary Tuberculosis.—Dr. Di Maria emphasized that the opinions of phthisiologists on the possibility of heart lesions arising from tuberculosis have never been unanimous. While, in fact, some authors affirm that the tuberculous disease cannot determine lesions or functional disturbances of the myocardial fiber, others insist that this tuberculous entity may be the cause of structural alteration and functional impairment of the heart. One may say that today the presence of tuberculous infection in the heart is infrequent. The same cannot be said with regard to the indirect influence of the tuberculous disease on the integrity and the functioning of the myocardial fiber by means of mechanical, physiopathological, and biologic factors. Examples of mechanical causes, that is, those that may alter the normal condition and the balance of the factors regulating the intrathoracic hemodynamics, are pronounced displacements of the mediastinal organs, pronounced blocking and destruction of the vascular bed of the pulmonary circulation, and the "hydraulic press" action of coughing, according to the concept of Morelli. Physiopathological causes are those that in various ways may bring about and maintain conditions of myocardial anoxia. Biologic causes are represented by the toxinfectious action of the tuberculous agent on the myocardial muscle fiber, on the endocardium, and on interstitial heart tissue.

Dr. Di Maria has made numerous and careful investigations of this problem from various points of view. On more than 3,000 patients with chronic pulmonary ulcerofibrous tuberculosis, electrocardiograms were obtained with standard derivations as well as with Wilson's precordial leads or with some particular derivations suggested by the author himself for the study of the right side of the heart. He has also made anatomicopathological and statistical investigations on all the autopsies performed at the Institute Forlanini in Rome in the last 10 years. He has made a study of the respiratory function according to the Knipping-Scoz method on about 2,000 persons. He determined the venous pressure in the upper extremities and the rhythm of circulation in patients with pneumothorax of one or both sides. He obtained symptomatic and physiopathological data with regard to the heart in patients who had undergone thoracoplasty. He made histopathological studies of the heart of experimental animals that died of experimental tuberculous infection or of continuous administration of tuberculous toxins. On the basis of the results of these numerous researches, Dr. Di Maria is inclined to consider tuberculosis as a morbid entity that may have a considerable harmful action on the heart by various pathogenic mechanisms. However, he believes that the changes in the heart during the course of a tuberculous disease are not the same as those seen during the course of other chronic diseases of the respiratory apparatus. Therefore, according to him, the term chronic cor pulmonale with regard to tuberculous disease should be replaced by the term cor tuberculare. Considering the possibility of the presence of a lesion of the heart, he suggests a systematic study of the functions of the heart and the respiratory system in persons who are to undergo surgical collapse treatment.

e items in these letters are contributed by regular correspondents in e various foreign countries.

BELGIUM

Gastroduodenal Perforations.—The Belgian Association of Surgery heard a report by Morelle, who, on the basis of his personal statistics (101 cases) and the experience of Herman Taylor, initiator of the aspiration method, concluded that gastroplication is not inferior to aspiration, provided that the delays of perforation (12 and 24 hours) are taken into consideration.

After this report Coryn presented statistics of gastrointestinal perforations treated at the Brugmann hospital. Preference was given to emergency gastrectomy (56 cases, with a mortality rate of 12%) rather than to simple gastroplication (30 cases, with a mortality rate of 36.6%). Dr. Coryn emphasized that the high mortality rate in the second group may be explained by the fact that gastroplication was reserved only for grave cases, in which gastrectomy did not seem to be justified. Samain routinely performed emergency gastrectomy in 121 cases of perforation, with a mortality rate of 3%. These excellent results are attributable to the use of dibucaine (nupercaine®) hydrochloride for spinal anesthesia, a method that, according to Samain, would definitely prevent shock. Aspiration should be considered only as a preparatory phase for gastrectomy. There are three indications for this intervention: (1) the pain, (2) the emotional strain endured by the patient during the time preceding the surgical intervention deferred for a long time, and (3) the economic factor, necessitating early resumption of activities by the patient.

Smets presents the statistics of 331 patients operated on at the Saint Pierre Hospital. He divides these statistics in two parallel and comparable series representing consecutive phases in the development of surgical concepts. The mortality rate thus has been reduced from 25% to 3%. This spectacular improvement is related entirely to the use of antibiotics and to the effective preoperative and postoperative care and not to the preference given in recent years to early gastrectomy. The analysis of late results also convinces one that gastroplication yields only moderately beneficial results and that those obtained with gastrectomy are by far superior, the incidence of secondary peptic perforations being almost negligible.

Legrand reports on 23 consecutive patients treated by aspiration combined with intraperitoneal injection of procaine penicillin without a single fatality. Aspiration is sometimes the only feasible method. Of 570 cases listed in the world literature there have been only 46 deaths, and, notably, in 23 cases surgical intervention was absolutely impossible. In summarizing the discussion, the conclusion may be drawn that there is not a single method that may be used exclusively for the treatment of perforation, but treatment varies with the individual case.

Enuresis.—Dellaert of Antwerp reported in the *Acta neurologiques et psychiatriques belges* studies of the etiology and of the psychiatric syndrome of enuresis. This "social disease" strikes 5% of the infant population and must be considered as an infantile form of neurosis. Contrary to incontinence, it can be defined as a psychomotor disturbance of micturition with physical integrity. The author discusses various associated organic symptoms that cannot be considered the real organic cause: spinabifida occulta, phimosis, adenoid vegetations, and cryptorchism, as well as various diatheses. In fact, four-fifths of persons with enuresis do not present externally any particular sign. Hereditary factors seem to intervene, being linked to irritability of the vesical walls or to an allergic component associated with a vagotonic state. The pathogenic role of deep sleep is doubted by the author. In regard to the mechanism of micturition, the author admits that cortical mechanisms of vesicourethral control may be present at birth, and this concept is based on the observation of behavior of the child at the time of the first micturition. He shows how the educators' carelessness and negligence lead to neurosis and psychogenic reaction, in which organic deficiencies direct the choice of the enuretic symptom, by which the most various conflicts can be exteriorized.

Fractures of the Calcaneus.—During a special session of the Belgian Orthopedic Association, a report was presented on studies made in treatment of fractures of the calcaneus and of their sequelae. This is a problem that has not yet been completely clarified. After discussing the anatomic and circulatory conditions of the region, Belenger called attention to the
high incidence of subastragalar talipes valgus and its thera
corollary: reduction and application of plaster cast in varus p
tion. The treatment must consist of an ambulatory plaster c
to make walking possible in cases of fracture without dis
tion, of reduction in cases of dislocation, or of extension f
lowed by arthrodesis in comminuted fractures. J. Gos
method consists essentially in (1) application of a Böhler's s
to the substragalar joint with traction according to Kirsch
method; (2) reduction by means of a pointed device of the t
of Steinman's pin introduced through the external aspect i
the focus of the fracture and lowered downward and backw
to lift up the thalamus; (3) a plaster cast to keep the poi
device in place for 30 days, then an ambulatory plaster cast
60 days. The speaker was reserved in regard to early arthrod
osteosynthesis, or the use of bone grafts, and in conclusion
stressed the importance of physiotherapeutic treatment and
absolute necessity of close collaboration of the surgeon
the physiotherapist.

Prof. Mandruzzato of Brescia also emphasized the diffic
of effective therapeutics. He studied a large number of inju
persons treated by extension and divided them in two gro
those with bad results (85%) and those with good results (15
He concluded that the final result depends more on the un
paired state of the articular surfaces than on the anatomic
toration. In cases of unimpaired articular surfaces he us
simple plaster covering a metallic splint, which pushes do
ward a transcalcaneous peg. In other instances, surgical expl
tion demonstrated that the problem is much more comp
After various tentatives, Mandruzzato, like many others,
sented to early arthrodesis. This spares the patient long
bility and much pain.

Low Back Pain.—At the Academy of Medicine, P. Glorieu
ported on some causes of lumbago in a paper entitled: "
of Static Origin in the Lumbar Region." He describes
types: 1. Neuralgia of the interspinous ligaments, inters
nearthrosis or Baastrup's disease, caused usually by violent
repeated contact of the spinous processes. It is frequently
ciated with greater density of the bone tissue of the upper
lower edges of the lumbar spinous processes. 2. The verte
of transition, sacralizations, and lumbarizations, which, a
speaker emphasizes, are not always painful when they are
and symmetrical, and give rise to scoliosis when they are
lateral. 3. Painful spondylolysis. The speaker stresses the
acteristic aspects of the roentgenologic pictures taken in va
exposures, as well as the abnormal aspects when roentgeno
examination is performed with the patient lying on his stom
and with the use of iodized oil (lipiodol®) as contrast med

Vitamin Therapy and Urinary Tuberculosis.—In an articl
the *Scalpel*, Stobbaerts reports the use of vitamin D in
therapy of renal tuberculosis. Massive and repeated vita
therapy, under strict control, acts with greatest efficacy
parenchymatous stages of the disease and in bilateral r
tuberculosis. In ulcerocaseous tuberculosis nephrectomy wil
move foci, which may later flare up. Nephrectomy shoul
delayed until the patient's resistance is increased. Vita
therapy will have a prolonged favorable effect on the co
of the sequelae of nephrectomy and will favor convalesce
Finally, in patients who for some reason cannot, or refuse
undergo surgical intervention, massive vitamin D therapy
always cause improvement, although this effect may be tem
rary.

Medical Days.—The 25th anniversary of the Medical Day
Brussels was celebrated this year. These meetings were first
ganized in 1920 by Dr. L. Mayer, Dr. R. Bernard, and Dr.
Beckers; they were discontinued during the war, and in 1
the annual sessions were resumed. This year they assumed
ticular importance. Prof. E. J. Bigwood, who presented the
augural address, reviewed the development of biochemis
emphasizing its increasing importance in the medical scien
He appealed to the public to support scientific research, so t
the University Laboratories can preserve their traditional r
He reminded the audience of the enlightened initiative of K
Albert, the initiator of the National Funds of Scientific
search, whose work must be continued and extended. Amo

lectures given, was that of Dr. E. Donzelot (Paris) on sur- l indications in mitral lesions, of Dr. D'Allaines (Paris) on gical treatment of mitral stenosis, of Dr. M. Segers (Brussels) recent progress in the diagnosis of mitral disease, and of Dr. Christophe (Liège), who presented a color film on ventricular llation.

Ir. G. Fanielle (Liège) presented the history of massive vita- D therapy, and pointed out the indications, inconveniences, the mechanism of action of such therapy. In addition to the ierous lectures, many groups held their meetings on this occa- , among them the Belgian General Association of Dentists, Belgian Association of Endocrinology, the Belgian Medical ociation of Physical Education and of Sports, the Belgian ociation of Scientific Studies on Tuberculosis and on Pneu- ogy, and the Medicosurgical Association of the National ociation of Belgian Railroads. The final meetings were held in ende, with a tour to the Palace of the Thermae and a lecture various aspects of utilization of radioactive isotopes.

igulants and Anticoagulants.—The annual Congress of the gian Association of Surgery met in extraordinary session at nt. Coagulants and anticoagulants were discussed. Van der den reviewed the indications and contraindications of various eral hemostatics, such as thrombin, fibrin foam, gelatin nge, and alginic acid products. Van Wien discussed anti- gulants. These substances were recently introduced for pre- tion and treatment of thrombosis. Heparin, bishydroxy- marin (dicumarol®) and its derivatives, and phenylindane- ne proved the most promising clinically. The author presented omplete pharmacologic study of these various products and cussed in detail the question of controlling their activity. then considered the method of administration and the results anticoagulant therapy in the various types of venous throm- is: postoperative thromboembolism, thrombosis of the retina, l mesenteric thrombosis.

Their usefulness in arterial thrombosis has proved to be isiderably less. On the other hand, in vascular surgery, use of heparin has permitted the safe performance of many icate interventions. The report ended with a discussion on administration of anticoagulants in certain infections, in irologic disturbances such as multiple sclerosis, for the pre- ition of peritoneal adhesions, in burns, and in the cicatrization wounds.

cephalitogenic Property of Vaccine.—Encephalitis occurring er vaccination against smallpox has recently been the sub- t of discussion. At the Central Laboratory of the Ministry of blic Health, Nelis and Lafontaine investigated the pos- ility of obtaining from an ordinary strain of vaccine a strain it would be regularly encephalitogenic. Their studies were o designed to determine whether, through the action of formal- iyde, the encephalitogenic strain could lose this characteristic ile maintaining its dermotropic properties. His results permit following conclusions: 1. An average vaccinal virus may quire constant encephalitogenic properties after a few re- ited passages to rabbits by intratesticular injection but with- t intracerebral injection. 2. The encephalitogenic tropism of virus may be observed, whether it is inoculated into the n, in the testicle, or in the brain. 3. This activation is accom- nied by classic changes in its dermotropic action. 4. This quired *encephalitogenic activity is lost through the action of* ak concentrations of formaldehyde (0.1:1,000) during 48 hours 20 C (68 F). 5. In the observed strain, the abnormal dermal inifestations presented by the activated virus disappear under peated action of formaldehyde.

incer of the Anus.—At the Belgian Society of Gastroenterol- y, Cogniaux, Simon, and Vigoni presented an important con- bution concerning treatment of epithelioma of the anus. The thors present a report of 37 cases, in which treatment con- ted mainly in irradiation by radon needles. The authors dis- iguish two stages and even perhaps a third. The first stage mprises tumors 3 cm. in diameter, which do not grow upward id do not involve the periphery of the anus. It is at this stage at best results are obtained: the lesion is locally sterilized, but e sequelae (rectitis, sclerosis, radionecrosis) may not be oided, nor can occasional recurrences. The second stage comprises tumors the circumference of which is not too great, but which grow upward or encircle the anus, as well as those tumors that already have metastasized. In some of these cases surgery is of no avail. Here, too, local sterilization may be obtained, but the undesirable effects are serious (rectitis, sclerosis, incontinence, radionecrosis). The authors feel that the technique should not be abandoned because of these sequelae, but should be improved.

DENMARK

Tuberculosis in Greenland.—During the last 30 years several reports on tuberculosis in Greenland have been published by Danish physicians more or less temporarily stationed in this dependency of Denmark. These reports, which are fair samples of diagnostic standards from time to time in most centers of medical science, have shown that tuberculosis in Greenland has behaved in much the same way as it has elsewhere in Europe. Here, as elsewhere, there are the various forms: primary infiltrations, primary complexes, exudative processes, and fibroses. The earlier reports, covering the years 1923-1935, depended largely on the older clinical tests with stethoscope and sputum examinations. During this period the tuberculosis rate was high, ranging from 12 to 20%. Among the more recent reports, based on modern tests, including radiologic examinations, is one by Dr. Mogens Fog-Poulsen who, in a community of 1,390 persons in the north of Greenland, found tuberculosis in 7%. Comparing stethoscopic with radiologic tests, he has come to the conclusion that the former are of doubtful value in the discovery of tuberculosis. He employs the Moro tuberculin plaster test, and gives BCG to the negative reactors. Though his tuberculosis rate may seem to compare favorably with the tuberculosis rates of his predecessors, he insists that tuberculosis continues to be one of Greenland's greatest scourges. This is not surprising, considering the conditions under which the Greenlander lives. Subsisting on seal-hunting, whaling, fishing, catching sea birds and collecting their eggs, he still lives in earth and stone buildings, at least as far as the outlying districts are concerned. These hovels may be warm enough but are difficult to keep clean. They are being replaced by wooden houses in the larger communities, where the old-fashioned furs and skins are being replaced by imported textiles. The fatalistic mentality of the good-natured Greenlander does little to encourage him to take active measures against tuberculosis.

Cerebral Tumor Diagnostic Mistakes.—At the psychiatric department of the Bispebjerg Hospital, Dr. Frederik F. Wagner has undertaken an analytical study of the 49 patients with cerebral tumor entering this hospital in the 12-year period, 1939-1950, with mistaken diagnoses at the time of admission. During the same period there was a total of 31,348 admissions to this hospital, so that cerebral tumors constituted only 0.15% of the admissions. This is a remarkably low rate, considering that earlier investigations have shown such cases to constitute between 0.5 and 2% of all hospital admissions.

These 49 patients were sent to the hospital with a great variety of diagnoses, none of which proved correct. In as many as 16 cases the original diagnosis was epilepsy. The correct diagnosis in these cases depended to a considerable extent on the frequent employment of air encephalography. The original and mistaken diagnosis was some form of psychosis in 19 cases, in 14 of which a depressive psychosis was diagnosed. It was noteworthy that among the total of 49 cases of cerebral tumor there were only 4 in which there was not some kind of psychic disturbance. In 37 of the 49 cases the correct diagnosis depended on a clinical examination in the hospital, and in 26 cases the diagnosis was verified at an operation. The diagnosis depended on a postmortem in the remaining patients. The correct diagnosis had already been made in some cases before the postmortem.

Dr. Wagner insists that the diagnosis of cerebral tumor may be difficult even at an advanced stage of the disease, and in many of his cases the tumor had already attained a considerable size. He has found little aid to correct diagnosis in general psychic symptoms, but he points out that when dementia sets in comparatively early in life, it is well to suspect an organic lesion.

CORRESPONDENCE

ANIMAL EXPERIMENTS

To the Editor:—A letter from Dr. J. R. Baker, Prof. Sir Frederic Bartlett, Prof. A. C. Hardy, Dr. E. Hindle, Major C. W. Hume, and Dr. W. R. Wooldridge was published in the *Lancet* on Aug. 6, 1949 (page 259), on the ethics of experiments on animals. The signatories wished to condemn as shocking to a normal human conscience experiments (referred to below) which were carried out in Canada and the United States in the investigation of shock.

The thesis of their argument can be briefly summarized thus: (1) Experiments of this kind are too cruel to be justified. (2) There should be a limit to the doctrine that the end justifies the means. (3) In this country the Cruelty to Animals Act (1876) would operate and prohibit experiments of like severity to those carried out abroad on traumatic shock.

References to the above experiments, not given in the letter, have now been obtained from Major Hume, who is director of the Universities Federation for Animal Welfare (U. F. A..W.) and who has stated that he was largely responsible for the publication of the letter.

In essence the experiments condemned in the letter were as follows.

The work of Gregersen and Root was essentially a study on traumatic shock and was carried out at the request of the Subcommittee on Shock of the Committee on Medical Research, Office of Research and Development, U. S. A., the work being done in the autumn and winter of 1941.

The object of the experiments was to determine, on the physical signs, whether or not the condition produced experimentally was a true replica of the syndrome of shock as observed in man. A second objective was to determine the degree of blood volume reduction in traumatic shock, and its role in the development of the shock syndrome. At the time these experiments were performed this essential knowledge had yet to be gained. Previous evidence included much work which appeared to show that a reduction in blood volume was the most important single factor traumatic shock. The evidence was not accepted as completely valid for two reasons. In the first place, there was controversy regarding the adequacy of methods for measuring blood volume. Secondly, the obvious disturbance in the blood flow in traumatic shock and the widely accepted view that excessive capillary leakage occurred in shock were considered adequate grounds for suspecting that the blood volume could not be determined in shock by any of the dilution methods.

To decide these fundamental questions Gregersen and Root experimented on dogs. The dogs were anesthetized, and traumatic shock was induced by hammering the limbs. The animals were then allowed to come out of the anesthetic in a state of shock.

The results reported in a series of papers by Gregersen and his colleagues showed: (1) The clinical signs displayed by the dogs were identical with those which in man constitute the syndrome of secondary shock. (2) The validity of the dye-dilution methods for the measurement of plasma volume is not fundamentally altered when the methods are applied to animals suffering from traumatic shock. (3) The blood volume is significantly and greatly reduced in traumatic shock, and the degree of reduction is related to the severity of the shock.

The experiments of Noble and Collip were devised to reproduce a required degree of shock. When research is planned to study the influence of some procedure or drug in the prevention or treatment of shock, great difficulty has been experienced in producing a consistent degree of shock in different experimental animals. It is therefore very hard to draw firm conclusions as to the merit or otherwise of the proposed method of treatment.

Noble and Collip designed a drum in which anesthetized rats were rotated and during each rotation fell from the top of the drum to the bottom, a distance of some 18 inches. The effects were very variable. When unanesthetized rats were used, the mortality rate with a given number of falls was less than anesthetized animals. The mortality rate was much more c sistent, increasing with the number of falls. It has been fo by many workers that anesthesia profoundly affects the resp to injury. In order to achieve the purpose of the experim namely, to produce a similar degree of trauma with sim effects on different groups of rats, Noble and Collip foun was necessary to use unanesthetized animals.

It should be emphasized that each single fall produced extremely mild injury; no fractures or hemorrhages into tissues were observed in these animals. In summary, Noble a Collip succeeded in producing a method by which relatively c stant mortality rates could be produced in successive batc of animals. This enabled them to study, with some confid in the validity of their results, the effects of various fracti of the adrenal cortex. No dramatic effects were, in fact, o served. However, there can be no doubt that their experim were of considerable value taken in conjunction with the r mainder of the great mass of experimental work on shock

One of the great medical achievements in World War II w the dramatic improvement in the treatment of battle and raid casualties. The fundamental principle of the treatment wound shock was "early and adequate blood transfusion." Th seems simple and obvious today. It was not so before the w It required widespread and concentrated experimental work a clinical observations by a large number of experienced inves gators in many different parts of the world to establish this pri ciple. The work of Gregersen and his collaborators, and Noble and Collip, formed an important part of these investi tions, which undoubtedly saved thousands of lives.

One serious consequence of the letter is that, as could h been anticipated, it is being used as antivivisectionist p ganda abroad and is embarrassing our Canadian and Ameri scientific colleagues. The antivivisectionist societies in their pr aganda *campaign actually quote the references* we have tained from Major Hume, and it is of interest to note th although these references were not given in the original let to the *Lancet*, the signatories to the letter stated they "will given to responsible enquirers on request." We are unable regard as responsible persons or societies whose avowed aim the prohibition of all animal experiments, a measure wh would be so profoundly against the public interest. The wi holding of references in the original letters seems, however, have been pointless, if we are right in assuming that they w supplied on request to antivivisectionists, who could only w to use them for antisocial purposes.

This ill-conceived letter concluded with an appeal to scient to condemn as shocking such experiments, but in the subsequ correspondence in the *Lancet* no scientist of repute did in f take part, let alone respond to this appeal. But the unfort consequence of this is that many of our Canadian and Am can colleagues regard the views expressed in the original let as representative of those of the generality of scientists o here. It is to disperse such a mistaken impression that this lett now appears. Of the signatories of the original letter, not o had ever had occasion to work on the difficult problem of sho although three of them held, or had at some time held a Ho Office license. We believe that scientists whose experience h brought them closer to this problem would have declined, a possibly did decline, to sign such a letter. All the signatori had this in common: they were members of U. F. A. W. Wou not this admirable organization spend its efforts to better eff in combating cruelty where ignorance and indifference prop gate it, instead of joining in the antivivisectionist witch hun

OMPARATIVE ANATOMY

the Editor:—Dr. Louis J. Karnosh has given us a strong cle in his "Neurology and Human Emotions," in THE JOUR- OF THE AMERICAN MEDICAL ASSOCIATION (147:289 [Sept. 22] 1). In the same issue of THE JOURNAL, among the book re- vs, is mention of William King Gregory's two-volume work, olution Emerging, A Survey of Changing Patterns from neval Life to Man." I believe that the work of Dr. Karnosh of Dr. Gregory, the first in human anatomy, the second in iparative anatomy, fit together. They mesh. It may not be farfetched to mention that in the Oct. 6, 1951, issue of JOURNAL (page 568) the excerpt entitled "Medical Educa- i" starts with "The most important element in medical edu- on is theory. . . ." It seems that here we have three ks in a jig-saw puzzle, theory being the middle block binding ether the works of Dr. Karnosh and Dr. Gregory.

efore 1914, Dr. Gregory had opened his laboratory of com- ative anatomy to graduate students in the department of logy in Columbia University. There were possibly six or eight us. Once a week, leaving the university campus we spent an ire day in the American Museum of Natural History under Gregory. Some members of the class already held the degree loctor of philosophy. I happened to be the one to have that loctor of medicine.

herefore, it is my belief that cooperation between workers h as Dr. Gregory and anthropologists such as Dr. Ernest ert Hooton of Harvard, and other men whom they might ignate, can contribute a key to a certain number of problems ing Dr. Karnosh and his collaborators.

he difficulties are self-evident—almost overwhelming. It will e much work on the part of wise locksmiths. But compara- anatomy holds the key which fits the tumblers in some of Karnosh's locks.

t is to be expected that Dr. Karnosh's fine paper will stimu- progress. It will mark the year 1951 as initiating an advance our knowledge of the anatomy, physiology, and pathology the emotions.

CK OF STERILITY OF EYE MEDICAMENTS

the Editor:—There is no specific governmental regulation icerning the sterility of eye medicaments. Neither of the cial compendia regulating the practice of pharmacy mentions subject. As a result, even large pharmaceutical companies, iplying widely used and valuable drugs, dispensed on prescrip- n in their original containers, are not required to adhere to official standard procedure to insure sterility. If an indi- ual retail pharmacist prepares a contaminated solution, since drug is generally used by the patient immediately after prepa- ion, the concentration of organisms is low and may not cause ection. Even if an infection does occur, the incident, while fortunate, is limited to the one patient and generally is traced ickly to its source. However, when a large manufacturer re- ses an infected batch of a compound, which may number ousands of units, the situation may become disastrous before shipment is recalled. During the long time interval between nufacture of the drug and the final harrowing realization of ophthalmologist that the eye medicament he prescribed is cause of a serious secondary eye infection in his patient, iny other contaminated bottles, which by that time may be ided with organisms, have been prescribed and dispensed with nfidence.

Within the past three years, on at least three occasions, widely d eye drops were withdrawn from the market because of ntamination. In two of these instances sulfonamide drugs used treat infections were found to be grossly infected with patho- nic organisms. Recently, one brand of ophthalmic cortisone s been found to contain Pseudomonas aeruginosa (Bacillus ocyaneus). The corneal ulcer resulting from pyocyaneus in- tion is perhaps the most serious one encountered in practice; en if the eye is saved serious loss of vision may occur.

There are probably other instances of contamination of com- rcially prepared eye medicaments that are never publicized. The importance of preparing sterile ophthalmic solutions, using the same rigid technique as for parenteral solutions, has been recognized in many European countries. Both the British Codex and the British Pharmacopeia specifically require that eye solutions be made and dispensed under sterile precautions. This applies to local pharmacists as well as large manufacturers of pharmaceuticals.

It would seem only reasonable, therefore, to expect in the United States specific regulations to insure the sterility of commercially prepared ophthalmic medicaments. The companies making them have the facilities to do so.

INSECTICIDE STORAGE IN ADIPOSE TISSUE

To the Editor:—In the editorial "Insecticide Storage in Adipose Tissue" published in THE JOURNAL (145:735 [March 10] 1951), there are two points to which I would like to call your attention.

The statement is made: "Dichlorodiphenyldichloroethane, another analog, is stored in body fat to an even greater extent than dichlorodiphenyltrichloroethane,[9] but its chronic effect is only half that of dichlorodiphenyltrichloroethane."

In supporting reference 9 of the editorial, it is not stated that dichlorodiphenyldichloroethane is stored to a greater extent than dichlorodiphenyltrichloroethane, the only statement bearing on dichlorodiphenyldichloroethane storage reading: "DDD also accumulated in fatty tissues." On the basis of our own studies (*Proc. Soc. Exper. Biol. & Med.* 72:357, 1949) and those of Laug, Nelson, Fitzhugh, and Kunze (*J. Pharmacol. & Exper. Therap.* 98:268, 1950), both of these compounds are stored in fat to a similar degree, with the difference that dichlorodiphenyldichloroethane (DDD) is more rapidly eliminated from the fat than dichlorodiphenyltrichloroethane (DDT) on deletion of these materials from the experimental diet (unpublished data).

In our experience with the relative chronic toxicity of the two insecticides, we have found (*Indust. Med.* 17:477, 1948) that in feeding experiments on rats DDD is about one-third as toxic as DDT.

PNEUMOPERITONEUM

TO THE EDITOR:—In the Oct. 6, 1951, issue of THE JOURNAL (page 568), Hollander reports three cases of air embolism as a complication of pneumoperitoneum. In two patients the injection of air was made into the right upper quadrant of the abdomen. In the other case it is stated only that the needle was introduced into "the peritoneal cavity."

This is to report two additional instances of proved air embolism due to pneumoperitoneum occurring in the course of treatment for pulmonary tuberculosis. In both patients the injection was made into the right upper quadrant. There was one fatality. Autopsy revealed air in the right auricle and right ventricle with scratch and puncture marks on the inferior surface of the liver. The other patient recovered completely from a sudden episode of hemiplegia and collapse, which occurred during the pneumoperitoneum injection. Air was aspirated from the right ventricle during the period of collapse.

It is felt that the right upper quadrant of the abdomen is the one area where pneumoperitoneum injection is most hazardous. Presumably, this is due to the possibility of introducing air directly into the liver. Since changing to an injection site 2 cm. to the left and 2 cm. inferior to the umbilicus, there have been no complications in several thousand pneumoperitoneum treatments at this institution.

BUREAU OF LEGAL MEDICINE AND LEGISLATION

MEDICOLEGAL ABSTRACTS

Evidence: Misleading Statements in Dentifrice Advertising.—This was a petition to review an order of the Federal Trade Commission. The order forbade, as misleading and likely to deceive the general public, certain advertising by the petitioner in regard to his toothpaste. The case was heard in the United States Court of Appeals, fourth circuit.

The petitioner represented in advertisements (1) that, according to a national survey conducted in 1940 among thousands of dentists, twice as many dentists personally used Ipana toothpaste as any other dentifrice and (2) that more dentists recommend Ipana for their patients' daily use than the next two dentifrices combined. These advertisements, according to the evidence, were based upon the answers to a questionnaire sent by the petitioner in 1940 "to each of 10,000 dentists out of 66,000 in the United States picked at random from the subscribers to two dental magazines." The questionnaires asked: (1) What dentifrice do you personally use most often? (2) What dentifrice do you most often recommend to your patients? In reply 1,983 questionnaires were received which contained 2,467 replies to the first and 2,364 replies to the second question. The replies exceeded the questionnaires in number because some dentists named more than one product in their answers. Of the 2,467 replies to the first question, 621 dentists replied that they used Ipana most often, whereas the four nearest competing products were preferred by 258, 189, 144 and 128 dentists respectively. In answer to the second question, 461 dentists indicated that they most often recommended Ipana to their patients while the four nearest competing products were preferred by 195, 125, 106 and 94 dentists respectively. Of the 461 dentists who recommended Ipana to their patients, 413 used it themselves and 48 did not use it. Other surveys conducted in 1941 and 1944 revealed substantially similar situations. Based upon the results of the survey, the petitioner published advertisements from which the casual reader would reasonably infer that careful inquiry amongst members of the dentist profession had disclosed that a large majority of the dentists in this country not only used Ipana for themselves but recommended it to their patients.

We are of the opinion, said the court, that the sweeping statements made in the petitioner's advertisements were not justified by the answers to the questionnaire and that in consequence the advertisements were misleading and likely to deceive the general public. Certainly the average reader would not infer that the "positive proof" in the hands of the petitioner disclosed that personal preference of only 621 dentists and the customary recommendation on toothpaste to patients by only 461 dentists out of the 66,000 dentists in the United States, or that less than 20% of those who had been questioned had taken the trouble to reply, so that the use and practice of the remaining 80% were unknown. It may well be, the court continued, that an accurate estimate of public opinion or practice can be obtained by a sampling process or survey, but the record is devoid of information on this subject and in the absence of the proof of the scientific principles, if any, which underlie the practice, we must rely upon the impression which the advertisements would be likely to make upon the mind of a man of ordinary intelligence. This is not to express the opinion, concluded the court, that all advertisements based upon surveys must be barred, but merely that the information in the possession of the manufacturer in this case was insufficient to support its advertisements.

The Commission's order to which the petitioner takes exception also contained findings in respect to advertisements which represented to the public that the modern American diet consists of such soft, well-cooked foods that the gums do not get the exercise and stimulation which they need, and that massage with Ipana will provide such exercise and stimulation, and will make the gums firm and healthy, guard against "Pink Tooth Brush," a bleeding of the gums sometimes due to disease, and prevent gum trouble generally. The Commission's order was based upon ings that the preponderant weight of qualified dental established the following facts: It is immaterial to the hea the gums whether the diet of a person is *soft or coarse,* and modern American diet provides sufficient *gum stimulation.* T term "massage," as used by dentists, means a careful dow stroking or squeezing pressure applied to a quarter inch of gum margin and teeth. The term "massage," as used in the ma facturer's advertisements, means to the general public a hori*tal, vertical or rotary scrubbing* of the teeth and the gums the brush, or a similar rubbing with the finger. Such uninstru *massage, either with or without* Ipana or any other toothpa *does not stimulate* circulation in the gums, impart firm *thereto,* or *prevent* gum trouble in general or pink tooth brus particular. Even carefully instructed and properly perform *massage is not needed in* a mouth free from disease, and a l man is unable to ascertain whether or not he is in need of m *sage. Ipana* toothpaste is a cleansing agent *only,* without th peutic value, and possesses prophylactic value only insofar a cleanses.

The petitioner contends that these findings were not suppo by substantial *evidence insofar* as they state that the use of Ip in connection with massage has no beneficial effect. The t *mony* in support of the findings was given by four expert den who were *distinguished in* their profession and had publis numerous articles in leading dental and medical journals. Tw them had published textbooks on dentistry. In opposition petitioner *produced one witness* who had been educated in m cine, *had been a medical* director in industry and in the a and was employed by the petitioner at the time of the trial. *testimony differed in material points* from that of the Com sion's experts. In our opinion, said the court, the Commission justified in giving preference to the *testimony* of the experts supported the allegations of the complaint and who, so far a *evidence shows,* were the persons best *qualified in* the fie form a trustworthy judgment upon the matters under inve tion. *Opinion evidence based on the general medical and* pha cological knowledge of qualified experts has often been he constitute substantial evidence, even if the experts have h personal experience with the product, and this has been even where witnesses who had personally observed the effe the product testified to the contrary. Accordingly the ord the Federal Trade Commission forbidding the use of the a tisements in question was affirmed.—*Bristol-Myers Co.* v. *eral Trade Commission,* 185 F. (2d) 58 (1950).

MEDICAL MOTION PICTURE

NEW FILM ADDED TO A. M. A. LIBRARY

How to Catch a Cold: 16 mm., color, sound, showing time 10 mi Produced in 1951 by Walt Disney Productions, Hollywood, for national Cellucotton Products Co. Procurable on loan (service char from Committee on Medical Motion Pictures, American *Medical A ation, 535 North Dearborn St., Chicago 10.*

The theme of this animated motion picture cartoon is it takes common sense to fight the common cold. Two humo creations of Walt Disney Studios, Common Man and Com Sense, combine to illustrate the scientific do's and don't's of prevention. They show how to catch a cold, how colds are sp how a day or so in bed can help protect a family, office, sc or an entire community and that a so-called "simple" cold actually be the first symptom of a more serious illness. illustration and discussion of the contagiousness of colds is *cially well done.* The entire presentation is done well en so that it could be used alone. However, it will provid excellent basis for further discussion by a *physician or he* educator on *the theme of cold prevention.*

The appeal of this film is universal. It is simple *enoug* be used in the elementary *grades* and yet will hold the atten of an audience of adults. The photography, animation, narration are excellent.

Coal Workers' Pneumoconiosis: Pathological and Etiological Considerations. A. G. Heppleston.—p. 270.

Etiological Factors in Bronchiogenic Carcinoma.—Results are reported of a survey of 857 patients, 803 men and 54 women, with proved bronchiogenic carcinoma. Of the men, 760 had epidermoid, undifferentiated, or unclassified bronchiogenic carcinoma and 43 had adenocarcinoma. Of the women, 32 had epidermoid or undifferentiated carcinoma and 22 had adenocarcinoma. One of the several factors that may cause primary carcinoma of the lungs is intrinsic, since not every person exposed to carcinogenic substances contracts cancer of the lungs. The nature of this intrinsic factor remains unknown for the present. Data collected through personal interviews of the authors' patients suggest that exogenous factors seem to be of equal importance in the development of lung cancer. Some occupations, which are associated oftener than expected with the lung cancer group, seem to play a part in this regard, though decisive statistical evidence is lacking. Workers in such occupations include metal workers and painters, and workers exposed to excessive fumes of oils, gasoline varnish, and wood dust. City dusts and fumes cannot account for the increased incidence of lung cancer. The authors believe that tobacco smoking is the most important factor to explain the universal and predominantly male increase in lung cancer incidence. Of the 760 men with epidermoid, undifferentiated, or unclassified bronchiogenic carcinoma, 9.7% were moderately heavy smokers and 86.2% were heavy, excessive, or chain smokers, while only 1.4% were nonsmokers and 2.6% were light smokers. The greater the amount of tobacco smoked, the greater seems the risk of primary carcinoma of the lung. The data presented in this survey as well as in other recent large-scale investigations should lead investigators to concentrate their efforts in an attempt to identify and possibly isolate carcinogenic agents in tobacco smoke and in certain industrial subtances, with the hope that by their removal, or at least reduction, the incidence of primary cancer of the lungs may be decreased.

Beryllium Excretion in Humans.—The amounts of beryllium excreted in the urine by 20 patients with chronic pulmonary granulomatosis, by 35 persons not, so far as known, exposed to beryllium, and by 15 healthy workers in the beryllium industry were determined in 24 hour collections. Beryllium was not detected in the urine of any of the persons who had not had occupational exposure to beryllium. Of the 20 patients with chronic pulmonary granulomatosis, only 12 excreted detectable amounts of beryllium. Their daily excretion was found to be nearly constant during the experimental period. Beryllium was detected in the urine up to 10 years after cessation of exposure. In the urine of the healthy beryllium workers the amount of beryllium was comparable to that observed in the urine of patients with pulmonary granulomatosis who had worked in similar industries. The determination of beryllium in the urine, therefore, is of little value for the diagnosis of chronic pulmonary disease, because the excretion of beryllium indicates only past exposure. The excretion of beryllium appears to depend on the solubility of the inhaled material, since the highest excretions were observed in persons exposed to soluble beryllium.

Effect of Aureomycin on the Liver.—During the past 30 months the authors of this report treated 61 adults and 42 children with aureomycin intravenously. Of these, 14 also received aureomycin orally. In the latter group, after therapy, seven displayed signs of liver dysfunction and liver enlargement. Four had clinical jaundice, and hyperbilirubinemia was present in an additional patient. Pathological changes were found in the liver of five patients who died and on biopsy in a sixth patient. Two of the subjects who were given aureomycin intravenously were studied by means of serial liver-function tests, which showed diminution of liver function. The pathological changes in the liver appeared to be reversible when the condition was recognized early and aureomycin therapy was discontinued. Intravenous doses of aureomycin totaling less than 2 gm. a day in adults were not accompanied by evidence of liver dysfunction or injury, nor have these conditions been observed in more than 1,300 patients to whom aureomycin was given orally. The doses of aureomycin that caused these changes in the liver are now considered to be excessive. Aureomycin should not be given intravenously in large doses. It is suggested that, when aureomycin is administered orally in addition, no more than 1 gm. of aureomycin a day should be given by the intravenous route. When adjuvant oral therapy is not employed, 2 gm. of aureomycin a day given intravenously would seem to be the maximum dose. For children a maximum intravenous dose of 40 mg. per kilogram of body weight is recommended.

The Association library lends periodicals to members of the Association and to individual subscribers in Continental United States and Canada for a period of five days. Three journals may be borrowed at a time. Periodicals are available from 1940 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied with stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

An asterisk (*) before a title indicates that the article is abstracted.

Corticotropin and Cortisone in Blood Disorders.—Corticotropin (ACTH) or cortisone was administered to 40 patients with a variety of disorders affecting the hemopoietic system. Improvement in the clinical condition, as well as in the hematological picture, was noted in 5 of 11 patients with acute leukemia, in 3 of 4 patients with acquired hemolytic anemia, in 2 of 4 patients with disseminated lupus erythematosus, in all 3 patients with rheumatoid arthritis, and in 1 patient with idiopathic thrombopenic purpura. In addition, one patient each with multiple myeloma, terminal lymphosarcoma, chronic lymphocytic leukemia, and reticulum-cell sarcoma involving the bone marrow showed diminution in the number of abnormal cells in the marrow and regeneration of erythroid cells, although there was no clinical improvement. One patient, who had myelophthisic anemia, showed a decided increase in the nucleated red blood cells in the peripheral blood. One patient, with advanced Hodgkin's disease, had symptomatic improvement and reduction in fever but no hematological change. Slight reticulocytosis with no other effects was noted in two patients with pernicious anemia in relapse, and there was a decrease of purpura in two patients with aplastic anemia. No effects, other than adrenal-cortical hyperfunction, were noted in patients with chronic lymphatic leukemia, periarteritis nodosa, myelofibrosis, portal cirrhosis, chronic idiopathic neutropenia, and anemia associated with chronic pyelonephritis. The mode of action of these hormones may be related to the effects of adrenal-cortical hormones in producing lymphocytolysis, increased hemopoiesis, and alterations in immune reactions. These hormones may be of much value in patients with acquired hemolytic anemia and idiopathic thrombopenic purpura.

Five Years' Experience with Vagotomy.—In February, 1948, Miller and associates reported on a series of 101 patients who had been subjected to vagotomy. Three years later, the authors again made a follow-up study on this same group of patients and on 13 additional patients who had been subjected to vagotomy since then. Of the total of 114 patients, 14 were lost from observation, in the rest the results of vagotomy were investigated. The authors feel that the evaluation of any surgical procedure is not easy, because some of the favorable or unfavorable complications may be attributable to procedures done at the same time, such as gastroenterostomy in conjunction with vagotomy. The wide variety of minor symptoms that temporarily follow resections of the vagus nerves may at times be due to other lesions in the alimentary or biliary tracts. While there is ample proof in this series that vagotomy is sufficient in itself to provide a permanently good result, it is believed that the combination of vagotomy with gastroenterostomy has a definite place in selected cases. Vagotomy is by no means to be considered a substitute for gastric resection, but it should be considered as an alternate method of treatment, carrying with it a lower mortality and offering comparable results. Vagotomy is not considered advisable in patients with chronic gastric ulcer unless the patient is in too poor condition for resection and the lesion is lying high in the fundus or cardia and has been proved to be benign by biopsy. Vagotomy is indicated in treatment of stoma ulcers that have followed either gastroenterostomy or gastric resection in which obstruction is not a factor. It is to be especially recommended in instances of extreme ulcerative change in the region of the first part of the duodenum, in which a closure of the duodenum would be unusually difficult or hazardous and, therefore, resection considered too great a risk.

Surgical Treatment in Coarctation of Aorta.—This report reviews observations on 70 patients in whom Clagett performed an operation for coarctation of the aorta. The patients ranged in age from 7 to 50 years. The ages between 15 and 20 years are regarded by the author as the optimal ages for this operation. Unlike patients with some other types of congenital heart disease, persons born with coarctation of the aorta appear for the most part to be normal and healthy. Of the patients reported here, 42 were entirely or largely asymptomatic. Among those presenting symptoms, easy fatigability and dyspnea on exertion were commonest. Headache, aching or tiredness in the calves, and palpitation were the next commonest symptoms followed in close order by cold feet, precordial distress, dizziness, tachycardia, and blurred vision. Coarctation of the aorta should be thought of in young persons with hypertension. Angiocardiography is of slight value in the diagnosis and is unnecessary. Patients with coarctation of the aorta should not be denied the benefits of surgical treatment because of advanced age, my cardial conduction defects, previous cerebrovascular acciden or previous congestive failure. Resection of the strictured se ment of aorta with end-to-end anastomosis is the treatment choice. Of the 70 patients on whom surgical exploration f coarctation of the aorta was performed, 8 were found to ha inoperable lesions at the time of exploration, an inoperabil rate of 11.4%. This rate compares favorably with that of Gr (9.2%). There were five surgical deaths among the 70 patie (7.1%), but in the last 55 cases there were none.

Commissurotomy in Mitral Stenosis.—After mentioning t different techniques that have been employed for comm surotomy, Lam says that in the 19 patients operated on at t Henry Ford Hospital in Detroit, Bailey's method was used. T technique is described. The patients, ranging in age from 20 53, all had disabling symptoms of mitral heart disease, inclu ing shortness of breath, orthopnea, and inability to work. Se enteen had had attacks of pulmonary edema, and all exce one of these had had hemoptysis. Eight had auricular fibrillati at the time of operation. All had the typical diastolic rumble the apex, and nine had a systolic murmur at the apex. Fluc oscopic examination in most instances showed a picture typic of mitral stenosis, with enlargement of the pulmonary con left auricle, and right ventricle. Three of the deaths occurr among the five patients with evidence of hypertrophy of the le ventricle. In many of the patients the pulmonary artery pre sure was determined by cardiac catheterization. The mean pre sures varied from 54 to 124 cm. of water. There were fi deaths, and two of the surviving patients had unsatisfactory r sults. A review of the circumstances suggests that technical erro or poor selection of the candidates for commissurotomy we largely responsible for the unsatisfactory results. It is felt th the patient with terminal failure and the patient with hypert sion and mitral regurgitation should not have been operated o and that the patient with pericarditis should have been su jected to decortication. The authors feel that with better selectio of cases commissurotomy by the auricular approach should b accompanied by a low mortality rate and a high percentage c improvement in persons disabled by mitral stenosis.

undus Changes in Young Diabetics.—Post and Stickle present e results of studies made on 59 young diabetics, in whom abetes was diagnosed before the age of 15. It was found that e control of the diabetes as well as the duration of the disease an important factor in the development of retinopathy, kidney mage, and poor general physical condition. The patient who as able to maintain good control showed less pathological ogress than the one with poor control. This should serve as a imulus to the diabetic patient and the physician who is caring r him to attempt to keep blood chemistry normal and to treat oth minor and major complications early and thoroughly. egenerative changes are commonest in the vascular system of e retina. Capillary aneurysms and small round hemorrhages, sually found in the area between the superior and inferior mporal vessels, were the first changes seen. The very early sions were visible only on careful examination.

elaxation Methods in Navy Air Schools.—In 1943 reports from ight instructors at naval training stations indicated that many adets seemed fatigued, restless, sleepless, and apprehensive. uestionnaires filled out by 3,181 cadets at five preflight schools ndicated nervous complaints in most of the cadets. States of xcessive tension while learning to fly came to be recognized s a menace, and reports from the combat zones indicated that igh tension seemed partly responsible for loss of pilots and lanes. The relations of restlessness, insomnia, fatigue, appre-ension, and fear to states of neuromuscular tension had been vestigated by Jacobson, who had shown that these symptoms ay be diminished by methods of progressive relaxation, which re adaptable for group teaching. When a training program for e relief of nervous symptoms and fatigue was introduced, five fficers were given a course of instruction in progressive relaxa-on by Jacobson. These officers subsequently instructed other fficers, and those in turn instructed the cadets in classes num-ering up to 300. The course in relaxation for cadets was of 10 eeks' duration, consisting of three periods per week of one alf hour each. This was a greatly abbreviated course, and, since e cadets generally did not practice with daily regularity as Jacobson prescribed, the results obtained must be regarded as having been obtained under a very limited application of the method. Tests at the preflight school in Iowa City on 983 cadets who had received relaxation training indicated approximately 19% reduction of strains, sprains, fractures, and other minor injuries in the test group as compared with a control group. Tests on these same groups revealed a 38% reduction of days lost from injuries. In three preflight schools data were secured concerning the rest in bed of 140 cadets who had received relaxation training as compared with 190 cadets without such training. There was a marked decrease in restlessness and there was less talking or mumbling and probably less dreaming. The cadets who had received relaxation training went to sleep more quickly and had less insomnia.

Periarteritis Nodosa Following Thiouracil Therapy.—The occurrence of a diffuse sensitivity reaction to medication, most closely resembling periarteritis nodosa with associated Raynaud's phenomenon, is reported in a woman aged 37 with thyrotoxicosis, who had been given two courses of iodine, 0.3 gm. of thiouracil daily for nine weeks, and, after an interval of several months, again iodine and thiouracil for three weeks. Because of low-grade fever, leucocytosis, myalgia, and arthralgia the medication was stopped. Deep cyanosis of parts of all fingers and both palms was present. Both fifth fingers were waxy-white. The feet had patchy cyanosis similar to the hands. There was a small, tender, inflamed nodule on the right patella and a similar nodule directly on the pulsating left dorsalis pedis artery. The blood pressure rose to sustained levels of 170 to 208 mm. of mercury systolic and 118 to 128 mm. of mercury diastolic. This hypertension, as well as other observations in this patient, such as cachexia, fever, weakness, gastrointestinal disturbance, neuritis, myositis, arthritis, tachycardia, renal involvement, anemia, and leucocytosis, were all typical features of periarteritis nodosa. Six months later, her pathological condition had subsided and seemed quiescent, but hypertension persisted and was finally controlled by bilateral dorsolumbar sympathectomy. This would suggest that arterial spasm was a dominant factor in the hypertension, peripheral vasospasm, and peripheral neuropathy. The vascular damage in such cases remains a single insult, which, if not permitted to progress through continuous hypertension, is reversible. The case is unique, because the probability that the periarteritis nodosa was due to thiouracil, or less likely to the concomitant iodine, as a sensitizing agent cannot be discarded. Both drugs were used in repeated courses for treatment of hyperthyroidism. The previously recognized hazard of repeated courses of drugs to which reactions may occur is reemphasized.

Resistance of Staphylococci to Penicillin.—Chandler and associates attempted to determine the proportion of resistant staphylococci present in a variety of infectious processes, to compare this with the proportion of penicillin-resistant staphylococci isolated from the noses and throats of healthy carriers, and to test both resistant and susceptible strains for the production of penicillinase in order to confirm the observation that there is a high degree of correlation between resistance and the production of penicillinase. Of the 50 pathogenic strains of staphylococci studied, 56% of the strains of Staphylococcus aureus and 38% of the strains of Staph. albus were resistant to more than 1 γ penicillin per cubic centimeter. Of the combined total, 52% f the 50 strains were resistant to more than 1 γ of penicillin per cubic centimeter. Of the 25 strains from carriers, only 18% of the strains of Staph. aureus and 14% of the strains of Staph. albus were resistant to more than 1 γ of penicillin. Of the combined total, 16% of the 25 strains were resistant to more than 1 γ of penicillin. All but one of the resistant strains produced penicillinase. None of the sensitive strains produced penicillinase. Exposure to aureomycin brought about a loss in the capacity to produce penicillinase, and this loss appeared to be irreversible. The clinical implications of these observations are that when, in the course of an infection that is being treated with penicillin, the infecting organism is discovered to be one that produces penicillinase, the substitution of another antibiotic to which the organism is sensitive is not only indicated but may at some later date allow the reintroduction of penicillin, if the organism loses its capacity to produce penicillinase. In the case of staphylococcic infections, the substitution of aureomycin for penicillin would seem to constitute a logical procedure in the light of the observations made in this study.

Studies on Action of Antacids in Human Stomach. F. B. Benjamin A. C. Ivy.—p. 618.

Peptic Ulcer of Esophagus.—There are two schools of thou on the etiology of peptic ulcer of the esophagus. One holds the coexistent short esophagus is congenital in origin and this variation permits a more or less constant exposure to ga secretion with the eventual production of an ulcer. The opp point of view supports the thesis that the ulceration is prin and that the subsequent scarring and longitudinal contrac bring the stomach into a herniated position. Exponents of opinions fail to account for the following factors: the freq finding of hiatal insufficiency with herniation but wit esophageal ulcer; the presence of ectopic foci of gastric mu in the lower third of the esophagus; the high frequency of ciated gastrointestinal lesions, such as gallbladder disease, tric and duodenal ulcers, and duodenal diverticuli; and appearance of the lesion at both extremes of life. The aut present the histories of six patients with peptic ulcer of esophagus who were observed at a Veterans Administration pital in the course of three years. An x-ray treated neoplas tonsil and neck existed in one patient, duodenal ulcer in patients, and cholecystic disease and diverticulosis of the bowel in one patient. Esophageal islands of ectopic ga mucosa were present in all of the patients. The authors feel these associated lesions probably played a part in the pa genesis of peptic ulceration in the esophagus, because mul factors and a combination of circumstances are probably ne sary in the great majority of cases of peptic ulceration in esophagus. Attention is called also to the frequency of obst tion in ulcers of this type, due either to functional spasm scarring. Dilatation should always be tried first, and resec should be considered only if the obstruction cannot be relie

Fatty Liver Following Aureomycin Therapy in Hepatic Disc —In 7 of 16 patients with chronic liver disease treated varying courses of aureomycin, an increase of liver fat was served following therapy. This change was also demonstr in two of three patients treated with terramycin. Associated this, an increase in body weight was noted in a significant n ber of patients. The possibility is considered that these cha are due to a disturbance of cellular metabolism by these stances, or to their effect on the bacterial flora of the colon both. It is also recognized that other mechanisms may responsible.

ythrodermia Occurring in Psoriasis After Use of Cortico- pin.—The case reported concerned a 12-year-old girl who s first seen by the authors on Nov. 29, 1950, with a history generalized eruption of six weeks' duration. A clinical diag- sis of psoriasis vulgaris was made, and local administration 1% ammoniated mercury ointment was started in an attempt loosen the scales. Treatment with corticotropin (ACTH) s begun Dec. 6, 1950, with a daily dose of 50 mg. accom- nied by 1.5 gm. of potassium chloride. On Jan. 5, 1951, the se of corticotropin was increased to 80 mg. daily. On the day fore, Jan. 4, a diffuse erythema began to develop. At the same ne the psoriatic lesions gradually faded and some scales came f. The erythema became completely generalized within the xt two weeks. Corticotropin was discontinued on Jan. 18. ithin a few days the erythema began to fade, starting first on the lower extremities. At this time a patch test with 2% ammoniated mercury ointment was found to be negative. The authors say that although erythrodermia may develop spontaneously in psoriasis, it is possible that in this case corticotropin was a cause.

Mucoid Impaction of Bronchi.—The occurrence of mucoid impaction of the bronchi resulting from a localized accumulation of inspissated mucus in the bronchi is reported in 10 patients between the ages of 14 and 57, all of whom had an underlying condition of asthma or chronic obstructive bronchitis. The descriptive term mucoid impaction of the bronchi has been used by the author to designate a distinct clinical entity within the lungs. Its presence causes a febrile episode. The associated cough is not severe. It may be a dry cough or productive of small amounts of mucopurulent secretion. General lassitude and a slight localized pleuritic pain may be present. Hemoptyses occurred in three of the author's patients. Typically mucoid impaction occurs in the second order branch bronchi distal to a bifurcation. The impaction grows in size, layer by layer, in a laminated manner to finally dilate the bronchial wall. The cartilaginous elements are almost entirely destroyed, and there is an infiltration of lymphocytes and eosinophilic neutrophils into the wall. The characteristic yellowish-white appearance of the normal bronchus changes to a reddish brown. Beyond the blocked bronchus suppuration occurs that may be in the form of a nonputrid abscess. At times the suppuration is entirely intrabronchial, occasionally causing the formation of cystic bronchiectasis. This and fibroid pneumonitis are residual sequelae to the bronchial obstruction caused by mucoid impaction. The roentgen appearance of the shadows cast by this disease may simulate tuberculosis, abscess, and neoplasm. Surgery may be indicated to rule out neoplasm and/or to remove segments of lung destroyed by suppuration beyond the impaction. Eight of the author's patients had pulmonary resections, and two are being observed who are receiving nonsurgical treatment, consisting of chemotherapeutic agents, expectorant cough mixtures, and bronchodilators. In four of the eight patients operated on, there have been recurrences of pneumonitis in other segments of the lung that were undoubtedly due to mucoid impaction of the bronchi. Satisfactory eradication of a destroyed segment or lobe by resection, thus eliminating the symptoms of mucoid impaction of bronchi, does not insure against recurrence of the same disease process. The prognosis of mucoid impaction as the complication of asthma is the prognosis of the underlying disease.

Treatment of Cardiospasm.—At the Mayo Clinic, 601 patients with cardiospasm, a nonorganic stenosis of the lowest portion of the esophagus, were treated during the 12 year period of January, 1935, to January, 1947, by dilatation, while 23 is the total number of patients with cardiospasm who were subjected to surgical treatment at this clinic. The cause of cardiospasm is not known, and hence a truly rational approach to the treatment of this disease has not been evolved. Whatever its etiology may be, the present methods of treatment are directed toward the relief of obstruction of the cardia. Exact diagnosis is important. Cardiospasm must be differentiated from diffuse spasm of the esophagus. Diffuse spasm does not respond favorably to either hydrostatic dilatation or surgical treatment. Hydrostatic dilatation is the treatment of choice for most patients with cardiospasm. Successful dilatation in the case of properly diagnosed cardiospasm depends on accurate placement of the dilator in the cardia and severe forceful dilatation of the physiological sphincter by an expanding dilator. A previously swallowed thread permits accurate placement of the dilator and adds to the safety of the procedure. Adequate follow-up studies were carried out in 452 patients treated by this method. Of these 452 patients, 272 (60.2%) obtained relief of dysphagia for periods of 4 to 16 years from a single course of dilatation. In the remaining 180, dysphagia recurred in less than four years. Of the 180 patients, 94 were given a second course of hydrostatic dilatations and 36 of them obtained relief of dysphagia for four years or more, while recurrences developed in the remaining 58. If satisfactory results are not obtained with two courses of hydrostatic dilatations, additional treatment is likely to be of little avail. It must be anticipated that about 20% of the patients cannot be permanently relieved by dilatation. Surgical treatment should be considered for those patients who fail to respond to two or three courses of dilatation therapy. Every effort should be made to carry out surgical treatment before pronounced changes in the esophageal wall have taken place. The Heller operation, which permits the cardia to retain some of its sphincteric property, appears to be the most advantageous surgical procedure. Follow-up of the 23 patients with cardiospasm who underwent surgical treatment showed that late results were not favorable, because most of the patients selected for surgical treatment had far-advanced cardiospasm for which dilatation therapy was impossible or had failed to give relief. Most of the operative procedures carried out permitted reflux of gastric secretions into the esophagus. Peptic esophagitis and ulceration were responsible for most of the poor results.

Comparison of Cocaine and Pontocaine.—This paper reviews experimental and clinical observations on the relative toxicity and potency of cocaine and tetracaine (pontocaine®), two topical anesthetics that are widely used for topical anesthesia in otolaryngology. The mean fatal doses of cocaine and tetracaine were determined in guinea pigs by introduction of solutions
slowly into the trachea. By this method the mean fatal do
cocaine was 24 mg. per kg. of body weight and of tetra
7.2 mg. per kg., giving a relative toxicity of tetracaine to coc
of 3½:1. The usual clinical practice of using tetracaine in c
fifth the concentration of cocaine might be expected to g
tetracaine a slight advantage in safety. This, however, was
confirmed by the clinical survey. Clinical tests of 5% coc
and 1% tetracaine by application to the nasal septum sho
that the time of onset of anesthesia was about twice as l
with tetracaine as with cocaine. The duration of anesthesia
about equal with the two drugs, although the time of applica
of the cocaine was shorter. In a survey of some of the la
clinics in the United States and Canada with reference to
use of these two drugs, it was found that cocaine is by far
majority choice in clinical use. Complications of a severe na
and deaths were found more frequently with the use of t
caine. Cocaine has long years of useful service as a top
anesthetic, and its vagaries are well known. It is still prob
the most satisfactory of these two drugs for use in otola
gology.

**The Rapid-Rocking Bed in Poliomyelitis with Respirato
ralysis.**—In 1932 Eve demonstrated rocking to be an ef
method of artificial respiration. During the past two yea
rapid-rocking bed has been used at the New York Hosp
supply artificial respiration to poliomyelitis patients wit
piratory paralysis of the spinal type. Two rapid-rocking
equipped with footboards and Gatch attachments for the
and head were used. They were run at a maximum rocking
of 40 to 44 degrees (20 to 22 degrees in each direction fro
horizontal), usually at rates of from 16 to 24 cycles per m
Fifteen patients with respiratory insufficiency recovering
acute anterior poliomyelitis were transferred from tank
pirators to rapid-rocking beds as soon as their tempe
reached normal and they could breathe unassisted fo
minutes. The time spent out of the respirator and on the
ing bed were increased each day. As indicated by tidal v
and vital-capacity measurements, the rapid-rocking bed br
about marked increases in ventilation over that of the r
state. Although the tidal volumes produced by rocking we
so great as could be attained by tank respirators, adequate
tive alveolar minute ventilations were produced in all con
cent patients. Substitution of the rapid-rocking bed fo
respirator early in convalescence facilitated nursing car
physiotherapy and prevented fixation of the diaphragm. Ro
aided the restoration of independent breathing and en
several patients to overcome their dependence on the respi
Of the five patients with acute poliomyelitis and moderat
piratory insufficiency who were treated on the rocking bed
had to be transferred to tank respirators to correct fa
carbon-dioxide retention, or anoxemia and the fifth obt
barely adequate ventilation. Frequent spirometry and seri
terminations of carbon dioxide combining power gave val
information about the regulation of artificial respiration.

ascia Lata Applied as Graft About Arteries.—Experimental perations were designed that produced trauma and weakening f the aorta in animals similar to that produced in human subects following thromboendarterectomy. Following such operations, release of the clamps occluding the aorta resulted in bleeding from the suture line and rapid dilatation of the weakened egment. The application of fascia lata grafts about the aorta revented this bleeding and dilatation and gave adequate support o the weakened arterial segments. Six patients with occlusion f major arteries due to arteriosclerosis have been treated by hromboendarterectomy of the thrombosed arteries. The length f the thrombosed segments varied from 7 to 22 cm. There were o operative deaths, but two patients died in the postoperative eriod from cerebrovascular thrombosis. Amputation was evenually necessary in two patients, owing in one to chronic thromosis of distal arteries too small to be amenable to surgical reatment. The arteries from which the thrombus had been removed remained patent in all cases. Fascia lata was used to give dditional support to the weakened arterial segments in three ases. One patient with an aneurysm of the abdominal aorta s discussed in whom both dilatation and partial thrombosis were resent. After thromboendarterectomy of the dilated aorta had een accomplished, the use of fascia lata as an external suporting layer made the performance of restorative aneurysmorhaphy possible.

erum Enzymatic Response After Stimulation of Pancreatic ecretion.—While conducting experiments designed to evaluate modifications of the so-called secretin test, the authors of this aper became interested in the study of the serum enzymes iastase and lipase as an aid in the diagnosis of subacute panreatic disease. The pancreas of patients with and without panreatic disease was stimulated concurrently with secretin and methacholine chloride (mecholyl®). Tests were made on 52 paients, divided into a control group without pancreatic disease, group with proved pancreatic disease, and a group with susected pancreatic disease. Individual responses of serum diastase within these groups follow a uniform pattern and are consistent nough to suggest that this study may be valuable in the clinical valuation of patients with pancreatic disease. Serum lipase responses did not appear to follow a consistent pattern when ssayed one hour after stimulation. The possible mechanism f serum diastase elevation when seen in patients without panreatic disease is discussed, and the pathological factors that may account for the consistently greater response seen in patients with certain disease of the pancreas are considered. These tests appear to be applicable to the study of subacute pancreatic disease and perhaps early neoplasm of the pancreatic gland. In a case of probable carcinoma of the pancreas positive results were obtained. The possible sources of error are discussed. Further clinical study is needed. No adverse reactions should be encountered in concurrent use of secretin and methacholine if certain precautions are followed.

Antethoracic Jejunal Transplantation in Congenital Esophageal Atresia.—A primary end-to-end anastomosis of the esophagus with closure of the tracheal fistula has been accepted as the procedure of choice in all cases of congenital esophageal atresia with tracheo-esophageal fistula when the anomaly is such that the ends of the esophagus may be satisfactorily approximated. Many different types of multiple stage procedures for esophageal reconstruction have been described for the treatment of anomalies unsuitable for primary anastomosis, but the long period of hospitalization, the numerous complications encountered in the multiple operations, and the uncertain end results have suggested to some surgeons that a primary esophageal anastomosis should be the only operative procedure considered and that, if such an operation is not feasible, no further attempt should be made to prolong the patient's life. In more recent years attempts to perform an esophagogastrostomy after advancing the stomach into the left side of the thorax have met with some success in cases of congenital atresia. This procedure has the advantage of offering success or failure in one stage. There have been few reports of successful outcomes in patients so treated and few detailed follow-up studies. This report presents a method of esophageal reconstruction that has been used successfully in two newborn infants who had hypoplasia of the lower esophageal segment. Antethoracic esophageal reconstruction was accomplished by mobilization and transplantation of a segment of jejunum long enough to extend from the cervical esophagus to the stomach. The first operation was performed in three stages and the second in two. Sixteen days intervened between the two stages of the second reconstruction. In both cases function of the reconstructed esophagus has been satisfactory and general development has been normal in the two-year period since completion of the procedure. Experience gained from these operations would suggest that the mesenteric vascular supply of the very young infant is sufficiently labile to permit performance of this procedure regularly for the treatment of hypoplasia of the lower esophageal segment. Both stages of the antethoracic esophageal reconstruction are well tolerated during early infancy, and satisfactory continuity of the alimentary tract may be established during the first few weeks of life.

Polyethylene Catheter for Prolonged Tube Feeding.—The irritating effect of rubber feeding tubes that are left in place for periods exceeding a week is well known. Ulceration and erosion of the mucosa of the nasopharynx and esophagus may be caused. Usher recently used a polyethylene catheter for prolonged gastric tube feeding with great success. This catheter was originally intended for replacement transfusions in infants and for constant intravenous therapy in older children and adults; its inside diameter measures 0.047 in. (0.12 cm.), and the outside diameter is 0.067 in. (0.17 cm.). Two cases are reported in which tube feeding with the polyethylene catheter was maintained for four-month and two-month periods with no erosion or ulceration of the pharynx or esophagus and with no discomfort to the patient. The small diameter of the tube and the ease with which it was passed in the presence of considerable edema of the throat suggests that it might be used for feeding in benign and malignant strictures of the esophagus.

Khellin Aerosol in Bronchial Asthma.—Pharmacological studies have shown that khellin, an extract of the seeds of Ammi Visnaga, relaxes the smooth muscles. This property has been demonstrated in the coronary vessels, the intestines, the ureters, and the bronchi. Khellin has been used extensively in patients with angina pectoris, and favorable results have been reported by a number of authors, whereas others have asserted that it has no more effect than a placebo. Braun and Eilender used Khellin in the form of an aerosol spray in 10 patients with acute bronchial asthma. The vital capacity and tidal air were recorded before and shortly after the administration of 7 mg. of khellin in an aerosol spray. All 10 patients showed a decrease in dyspnea, diminution of wheezing and rales, and an increase in the vital capacity. The effect of khellin on tidal air was not pronounced.

*Studies on Castle's Extrinsic Factor. R. Gordin.—p. 199.

Myocarditis in Poliomyelitis.—Electrocardiograms made of 265 patients with poliomyelitis who were hospitalized in the course of 10 years were normal in 181 patients (89 female and 92 male) and abnormal in 84 patients (52 female and 32 male); i. e., in 31.7%. There was no increased incidence of pathological electrocardiograms during any particular year. Abnormal tracings were observed more frequently in patients aged over 10 than in younger patients. No particular sex disposition was noted. Pathological electrocardiographic tracings were rare in nonparalytic poliomyelitis. In patients with the spinal type of poliomyelitis associated with moderate paresis, the incidence of abnormal electrocardiograms was 25.5%, while in patients with spinal type and with extensive involvement it was more than 50%. In bulbar poliomyelitis it was 40%. In 50 patients several electrocardiograms were taken during an observation period of two days to eight months. Patients with normal electrocardiograms obtained during the acute phase of poliomyelitis did not show electrocardiographic evidence of myocardial lesions during the further course of the disease. Of the 84 patients with abnormal electrocardiographic tracings, 4 showed delayed auriculoventricular conduction time for one week, 4 showed disturbance of coronary sinus rhythm, which improved within two days in 2, 15 presented pathological P waves in leads 2 and 3, and 21 showed abnormal P waves, ST intervals, and T waves, which were usually transitory, and 40 showed transitory abnormal ST waves and/or abnormal T waves. The electrocardiogram became normal in 34 of the 50 patients in whom repeated records were obtained. A clinical diagnosis of myocarditis was not made in any of the patients. In two of three patients who died microscopic examination of the myocardium revealed cellular infiltration of the interstitial tissue of the auricules and ventricles, and in one it showed pronounced fibrous tissue formation, cellular infiltration, and fragmentation of myocardium. The gross appearance of the heart was normal in all three. Definite conclusions as to the incidence of functional changes or of changes of acute myocarditis could not be drawn on the basis of these cases.

Castle's Extrinsic Factor.—To trace and produce in the purest possible form a substance acting as an extrinsic factor, experiments were performed on 17 patients with cryptogenetic pernicious anemia who were given substances other than ordinary meat by mouth, with gastric juice used as the intrinsic factor. The substances used as the extrinsic factor were peptone, fibrin hydrolysate (aminosol®), crude meat extract, pure meat extract, raw ground liver, liver extract ("heptomin") and vitamin B
good effect was obtained with peptone, different meat ex
small quantities of liver and liver extract, and small doses (
of vitamin B_{12}. Tests with fibrin hydrolysate gave less sat
tory results. The amount of intrinsic factor contained in 4
of normal gastric juice proved sufficient as a daily dose. Ch
cal analyses of fibrin hydrolysate and peptone demonstrated
these substances do not contain cobalt. Consequently, the
played by cobalt in the extrinsic factor effect, as suggested
Smith and Rickes, with respect to vitamin B_{12}, seems to
debatable.

"Benign" Pyelonephritic Hypertension.—The occurrence
benign pyelonephritic hypertension is reported in a man
30, who at the age of 8 began to have repeated attacks of
ache associated with nausea and vomiting. At the age
albuminuria occurred for the first time. At the age of 10
patient had nycturia, coliuria, leukocyturia, and mild alb
nuria. The dilution test showed some delay in excretion,
concentration test revealed hyposthenuria; the nonprotein
gen was mostly normal. Roentgenologic examination sh
a slight, clubshaped dilatation of the pelvis of the left ki
and of the calices. Blood pressure varied from 160/1
195/170. The fundus oculi presented the aspect of severe
nuric, angiospastic retinitis. A diagnosis of chronic pyel
ritis associated with malignant hypertension was made, a
unfavorable prognosis was given. In the course of the foll
years the condition of the patient improved considerabl
that he was able to take part in sports. At the age of 12 h
rheumatic pancarditis with resulting permanent aortic i
ciency. The pyelonephritic condition did not change, but
was a mild regression in hypertension and nearly complet
appearance of the neuroretinitis. Growth was normal, a
the age of 30 the patient had no subjective complaints. H
still leptosomatic. The pubic hair was of female type,
pressure was 160/85, the urine findings were the same
the age of 10, and the nonprotein nitrogen was normal.
case first was considered as an exception to the rule that
hypertension is malignant, but 10 additional cases of b
pyelonephritic hypertension were observed in seven femal
three male patients in whom the essential symptoms of h
tension and chronic pyelonephritis persisted for many y
Not all the patients presented the full syndrome, which
includes hyposthenuria or isosthenuria and nocturia, which
cause nocturnal enuresis and may be the first sign of the ill
Disturbances of the electrolyte pattern of the extracellular
occurred occasionally. In these cases pyelography often rev
bilateral clubshaped dilatation of the calices and shrinka
the renal pyramids. It is suggested that the hypertensi
caused by an inflammatory irritation of the renin-producing
of the distal tubules rather than by ischemia impairing the
ney function as postulated by Goldblatt.

omparative Value of Amebacidal Drugs.—The commonly ed amebacidal drugs, emetine hydrochloride, diiodohydroxy-inoline (diodoquin®), emetine bismuth iodide, carbarsone and iniofon, and some others, all used singly, were given a thera-utic trial in several hundred African native patients with acute cerative amebiasis. Each series treated with one of the ex-rimental drugs usually comprised about 50 patients, and 50 ditional patients, who received no treatment, served as con-ols. Emetine hydrochloride was administered intramuscularly doses of 1 grain (60 mg.) for 15 days. Emetine bismuth iodide s given by mouth in doses of 3 grains (0.2 gm.) in com-essed enteric-coated pills and later only in plain gelatine cap-les, nightly for 10 nights. Diiodohydroxyquinoline was given doses of 3 tablets (0.21 gm. each) three times daily for 20 ys. Carbarsone was given in doses of 4 grains (0.25 gm.) ice daily for 10 days. Chiniofon was given in doses of 0.5 . three times daily for three days and then 1 gm. three times ily for seven days. The criteria of diagnosis and response to eatment were rigid. Results give information on the value of e test drugs only in clearing the patients of symptoms, ulcers, d amebae after 20 days from the start of treatment. Results follow-up examinations or permanent clearance were not ported. Emetine hydrochloride, diiodohydroxyquinoline, eme-e bismuth iodide, and chiniofon appeared to have a statis-cally similar effect, with absolute failures numbered 27% and ccesses 55%. Only those patients were accepted as successes whom all visible ulcers were healed, with clearance of amebae. he high absolute failure rate of 46% with carbarsone placed is drug in a lower category of usefulness. With all of these e drugs there was a high percentage of unimproved patients. netine bismuth iodide must be given in gelatine capsules; the anufacture of the drug in compressed pills should be discon-ued. Other drugs recently placed on the market, such as bis-uth glycolylarsanilate (milibis®) and chloroquine diphosphate ralen®) were found to be inferior to emetine and cannot be commended for intestinal amebiasis. It is emphasized that this mparison of the effects of amebacidal drugs used singly should t be considered as a recommendation for individual therapy. previous papers the authors showed that some antibiotics hen used either alone or in combination with amebacidal agents ere far more efficacious.

ormone Implants in Man.—The implantation of pellets is a ell-established method of administering steroid hormones. Ob-rvations were made from 1942 to 1944. The pellets used con-sted of pure crystals of the hormone without diluent or cipient. They were of two types: cylindrical cast or fused pel-ts, and compressed pellets in the shape of cylinders with con-x ends. Nine hormones or their esters were studied, and herever possible a comparison was made between fused and mpressed pellets. In the case of diethylstilbestrol and hexestrol ly compressed pellets were used, because fused pellets of these bstances tend to disintegrate. Implantation was made subcutaneously into the antecubital fossa or into the subscapular region. The pellets were removed at various intervals after implantation, and their absorption rate was studied. The compounds were rated in descending order of absorption rates as follows: compressed testosterone, compressed and fused androstenedione, fused progesterone, fused testosterone, compressed hexestrol and diethylstilbestrol, compressed and fused testosterone propionate, compressed estradiol dipropionate, fused desoxycorticosterone acetate, and compressed and fused estradiol. Calculations of the half-life in days and the amount initially absorbed daily corresponded with clinical observations regarding the duration of alleviation of symptoms, considering that the clinical effects disappear some weeks before the pellet has theoretically been completely absorbed.

Flat Fingernails in Cirrhosis of Liver.—In the peculiar abnormality described, the fingernails lose their typical curvature and become flat, as if compressed, but the finger tips, the muscles, and the bones of the terminal phalanges remain unchanged, unlike those of hippocratic fingers. The nail beds are usually whitish or light pink, possibly owing to anemia. Whether the surface of the nails is smooth or lined depends on the patient's age. Even with long parallel lines the flatness persists. This anatomic change has no influence on the function of the hands, is not painful, and has no effect on the sensitivity of the fingertips. Not all the fingers are necessarily affected. The change begins with one finger, usually the thumb, the first and middle fingers being next in frequency. The first patient in whom the author observed this abnormality was a heavy drinker, who was in a very advanced stage of typical alcoholic cirrhosis of the liver. A second patient had typical biliary cirrhosis due to cholangitis. A third patient had hemochromatosis and all the signs and symptoms of hepatopancreatic cirrhosis with typical changes in the skin. In a fourth patient cirrhosis had probably developed after two severe attacks of infectious (virus) hepatitis; a fifth patient had Banti's syndrome. Since the causes of the hepatic cirrhosis in these cases were different, it is probably the cirrhosis itself that causes these changes in the nails, not the conditions producing the cirrhosis. The patients with the flat nails had the following changes in common: (1) long-standing and advanced cirrhosis, positive liver tests, and low hemoglobin values. The author observed such nails also in one healthy man, who until the age of 12 had subsisted on a vegetarian diet and who had been subject to frequent fractures until the diet was changed.

Treatment of Burns.—Colebrook surveys the experiences in two centers specializing in the treatment of burns over the last eight years. In such treatment the principal aim should be to eliminate infection. The remarkable benefit accruing from such a policy is demonstrated by the fact that in six years, the over-all death rate has fallen from 10% to 4.5%, and a further reduction seems possible. Pain is slight or nonexistent in burns that remain uninfected. Furthermore, the average hospital stay has been reduced from 50 to 30 days, largely owing to the increased use of early skin grafting of the deep burns. But the success of that policy has been closely bound up with the control of infection. The author feels that the more completely we eliminate infection, the larger will be the part that surgery can play in the treatment of severe burns, with great advantage to the patients and great saving of hospital beds. Every hospital should have a properly air-conditioned dressing room, but it is probably not practicable for every hospital to have always available surgeons with considerable experience in the management of burns, shock, or the special problems of extensive resurfacing. For severe burns, it probably would be best to have special centers specially equipped and staffed for dealing with burns. The badly burnt patient is as difficult an "emergency" as is a patient with a serious injury of an eye, the brain, or the face. Such patients are sent to special centers to be treated by surgeons with long experience in their management and so it should be with burns. The author's experience in Birmingham suggests that from 40 to 50 beds would be needed for a population of half a million people, if the number of burn accidents continues at the same high rate. How to reduce that number is perhaps the most important of all problems in connection with burns.

Recurrent Abdominal Pain in Children.—Keith and O'Neill observed that among outpatient children emotional tension and recurrent abdominal pain often occurred together. To find out how commonly the repeated attacks of abdominal pain were part of an emotional state, a consecutive series of 25 children with this symptom were investigated. The children ranged in age from 3 to 16 years. Attention was given to habits of eating and sleeping, behavior at home and at school, and the family atmosphere and home environment. Besides a clinical examination, x-ray films of the chest were taken in almost all cases, and special tests, such as the barium meal and electroencephalography, were done when indicated. During the psychiatric examination, the first few sessions were as a rule with the mother alone; at later visits the mother and the child were interviewed separately. Puppets to represent members of the family, schoolteachers, and friends were used to enable younger children to make their motives and feelings comprehensible to the observer. The nature of the pain in four children remained obscure. The remaining 21 children are divided into two groups. In 15 emotional excitement was the principal determinant of attacks of pain, and the time relationship between the two was plain. In the remaining six children emotional excitement was one determinant among others, and physical agencies, such as eating too fast, seemed to explain some attacks. The authors cite examples of attacks associated with anxiety, with anger, or with grief. Of the 21 children whose attacks were related in some way to stress, 17 had other signs of tension, such as headaches, poor sleep, bad dreams, fits of crying, irritability, stammer, restlessness, tics, fidgeting, and nail-biting. The attacks of pain seemed to be one component of an "adaptive disorder," which manifested itself also in these other ways. The phenomena mentioned above, like the attacks of pain, were worse in conditions of stress, and improved with psychotherapy. Of the 16 patients who were treated at some length, 2 continued to have symptoms as before; 6 showed some improvement; and 8 ceased to have attacks and improved in general health.

Accelerated Skeletal Development from Thyrotoxicosis and Thyroid Overdosage.—Three cases are reported that illustrate the effect of excessive thyroid secretion or overdosage of thyroid extract on growth and skeletal development of children. In the first case, a girl, aged 3 years 11 months, had a two-year history of excessive restlessness and irritability that had become worse during the preceding two months and was associated with swelling of the neck and protrusion of the eyes. She was tall and heavy for her age, and the diagnosis of thyrotoxicosis was confirmed by the presence of a goiter, tremor and sweating of the hands, tachycardia, an increased basal metabolic rate, and by subsequent excellent response to methylthiouracil therapy. The skeletal development was about two years too advanced. The second case concerned a mongoloid who had been given thyroid extract for nearly four years. She presented typical mongoloid features but was obviously tall for her age. In addition, she had bilateral congenital cataracts with exophthalmos, a palpable right lobe of the thyroid gland, and a congenital heart lesion. The rate of growth and skeletal development, which was 18 months too advanced, were remarkable for a mongoloid, in whom the opposite is to be expected, especially in the presence of a congenital cardiac lesion. These features were therefore considered to be the result of continuous thyroid treatment in the presence of a normal gland. The third child was a cretin who had also been treated with thyroid extract and who had signs of thyrotoxicosis, a voracious appetite, persistent tachycardia, sweating, accelerated growth, and skeletal development two years too advanced. The authors say that although more than 750 ca of thyrotoxicosis in children have been published, acceler skeletal development is rarely mentioned. It was first noted b Holmgren in 1906. The delayed growth of bone and dwarf stature characteristic of juvenile hypothyroidism can be correc by adequate thyroid medication; but, if the dose is exces and treatment given too long, the correction proceeds too f accelerating ossification, with the danger of early epiphy union, bringing growth to a standstill. Though blood-choles levels and serial electrocardiograms show whether the dos of thyroid is adequate, serial radiography of the skeleton a measurements of height help to prevent overdosage.

Preoperative Trial of "Veritol-Test." F. R. Banchieri.—p. 283.
*Estrogen Therapy of Mammary Cancer. A. Astuni and G. Dal —p. 294.

Estrogen Therapy in Mammary Cancer.—Nine patients w primary or recurrent inoperable mammary cancer were trea with a synthetic water-soluble estrogen preparation, diethyls bestrol disulfate. The drug was administered intravenously tw a day in doses of 40 mg. each for 25 days, with a total d of 2 gm. All the patients were menopausal, including o woman, 29, who had previously undergone oophorectomy. T product was tolerated without side effects by all of them. I gression of the tumor, which had become movable, was so p nounced in a woman, 70, that surgical intervention, imposs before, was justified after the treatment. In a patient 64, large-sized tumor subsided almost completely, enlarged axill lymph nodes disappeared, and the patient has been well for o and a half years. Decrease in the size of the lymph node m stasis was observed in a woman 65, who showed also tempor but pronounced improvement in the general condition. Th other patients, 49, 29, and 46, respectively, were improved, pain caused by bone metastasis diminished, although no impr ment in bone metastatis was demonstrated by roentgenogra examination. A patient 55, who was admitted to the hosp with pertrochanteric fracture of the left femur due to b metastasis occurring three years after mastectomy for cance the breast, made a complete recovery with recalcification of lesion; however, this encouraging result cannot be [illegible] only to the estrogen therapy, because it was combined roentgen therapy. Results were doubtful in another woman in whom the estrogen therapy was also combined with [illegible] therapy. One patient 64, who because of severe circulatory turbance received only 40 mg. of the drug per day (*total d* 740 mg.), was a therapeutic failure. Thus, estrogen *therapy* proved to be a valuable adjuvant in the treatment of mamm cancer. But because of the only partial and temporary the authors believe that it should be limited to cases of p or recurrent inoperable mammary cancer.

Glycoprival Malnutrition in Infants.—Clinical observations reported on infants in whom nutritional disturbances w accompanied by considerable reductions in blood sugar val and by a fall in temperature, which at times caused severe c lapse or collapse-like crises. Such cases of glycoprival inanit are not caused by one factor alone. This is proved by the obs vation that not every case of dystrophy resulting from nut tional disturbances is accompanied by a reduction in blood sug The fact that the oral administration of sugar is rapidly f lowed by a lasting increase in the blood sugar content, where intravenous administration of dextrose after a temporary increase of about an hour and a half is again followed by a rapid decrease in blood sugar, seems to indicate the importance of the liver in these processes. As a result of severe depletion in its glycogen stores the liver seems no longer capable of supplying the energy requirements of the peripheral parts of the body by way of the blood sugar. This glycogen deficiency can be traced to a reduced absorption of carbohydrates as the result of prolonged dyspepsia. Apparently, an inhibition of the phosphorylation processes plays a part in the absorption and metabolism of carbohydrates. This concept is further supported by Diehl and Thaddea, who assume that the weakness or toxic impairment of the adrenal cortex in Addison's disease is a sequel of chronic gastrointestinal disturbances. The blood sugar crises in the course of severe dyspepsia, or glycoprival inanition, make it necessary to investigate the blood sugar values in all severe nutritional disturbances.

Hydrocephalic Disturbances During Streptomycin Therapy of Tuberculous Meningitis.—This paper reports on air encephalography in 52 children with tuberculous meningitis. The introduction of small quantities of air is usually adequate, especially if chief emphasis is placed on fluoroscopy. A rather severe dilatation of the ventricle system was observed in 41 of the 52 children. If treatment is begun early or in cases that are rapidly fatal, the hydrocephalus is usually slight or is completely absent. The primary localization of the disease process seems to be of particular importance for the absence or the late appearance of hydrocephalic dilatation. This is demonstrated in several examples. Asymmetry of the dilated lateral ventricles was relatively frequent. The frequent concurrence of severe hydrocephalus and primary atrophy of the optic nerve seemed especially noteworthy. In addition to inflammatory hypersecretion a disturbance of the resorption must be held responsible for the development of the hydrocephalus; this could be proved with the aid of the iodine test. The extent of the hydrocephalus plays an important part in the prognosis of tuberculous meningitis. Retrogression of dilated ventricles was observed in three cases. The author calls attention to the possible dangers of encephalography in cases of tuberculous meningitis and stresses the need of careful selection of cases. If air is introduced during the interval when no treatment is given it is advisable to give streptomycin concurrently.

Experiences with Testing Function of Adrenals by Means of Epinephrine. B. Oldenziel.—p. 2257.
*The Sign of Tonelli. G. C. J. Kruisinga.—p. 2270.

Psychosomatic Aspects of Intraocular Pressure.—Most ophthalmologists have known of cases in which an attack of acute glaucoma was preceded by emotional shock. Some cases of this type are cited and evaluated. The connection between the autonomic nervous system and glaucoma is reviewed with regard to the psychogenetic origin of this disorder. Experiments revealed, however, that very severe emotional shock exerts no influence on the ocular pressure of persons with normal eyes. With the aid of hypnotic methods it was possible to establish correlations between ocular pressure and emotional conditions in cases of psychogenic glaucoma. The psychogenesis of glaucoma should be investigated, and psychosomatic treatment should be tried in cases of glaucoma.

Tonelli's Sign.—In 1932 Tonelli called attention to the fact that when pressure on the eyeball results in a change in the shape of the pupil, this may be regarded as a sign of death. He regarded this as an aid in the differentiation between apparent and real death. Bilateral or multilateral pressure is exerted on the eyeball at the border between the cornea and sclera. Some investigators questioned the reliability of Tonelli's sign, but Kruisinga shows that many factors indicate the reliability of the sign. He feels that 9 negative cases among Lignac's 3,419 positive ones amounts to a very small percentage, nevertheless, this indicates that the sign is not 100% reliable. Tonelli's sign should be further investigated.

*Treatment of Hyperthyroidism with 1-Methyl-2-Mercaptomidazole. J. Schermann and J. Affonso Escosteguy.—p. 463.

Treatment of Hyperthyroidism with Methimazole.—Schermann and Affonso Escosteguy administered methimazole ("tapazole") to 10 patients with hyperthyroidism. The patients were from 30 to 60 years old. The group was comprised of one patient with typical exophthalmic goiter, six with diffuse toxic goiter without exophthalmos, two with toxic adenoma, and one with recurrent hyperthyroidism, eight years after thyroidectomy. The patients were also given a barbituric sedative on retiring. Two patients were in remission after administration of daily doses of 100 and 50 mg. of propylthiouracil. Remission was maintained in these patients by the administration of methimazole in daily doses of 1 mg. for every 5 mg. of the previously given propylthiouracil. The six patients who had not had previous treatment, as well as two who reported failure of either iodide or propylthiouracil, were given methimazole in progressively diminished daily doses from 20 to 5 mg., and in rare cases from 30 to 5 mg. The dose was diminished as the patients improved. Remission was obtained in all cases after treatment for a period varying between two and five months. Although the number of cases is small and the time of observation very short, the results obtained were good. Methimazole is the most efficient antithyroid drug employed to date, being almost devoid of toxic reactions and allowing a control of hyperthyroidism at least as satisfactory as, and quicker than, with the other methods previously used. An exact scheme of doses and duration of treatment cannot yet be fixed.

Nitrogen Mustard in Multiple Sclerosis. J. Simarro Puig and J. Llor Casanovas.—p. 393.
*New Treatment of Pemphigus (Results of Application of Occlusive Bandages). J. Gómez Orbaneja.—p. 397.

New Treatment of Pemphigus.—Gómez Orbaneja reports on application of occlusive bandages under pressure in the treatment of pemphigus. The bandages were applied according to the method of Koch in the treatment of extensive burns. The treatment consists of application of lint in a form of trellis, the lint being soaked in an emulsion of sulfathiazole in olive oil (or in olive oil and water). The lint is covered with gauze and cotton to form a bandage 10 or 15 cm. thick, and the whole is fixed with wide strips of adhesive. In pemphigus, this bandage should cover the entire trunk and limbs. The bandage is removed after two weeks, and is reapplied two or three days later for another two weeks. As a rule, patients feel relief as soon as the bandage is applied. Appetite and general health improve. The skin appears normal when the first bandage is removed, but new small lesions may appear and will require application of a second bandage. In the patients reported on the diagnosis was confirmed by biopsy. All previous treatments, including suramin sodium (germanin), blood transfusions, diuretics, and thiosemicarbazone, failed. The Nikolsky sign was positive before the treatment and negative when the first bandage was removed. The treatment gave good results in all cases. In two patients who were followed up for more than one and one-half years after the treatment, the skin had been normal by the end of the treatment and is still normal. The Nikolsky sign is negative, and the general health is good. New pemphigus lesions did not appear.

*Brucellosis: Laboratory Autoinfection. V. Márquez Biscay and A. Fors Carbonell.—p. 151.
*Mammary Cancer in Young Girl. N. Puente Duany and C. García Ramírez.—p. 175.

Brucellosis: Laboratory Infection.—Márquez Biscay and Fors Carbonell report their own cases of laboratory brucellosis, which occurred after handling virulent cultures of Brucella suis and Brucella abortus for six days, despite all the usual precautions.

Two months later the workers complained of acute bronchial catarrh, which could not be controlled by any of the treatments in common use. One of the patients received an autovaccine, containing 100,000,000 catarrhal organisms from the respiratory tract. This vaccine had been previously given to the patient without producing reactions of hypersensitivity. However, on this occasion the vaccine caused an acute general and local reaction of hypersensitivity, with chills, tremor, general malaise, high fever, and headache. The local reaction was acute, and the bronchial catarrh became worse after administration of the vaccine. The reaction subsided but was repeated 10, 20, and 30 days later by administration of the vaccine in the same dose, half and one-fourth of the dose, respectively (100,000,000, 50,000,000, and 25,000,000 bacteria). The other patient received sulfadiazine, streptomycin, and penicillin in small doses with transient improvement of catarrh. In both cases brucellosis followed its typical clinical course for two months, when a certain diagnosis of brucellosis could be made from the hemogram, the erythrocyte sedimentation rate, the strongly positive agglutination to Brucella, and positive blood cultures with Brucella abortus. The opsonic index was very high all through the disease. The treatment consisted of aureomycin in daily doses of 2 gm., up to a total dose of 7.25 gm. in four days, and chloramphenicol (chloromycetin®) in daily doses of 3 gm., up to a total dose of 60 gm. in 20 days. Spectacular results were obtained within two days. The agglutinins slowly diminished and disappeared within six months. Cure has lasted up to writing, 10 months after treatment.

Mammary Cancer in Young Girl.—According to the authors, mammary cancer is very rare in young girls. The subject of this report was a girl 11 years old. The first symptom to appear was a fixed tumor on the tibia, simulating osteomyelitis. Roentgen examination showed local destruction of the bone. Biopsy showed undifferentiated epithelioma. Shortly after, a rapidly growing tumor appeared on the right breast, and enlarged lymph nodes appeared in the right inguinal region. Biopsy of the involved breast and of an inguinal lymph node showed the same type of epithelioma as that of the tibial metastases. The predominant symptom in this case was a large metastasis in the internal iliac fossa, with compression of the external iliac vein s the cause of enormous edema of the leg. Roentgen therapy d testosterone in large doses failed. Administration of nitrogen ustard in daily doses of 5 mg. for four consecutive days caused temporary improvement of the mammary tumor and of the metastases, but the symptoms became worse, together with the aggravation of the symptoms of metastatic cancer of the lung, later discovered by chest roentgenogram. The duration of the disease from appearance of the first symptoms up to death was nine months.

*Tuberculin Reactions in Tuberculous Reinfection. G. Costantini and A. Alberani.—p. 65.

Some Modern Aspects of Tuberculous Allergy. M. Anzalone.—p. 76.

Electrocardiogram in Tuberculous Toxemia. T. Lubich and G. Faenzi. —p. 89.

Tuberculin Reactions in Tuberculous Reinfection.—A study of skin reactions occurring after intradermal injection of old tuberculin was made in 260 adults, of whom 57 were healthy members of a staff of a sanatorium, and the rest were patients hospitalized in the same sanatorium. Evaluation was based on the extent of the erythematous reaction. A reaction with a minimum diameter of 10 mm. was considered positive. Readings were made 24, 48, and 72 hours after the injection. Of 60 patients with the exudative type of tuberculosis, 47 gave positive and 13 gave negative reactions. Of 83 patients with the productive type, 70 gave positive and 13 negative reactions. Of 31 patients with chronic pulmonary tuberculosis, 20 gave positive and 11 negative reactions. Of 12 patients with adenopathy of the hilus, 10 gave positive and 2 negative reactions. Of 17 patients with pleurisy, 12 gave positive and 5 negative reactions. Many patients with tuberculous lesions gave negative reactions to the intracutaneous tuberculin test, despite the fact that influenza, malaria, neoplasms, and hepatic lesions, considered to be
anergizing factors in patients with tuberculosis, were not pres
Various theories have been advanced to account for the nega
tuberculin reactions given by patients with tuberculosis. Th
authors attribute great importance to the person's biolog
condition. Constitutional, genotypic, and endocrine factors, a
well as the autonomic nervous system, may not only be r
sponsible for different aspects of the various forms of tubercu
sis, but may also induce alterations of the allergic condition a
particularly of the allergic response of the skin. The natu
defense power against bacterial infection is hereditary and
specifically or nonspecifically linked with the biological con
tion of the person subjected to the tuberculin test. Today t
intracutaneous tuberculin test has lost much of its significa
with respect to prognosis and diagnosis of tuberculous foci in t
human organism. The problem needs to be revised.

Chronic Pneumonia and Its Treatment. von Denk.—p. 2452.

Exclusion Gastrectomy in Terebrant Duodenal Ulcer.—F
sterer again advocates his method of exclusion gastrectomy, f
described in 1918, for the treatment of terebrant duodenal ul
i. e., for an ulcer penetrating in the proximity of the duod
papilla, or penetrating the pancreas over the hepatoduod
ligament. The ulcer is left untouched, while the antrum is
tioned at about three fingerbreadths from the pylorus. A
the excision of the mucosa; closure is performed by suture. F
lowing resection of two-thirds of the stomach an end-to-
anastomosis is performed with the first jejunal loop accor
to the Finsterer-Hofmeister technique. This method has a do
purpose: it reduces the mortality rate of surgical treatmen
duodenal ulcer and it prevents complications that are likel
occur when excision of a terebrant duodenal ulcer is attemp
While death resulted in 20 of 615 cases of duodenal ulce
which surgical treatment was instituted during the period
to 1930, only 9 of 644 patients died who submitted to sur
intervention for duodenal ulcer during the period 1930 to 1
The author attributes this improvement in the mortality ra
exclusion gastrectomy and states that in a more recent s
of 250 patients with duodenal ulcer operated on by Plenk
Zeihmann, death occurred in only 3 (a mortality rate of 1.
He urges digital exploration of the extent of the ulcer follo
gastrostomy, and recommends exclusion gastrectomy in
of large ulcers, in which closure of the duodenum accordin
Bsteh's technique may not be feasible. He emphasizes that
frequent occurrence of considerable dilatation of the ston
involving nearly exclusively the antrum requires the remova
two-thirds to four-fifths, so that only the normal cardiac
remains. He advises against adding an enteroanastomosis to
end-to-side anastomosis between the stomach stump and
jejunum, because it might favor the occurrence of a jejunal pe
ulcer. Although exclusion gastrectomy with preservation of
pylorus represents a method of treatment only for excepti
cases of duodenal ulcer, it makes possible the definite elim
tion of the risks associated with complications such as perf
tion of the common bile duct at the floor of the ulcer
perforation of Santorini's duct.

Endocrine Disturbances in Cirrhosis.—Of 18 male patients
cirrhosis of the liver reported on by the authors in 1938, all
a female type of distribution of the pubic hair that is to
considered as a definite clinical sign of testicular insufficie
The present paper is a report of 11 additional male pati
between the ages of 32 and 68 with cirrhosis of the liver, al
whom again presented the female type of pubic hair. Gyn

nastia was present in only one patient. Determination of androgen and estrogen excretion in a 24 hour collection of the urine of these patients showed that in 10 of them the androgen excretion was between 9 and 10.5 mg., i. e., about the same as that observed in normal women. On the contrary, the estrogen excretion was either near to normal or slightly increased, and occasionally pronouncedly increased. The female distribution of the pubic hair in these cirrhotic patients is, therefore, the morphological manifestation of the reduced androgen-estrogen ratio. This clinical sign was observed constantly, and it also appeared simultaneously with the occurrence of the hepatic lesions or shortly thereafter. It may be an aid in differential diagnosis between fatty liver and hypertrophic cirrhosis in alcoholics. This sign also permits unification of all types of cirrhosis of the liver occurring in male patients in one and the same syndrome, i. e., in the hepatotesticular syndrome, which may be ranked with the general syndrome of adaptation described by Selye. Etiologically, the cirrhoses do not form an unequivocal group, since they may be infectious, toxic, endocrine, cardiac, pulmonary, splenic, or cryptogenetic, but an identical pathogenesis may be considered in all cases. Sensitization of the organism by an exogenic factor that produces the hepatic lesion must be assumed, because the hepatic cells as well as the hepatic mesenchyma are very sensitive to all types of attack. But this sensitization alone is not sufficient. The cirrhogenic process is elicited secondarily by the neuroendocrine system, through (1) excessive secretion of corticoids, (2) inhibition of secretion of testicular or adrenal androgens as a result of diminution of gonadotropic hormones, and (3) increase in estrogens, all of which aggravate the initial hepatic lesion. It is suggested that male patients with cirrhosis of the liver receive treatment with male hormone in addition to the classic treatment consisting in a high protein and carbohydrate and low fat diet, and in administration of sulfurated amino acids, lipotropic factors, and vitamin B, C, D, and E. The male hormone plays by itself an important part in the protein anabolism and thus not only in nutrition but also in cell and skin respiration, by favoring the metabolism of sulfur and of sulfurated amino acids.

Pott's Disease. C. J. Kaplan.—p. 517.
Carcinoma of Cervix: Treatment with Radio-Active Cobalt^{60}: Use of Ring Applicators. J. Wakley.—p. 523.
The Newer Antibiotics with Special Reference to Chloromycetin. J. S. White.—p. 526.

Radioactive Cobalt for Carcinoma of Cervix.—Comparing the physical properties of radium and radioactive cobalt, Wakley shows that radioactive cobalt has certain advantages over radium as a source of gamma rays for the treatment of cervical cancer. He describes the design, construction and loading of a radioactive cobalt ring applicator for use in treatment of carcinoma of the cervix. A radioactive cobalt wire is incorporated in the applicator. The measurement of the dose rate was carried out by direct calibration against a known quantity of radium.

Ugeskrift for Laeger, Copenhagen

113:957-982 (July 19) 1951. Partial Index

*Bronchiectases: Twenty-Seven Cases, 18 Treated Operatively. C. E. P. Buus and K. Røjel.—p. 957.
*Cancer of Biliary Tract: Possibility of Early Diagnosis and Radical Surgical Treatment. E. H. Larsen, H. Brocks and A. P. Gammelgaard. —p. 961.
Lesions Due to Motor-Cycle Accidents. O. Kapel.—p. 968.

Surgery in Bronchiectasis.—Buus and Røjel state that the results to date in their cases testify to the value of surgical treatment of bronchiectasis. The duration of the affection from the start of the specific bronchiectatic symptoms or after roentgenologic diagnosis to the time of admission averaged 46 weeks in the 18 patients operated on, 28 months in the 9 treated conservatively. In the first group, on follow-up after an average of 31 months, 1 patient was not traced, 1 was dead from an intra-abdominal disorder, 10 were well, 3 were definitely improved and able to work, 2 were almost completely recovered from the pulmonary symptoms but not fully able to work, and only 1 patient showed signs of progression of the bronchiectatic process in spite of operation. On follow-up of the nine patients not operated on, after an average of two years, one patient was not traced, two patients were dead from the pulmonary affection, and six were in unfavorable condition.

Early Diagnosis and Radical Surgical Treatment in Cancer of Biliary Tract.—Larsen and his associates report on 44 cases in 19 men and 25 women, 42 of tumors of the biliary tract, 26 of which originated in the papilla of Vater, and 2 of duodenal tumor macroscopically not distinguishable from tumors originating from the duodenal papilla. The most frequent initial symptom was jaundice, sometimes intermittent, which was followed by gastrointestinal symptoms, pain, fatigue, and anorexia; later there was jaundice in almost all cases. Enlarged gallbladder (Courvoisier's law) was found in 38% of the cases on external palpation, in 80% at operation. Roentgen examination may be useful in tumors of Vater's papilla. As a rule, definite clinical diagnosis is not possible. The most important method of examination in case of possible tumor in the pancreoduodenal region is exploratory laparotomy. Palliative operation does not prolong life. Probably about 46% of the tumors of Vater's papilla in this material and 38% of those of other parts of the biliary tract were operable on the first admission.

113:1009-1034 (Aug. 2) 1951. Partial Index

*Congenital Fibrocystic Disease of Pancreas: I. Review. P. Bastrup-Madsen and O. Mortensen.—p. 1009.
*Id.: II. Report on 12 Cases. P. Bastrup-Madsen and O. Mortensen. —p. 1014.
Establishment of Trypsin in Feces by Gelatin Film Test. O. Mortensen. —p. 1017.
Artificial Feeding of Children in Arctic Regions. P. H. D. Waagstein. —p. 1020.

Congenital Fibrocystic Disease of Pancreas.—Bastrup-Madsen and Mortensen state that congenital fibrocystic disease of the pancreas, a hereditary anomaly of development, occurs predominantly in infants, about equally often in the two sexes. Pulmonary symptoms are prominent. Diagnosis can often be made on the basis of the history and ordinary clinical examination. Examination of the duodenal secretion will reveal the inability of the pancreas to excrete enzymes, but collection of the secretion is often difficult or impossible in children. Examination of the proteolytic activity of the feces may be useful. Roentgen examination can support the diagnosis but is not decisive. The earliest recognizable manifestation of the disorder is meconium ileus in the newborn infant, which is treated operatively. The fully developed picture of the disorder, marked by failure to gain weight, foul, bulky, and fatty stools, constant cough, and recurring pulmonary infection, is usually seen in the first half year of life. The characteristic lesions are cystic fibrosis of the pancreas and bronchiectasis. Treatment is symptomatic. The pulmonary infection is as a rule the immediate cause of death, which occurs oftenest in the first year of life. The prognosis may not be so unfavorable as it seems today, as probably only the gravest and most typical cases are recognized. The disease is most readily confused with celiac disease, which, however, rarely occurs till toward the end of the first year of life and is not as a rule accompanied by pulmonary changes.

Congenital Fibrocystic Disease of Pancreas.—Of the 12 patients with fibrocystic disease of the pancreas treated from 1943 to 1951, in the Pediatric Division of Aarhus Municipal Hospital, 11 were children less than a year old, 1 was a child aged 3. In eight cases, diagnosis was confirmed at necropsy, in two it was supported by demonstration of defective proteolytic activity of the feces (film test), and in two the diagnosis was probable. The characteristic findings were failure to gain weight, fatty, foul, and bulky feces, and symptoms from the respiratory tract, with periodic fever. In four cases there was evidence of familial occurrence. Most of the children were treated with antibiotics. The average length of life after diagnosis was two months. Only one child, treated with aureomycin, was still living four months after discharge. The effect of penicillin seems doubtful, but treatment with aureomycin in two cases gave marked improvement.

BOOK REVIEWS

Frontal Lobotomy and Affective Behavior: A Neurophysiological Analysis. By John F. Fulton, M.D., Sterling Professor of Physiology, Yale University, New Haven, Conn. Cloth. $3. Pp. 159, with 21 illustrations. W. W. Norton & Company,, Inc., 101 Fifth Ave., New York 3, 1951.

This brief monograph represents the Thomas W. Salmon memorial lectures delivered by Dr. Fulton before the New York Academy of Medicine. The first chapter concerns the historical aspects of the relationship of the brain, particularly the frontal lobes, to animal behavior. The second chapter deals with the relation of the brain, particularly the hypothalamus and the cerebral cortex, to autonomic functions (principally visceral and vasomotor activities). Chapter 3 discusses the effect on behavior of ablation of various parts of the animal brain, while the fourth and last chapter concerns the results of frontal lobotomy in man.

This is an interesting little book and will prove valuable to many who are not too familiar with frontal lobotomy and its anatomic and physiological background. It is, however, somewhat superficial in its treatment of the subject and suffers from the fact that its author has had little first-hand experience with patients who have been treated in this manner. For this reason, he is dependent on the formal statements made in the literature regarding various observers' personal opinions and viewpoints. These do not always give a complete picture.

Clinical neurology and psychiatry are deeply indebted to Dr. Fulton, who has done more than almost anyone else to popularize the basic sciences of neuroanatomy and neurophysiology and to show the clinician their correlations with his clinical problems. He has done that again here. It may be the secret of Dr. Fulton's success that he has simplified his presentations and has not confused his clinical readers with experimental complexities and details beyond their knowledge and experience.

A Textbook of Medical Conditions for Physiotherapists. By Joan E. Cash, B.A., M.C.S.P. With foreword by Frank D. Howitt, C.V.O., M.A., M.D. Cloth. $5. Pp. 350, with illustrations. J. B. Lippincott Company, 227-231 S. 6th St., Philadelphia 5; Aldine House, 10-13 Bedford St., Lon- on, W.C.2; 2083 Guy St., Montreal, 1951.

author is a physical therapist who has attempted to write textbook for others in her profession describing the medical and neurological conditions encountered by physical therapists. The first section is devoted to a discussion of basic pathological changes. The other seven parts of the book are devoted to classifications and descriptions of diseases affecting the various systems of the body. In many instances the classifications used are oversimplified and not generally accepted. Certainly the discussions of the pathology involved should have been written by a pathologist. The applications of physical medicine to the various conditions described are presented briefly and in general terms. The few illustrations that are used are well selected. The plates have been well reproduced, and diagrams are clearly presented.

The material is not sufficiently covered to be a useful reference or textbook for student physical therapists. It is of no value for physicians in general or those specializing in physical medicine and rehabilitation.

Management of Celiac Disease. By Sidney Valentine Haas, M.D., Professor of Pediatrics and Director of the Department, New York Polyclinic Medical School and Hospital, New York, and Merrill Patterson Haas, M.D. Cloth. $5. Pp. 188,, with 12 illustrations. J. B. Lippincott Company, 227-231 S. Sixth St., Philadelphia 5; Aldine House, 10-13 Bedford St., London, W.C.2; 2083 Guy St., Montreal, 1951.

This monograph on celiac disease is the culmination of 25 years of clinical experience, research investigation, and digest of the medical literature by the senior author, prepared in collaboration with his son. Over half of the book is devoted to presentation of the many conflicting viewpoints advanced in explanation of this poorly understood disease since its first description in modern literature, 63 years ago. The literary review is done in a very orderly fashion and serves to develop a clear-
picture of the disease and the accumulated scientific facts a
opinions relating to it. An extensive bibliography is append
The authors then give their own experience with 370 cases whi
were carefully followed, tabulating various effects obser
after instituting treatment. The therapy found entirely satisf
tory and recommended here is strict dietary control, accordi
to carefully proved regimen over an extended period of tin
Finally, the authors discuss their etiologic hypothesis for t
perplexing disease, based on observed clinical facts as yet
supported by experimental data.

This book has concisely presented information of value
the practicing physician for the successful treatment of ce
disease, with an abundance of bibliographic references of in
est to all investigators in this and related disease fields.

**Atlas der pathologischen Anatomie: Eine Sammlung typischer Kr
heitsbilder der menschlichen Organe.** Von Dr.med., Dr.med. vet.
Robert Rössle und Dr.med Kurt Apitz. Cloth. 87 marks. Pp. 298,
564 illustrations. Georg Thieme, Diemershaldenstrasse 47, (14a) Stutt
O; agents for U. S. A., Grune & Stratton, Inc., 381 Fourth Ave.,
York 16, 1951.

This atlas is a welcome addition to the textbooks of pa
logic anatomy. It presents separate chapters dealing with
various organs except for skin, eye, and ear. The illustrati
for the most part colored, are accompanied by pertinent
scriptions and short, stimulating clinical allusions. The boo
designed not only as an introduction for the student but
as an instruction for any physician who begins to specializ
learning to view pathological changes and to describe accura
the findings. The value of this book, written by the present ne
of the German school of pathology, lies in the beautiful c
photographs, the brilliancy and clearness of which are sup
The reader gets the impression of dealing with actual mat
from the autopsy table. The specimens are impartially sele
and typical of the commoner diseases.

Of course, as would be true of any newly published atla
this type, later editions are likely to carry replacements for
few black and white photographs and to contain some n
uniformly characteristic colored pictures.

This rather inexpensive book is of great value even f
student not familiar with the German language, for the pict
speak for themselves.

Clinical Laboratory Methods. By W. E. Bray, B.A., M.D., *Professo*
Clinical Pathology, University of Virginia, Charlottesville. Fourth edit
Cloth. $7.25. Pp. 614, with 137 illustrations. C. V. Mosby Company,
Washington Blvd., St. Louis 3, *1951*.

This book covers a wide variety of clinical tests, inclu
many developed recently. The contents are gathered under
following chapters: general rules and examinations of valu
various cases, urinalysis, hematology, blood chemistry, gas
analysis, feces and intestinal parasites, puncture fluid and c
brospinal fluid examination, sputum, bacteriology, mycol
water and milk examinations, serology, basal metabolism te
allergy tests, poisons and foreign substances, surgical pathol
indicators, stains and removal of stains.

Spot checking of the directions for performing the tests
revealed several defects. In places the directions are incomp
and ambiguous, e. g., in the directions for storage of u
pending laboratory examination for ascorbic acid. In some
stances inexact and indefinite measurements are fostered
failure to specify container size and the use of such units
measure as "fingerbreadth." Examples of antiquated and inc
sistent terminology are exemplified in the ascorbic acid tolera
test, where the obsolete term cevitamic acid is predominan
used. In the test for ascorbic acid in blood, the terms vitamin
cevitamic acid, and ascorbic acid are all used in five short pa
graphs. Ascorbic acid does not appear in the index. Instead
referring to standard reagents available from such agencies
the U. S. Pharmacopeia, commercial products are suggested
reference standards.

The reviews here published have been prepared by competent authorities and do not represent the opinions of any official bodies unless specifically stated.

The illustrations are numerous and clear; there are directions for making up the reagents required; tables of equivalents, atomic weights, and normal values in healthy subjects are collected toward the end of the work; and the index seems adequate.

Causalgia. By Frank H. Mayfield, M.D., Assistant Professor of Clinical Surgery, College of Medicine, University of Cincinnati, Cincinnati. Publication number 58, American Lecture Series, monograph in American Lectures in Neurosurgery. Edited by Michael E. DeBakey, M.D., Professor of Surgery and Head of Department of Surgery, Baylor University College of Medicine, Houston, Texas, and R. Glen Spurling, M.D., Clinical Professor of Surgery, University of Louisville, Louisville, Kentucky. Neurosurgical Division. Editor, Barnes Woodhall, M.D., Professor of Neurosurgery, Duke Hospital and School of Medicine, Durham, North Carolina. Cloth. $2.25. Pp. 65, with 12 illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 49 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, 1951.

This small monograph deals with the subject clearly, concisely, and intelligently. The study is based on 105 cases of true causalgia seen in military service and treated by sympathectomy, plus a lesser untabulated number treated in civilian practice. The author emphasizes the opinion that causalgia is a clinical entity characterized by pain which is usually burning, and is associated with vasomotor and trophic changes; this entity follows injury to peripheral nerves. It occurs most frequently with injury to the median and sciatic nerves; however, other nerves may be involved. The probable mechanism is thought to be an interaction of impulses between sympathetic and sensory fibers at the site of injury.

The author is of the opinion that the pain can be relieved by appropriate sympathectomy. Procaine block of the sympathetic chain is a valuable diagnostic aid and may also be an effective therapeutic agent. Illustrations are added which show the commoner technics for procaine block and sympathectomy. The book is readable and the material is presented in refreshing style.

Micro-Arteriography and Other Radiological Techniques Employed in Biological Research. By Alfred E. Barclay, O.B.E., M.D., D.Sc. Cloth. $6.75. Pp. 102, with 46 illustrations. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 49 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, 1951.

This book is an account of Barclay's work at the Nuffield Institute of Medical Research, Oxford, in which he adapts and develops radiological techniques for use in the experimental laboratory. Particular attention is given, in an autobiographical nature, to the development of micro-arteriography. This book will be read with great interest by investigators interested in laboratory techniques intended for visualization of the vascular system.

The illustrations are deserving of a special commendation. These illustrations alone, showing micro-arteriographs of sections of a rabbit's kidney, the mucous membrane of the stomach, an arteriogram of the arterial supply of the testes of the Danna Wallaby, and others, should be of particular interest to the anatomist and physiologist. Because of the highly specialized nature of the techniques developed, this book will be utilized and appreciated mostly by those investigators concerned with visualizing the vascular system.

Atlas of Cross Section Anatomy of the Brain: Guide to the Study of Morphology and Fiber Tracts of the Human Brain. Fifth section of Emil Villiger's Brain and Spinal Cord, fourteenth edition revised by Eugen Ludwig, Professor of Anatomy, University of Basel. Atlas further revised by A. T. Rasmussen, Professor of Anatomy, University of Minnesota, Minneapolis. Cloth, loose-leaf. $5. With 63 plates. Blakiston Company (division of Doubleday & Company, Inc.), 1012 Walnut St., Philadelphia 5, 1951.

For many years medical students and others interested in studying the fiber pathways of the brain have turned to Villiger for reliable and well presented information. This is a reprint of that classic atlas. It is well done. In addition, Dr. Rasmussen has added 11 sagittal sections of the brain, which he has prepared from his own collection. This is a valuable addition to the cross-sections of the original work. Dr. Rasmussen has done much to aid the teaching of neuroanatomy as well as to instruct many students in this field personally. This is another of his worth-while contributions to the subject.

Medicinal Chemistry: Chemistry, Biochemistry, Therapeutic and Pharmacological Action of Natural and Synthetic Drugs. By Alfred Burger, Associate Professor of Chemistry, University of Virginia, Charlottesville. Volume I. Cloth. $10. Pp. 577. Interscience Publishers, Inc., 250 Fifth Ave., New York 1; Interscience Publishers, Ltd., 2a Southampton Row, London, W.C.1, 1951.

Chemists have for many years determined the structures of naturally occurring medicinals, synthesized compounds for possible use as drugs, and speculated on the relations between chemical structure and pharmacologic activity and on the exact mechanisms of the actions of drugs in the body. It is only recently, however, that medicinal chemistry has achieved status as a separate branch of chemistry.

Now that medicinal chemistry is recognized and medicinal chemists have a place on the research teams that develop, test, and put into production new pharmaceuticals, there is a demand for courses in the subject. Dr. Burger's is one of the first textbooks for such a course. Like any pioneer, Dr. Burger has had to collect and condense a vast amount of scattered material. The extent of his task is indicated by the number of references cited, even though he has not attempted to be complete. It is, therefore, not surprising that the work seems to be uneven. In the body, where he deals with classes of drugs—general and local anesthetics, hypnotics and sedatives, anticonvulsant drugs, analgetics, analeptics, cardiovascular drugs, parenteral fluid therapy, diuretics, anticoagulants, drugs affecting the gastrointestinal tract, expectorants, adrenergic drugs, adrenergic blocking agents, parasympathetic stimulants, curare and curariform drugs, antispasmodics, histamine and antihistaminic drugs, diagnostic agents, thyroxine and antithyroid drugs, drugs for the treatment of cancer and the vitamins—the work is clear and interesting. In the introductory chapters—on the relationships of biological activity to chemical structure and physical properties, the biological study of drugs, and the restricted response of cells to drugs—the work often is involved, unclear, and out-of-date.

Special mention should be made of the interesting chapter dealing with the history of medicinal chemistry, which contains a long chronological table, starting with 1850, summarizing chief developments. Complete structural formulas are used wherever required throughout the text. Generic and full chemical names are employed in the body of the work; however, in the index, trade names of drugs also are included and are distinguished from generic names by the use of ®. Three introductory pages tell the difficulties arising from the present confused state of drug nomenclature.

The text has faults in organization, grammar and logic, as well as a few "printer's errors." However, these should not greatly handicap the student already well grounded in biological sciences and chemistry. The printing and binding are good.

Chronology of Ophthalmic Development: An Outline Summary of the Anatomical and Functional Development of the Visual Mechanism Before and After Birth. By Arthur H. Keeney. Publication number 99, American Lecture Series, monograph in American Lectures in Surgery. Edited by Michael E. DeBakey, M.D., Professor of Surgery and Chairman, Department of Surgery, College of Medicine, Baylor University, Houston, Texas, and R. Glen Spurling, M.D., Clinical Professor of Surgery, University of Louisville, Louisville, Kentucky. Ophthalmology Division. Editor, Donald J. Lyle, M.D., F.A.C.S., Professor of Ophthalmology, College of Medicine, University of Cincinnati, Cincinnati. Paper. $2. Pp. 22, with 3 charts. Charles C Thomas, Publisher, 301-327 E. Lawrence Ave., Springfield, Ill.; Blackwell Scientific Publications, Ltd., 49 Broad St., Oxford, England; Ryerson Press, 299 Queen St., W., Toronto 2B, 1951.

This small paper-covered booklet is issued as publication no. 99 of the American Lecture Series, with Dr. Donald J. Lyle serving as editor for the ophthalmology division. The text is limited to a few pages of introduction and a listing of the functional development of vision and binocularity from the third fetal month to the ninth year of life. The major contribution of this publication lies in the three large tables showing the development of various portions of the eye and orbit during prenatal and postnatal life, making possible a correlation between the development of the various parts at any given period.

The author does not claim to have added much that is new, but he has succeeded in placing this embryological and developmental material in a conveniently accessible form. To one with some knowledge of ocular embryology, it is a publication of value for reference and review.

QUERIES AND MINOR NOTES

TRAINING TABLE DIETS AND SWIMMING

To the Editor:—*Please discuss athletic training table diets for both aquatic and land sports, giving specific suggestions for the meal immediately preceding an athletic event. Also give me information on the difference between muscular training in aquatic sports and that in land sports. Some swimming coaches eschew intensive "dry" exercise because it "tightens the muscles."* *M.D., Michigan.*

Answer.—"The Trainer's Bible," by Dr. S. E. Billik (New York, T. J. Reed and Company, 1946), is one of the few books on athletic training prepared by a medical writer. It contains a chapter on "Diet in Athletics."

In general the best diet for the athlete is the same good diet as that recommended for any person of like age with a similar work output. There is a dearth of scientific information relative to the kind of meal most desirable immediately preceding an athletic event. Available evidence appears to indicate that severe exercise in itself has little effect on digestion but that the strong emotions connected with competition in even the milder types of sports may upset digestion and impede high-level performance. Consequently coaches prefer that their athletes eat two to three hours prior to game time, the meal consisting of easily digested foods that at the same time will furnish the energy necessary for strenuous physical activity. A typical pregame menu might include lean meat or eggs, baked potato or toast, milk, tea, coffee, or cocoa, and fully ripe fresh fruits. Since the passage of food through the gastrointestinal tract generally takes more than 24 hours, it is considered desirable to omit foods containing large amounts of roughage, such as fibrous vegetables, from the diet during this period. Individual preference for and eaction to various types of foods are most important, and the ods one is accustomed to must be taken into account. As a eral rule the high-strung, sensitive type of athlete will be ppiest with a lighter meal eaten longer in advance of a contest than will his less emotional teammate. There is, as far as known, no reason to recommend differentiation of these principles for land and aquatic sports.

Swimming coaches place great emphasis on relaxation. The ability to attain a completely relaxed style has been labeled by some successful coaches as the key to good swimming. Consequently there has been a feeling that, while stretching exercises, especially during the early training season, can be helpful, any exercises requiring muscles to maintain fixation in a shortened state under tension for prolonged periods would be contraindicated during the competitive season. In general, training for one skill makes little contribution to performance in a different skill. There are differences in speed, force, and pattern of movements with each skill demanding varying neuromuscular discriminations and organic adjustments. Training for one sport and even for events or positions of that sport are specific to the sport and its events or playing positions. For this reason the best training for swimming is swimming and the best training for its events is training for particular distances and kinds of strokes. While swimming does not demand great strength, a high degree of strength will allow the use of less musculature for each stroke and permit the swimmer to maintain a higher speed over a longer time. Therefore, heavy developmental exercises out-of-season have been found useful in bettering swimming performance. However, the use of such activities to improve strength and endurance should be confined to periods between competitive seasons.

PREGNANCY AFTER FIRST ACT OF INTERCOURS

To the Editor:—*What is the possibility of a girl's becomi pregnant the first time she has intercourse? Do most girls fi this first experience painful even though the hymen has be broken in an instance other than intercourse? What are t possibilities of a girl's becoming pregnant the 21st day follo ing the first day of her last menstruation?* *M.D., Nebraska.*

Answer.—A girl may become pregnant the first time she h intercourse if she has ovulated recently or if she ovulates so after intercourse and if the coital partner is fertile. Most girls not find the experience painful if the hymen has been ruptur and stretched adequately to admit the penis. This, of cour brings up many problems. Psychic elements may cause the to experience pain, especially if the experience is against her w

Ovulation probably may occur at any time in the cycle certain occasions and it possibly may occur with intercourse in the rabbit) but the best proof available today would indic that ovulation more frequently occurs about 14 days bef the expected menstrual period and that this concept is m accurate than any method of determining ovulation followin period. In other words, the menstrual period per se does cause ovulation but ovulation causes menstruation in about days unless pregnancy supervenes.

In a series of patients operated on by Dr. John Brewer, ov tion was found to occur at most any time in the cycle, bu was uncommon both early and late; as the midportion of cycle was reached, ovulation was found to have occurred larger numbers; the peak was reached in the midportion o 28-day cycle, or 14 days prior to menstruation.

The age of the patient was not stated. It is believed that m girls do not ovulate for a year or two after the onset of so-cal menstruation but that the periods are a form of anovulat bleeding which may last a short or long period until regu ovulation occurs, leading to a regular menstrual cycle.

A woman could become pregnant on the 21st day follow her last period if her cycle were 35 days—in other words, would be the 14th day before the expected period—or ovulat could have occurred on the 21st day of a regular cycle. exact statement is difficult to make, because, if pregnancy occ one never knows when the period would have occurred.

HYSTERECTOMY

To the Editor:—*A woman, 50, was operated on for bleed fibroids. The surgeon did a total hysterectomy. The cervix the ovaries were normal. Is the cervix important for the s port of the pelvic floor? Would it not be more proper to m a subtotal hysterectomy and not remove the ovaries?*

M.D., New York

Answer.—There is disagreement on both of these subje The vaginal total hysterectomy without plastic procedures a the total abdominal hysterectomy are considered by some safest procedures with respect to morbidity and mortality. T supracervical or subtotal operation is attended with the high morbidity, because in this operation one cuts across the cerv an organ frequently harboring infection. One practically nev sees a normal cervix even in a virgin; most of them show e dence of endocervicitis on microscopic section. The cervix is no importance in the support of the pelvic floor and neither a the round ligaments. The cardinal and uterosacral ligamen are apparently important in the support of the pelvic floor.

One does not usually leave the cervix in a vaginal hyst ectomy, so that there would seem to be no reason for leavi it in when removing the uterus from above. Much of this d agreement arises from failure to evaluate the amount of relax tion before surgery. This can easily be done by having the patie

The answers here published have been prepared by competent authorities. They do not, however, represent the opinions of any official bodies unless specifically stated in the reply. Anonymous communications and queries on postal cards cannot be answered. Every letter must contain the writer's name and address, but these will be omitted on request.

in down with a tenaculum pulling on the cervix. Often, if patient stands up and strains with the tenaculum pulling on cervix, considerable degrees of prolapse will be elicited. If ent, then plastic procedures can be employed to support the ic floor. Vaginal hysterectomy, combined with vaginal plastic edures, is commonly employed even with morcellation of tumors if necessary. Occasionally it is expedient to start the erectomy vaginally, amputate the cervix, complete the plas- procedure, and then remove the large tumor and fundus minally. Carcinoma of the cervical stump is one reason routinely removing the cervix.

areful questioning of patients subjected to complete hyster- my reveals that the cervix apparently plays no part in the yment of intercourse, nor is it necessary for lubrication. The ition of whether to remove the ovaries causes much argu- t. Many do not believe in removing the ovaries unless they diseased. Others believe in removing them after age 45. iaps a better rule would be to remove them only after the opause was over.

ERGY

THE EDITOR:—*Where can I get the best materials for testing itients for etiology of allergy. Since I am in general practice lease discuss relative values of one type of testing, e. g., tradermal, as against patch testing. What can be done when e allergic symptoms are activated by "colds"? Where can ne procure the most reliable type of material for specific esensitization, e. g., food desensitization?*

M.D., Pennsylvania.

NSWER.—1. Satisfactory extracts for allergy testing may be iined from several laboratories. Among these are Abbott ioratories, North Chicago, Ill.; Arlington Laboratories, ıkers, N. Y.; and Hollister-Stier Laboratories, Spokane, sh. 2. Patch testing is done only when contact dermatitis nvolved. For the atopic allergies (e. g., asthma, hay fever, atopic dermatitis) either scratch or intradermal testing is cated. Scratch tests are less painful, are quicker, show a ıer correlation with clinical findings, and are safer. Intra- nal tests are more sensitive and may thus enable one to e specific diagnoses when scratch tests fail; however, they dangerous, particularly in the hands of other than experts, should be preceded by scratch tests. For more detailed com- son of the two methods the reader is referred to a work by iberg (Allergy in Practice, ed. 2, Chicago, The Year Book lishers, Inc., 1946).

. It is presumed that the inquirer has in mind the procedure prevention of asthma following colds. In such cases, as soon cold is evident, small doses of ephedrine and iodides may ent the onset of severe asthma. A course of treatment with ccine made from the usual bacterial flora of the respiratory t may minimize the bacterial inflammation in the bronchi ndary to colds and may thus prevent asthma. When an rgic etiology is present (inhalant substances or foods), the ination of these agents frequently deprives the colds of their ma-producing tendencies. 4. The same source can supply acts to be used in desensitization and in diagnosis. Food de- sitization should not be done hypodermically, unless the food the form of a dust, such as flour, which is a cause of asthma akers. If desensitization to food is required, the oral method tilized, the patient ingesting small and gradually increasing ounts of the actual foods daily.

RTS OF THE TONGUE

THE EDITOR:—*I would like to know how much formaldehyde could use in honey for venereal warts of the tongue and nouth as a swab. I have tried aureomycin and penicillin with o results.* *Albert C. Lundgren, M.D., Minneapolis.*

NSWER.—Formaldehyde is used usually in concentrations 3% to 10% and should be used with great caution on an a such as the tongue. Lynch and Karon, who recently re- ted on a large experience with the use of formaldehyde oint- nt for warts (*Arch. Dermat. & Syph.* 62:803 [Dec.] 1950) ed that it should not be used for condylomas; they prefer lophyllum resin instead.

OXYGEN CONTENT OF ARTERIAL BLOOD

TO THE EDITOR:—*Has there been any improvement in apparatus and method for analyzing arterial blood for oxygen concentration? What would be the clinical symptoms of a 90, 85, 80, 75, 70, 65, and 60% concentration? Has any research been done with animals to determine how low the oxygen saturation would have to go to cause death? What drop in arterial blood oxygen would there be if a person held his breath for one minute? What would be the usual blood oxygen in a patient dying from anoxia? Would there be any drop in blood oxygen in extreme physical exhaustion?*

T. A. Taylor, M.D., Lufkin, Texas.

ANSWER.—1. The methods used for determining oxygen content of arterial blood are both direct and indirect. The Van Slyke and Neill method on drawn blood is still standard and, when properly executed, is accurate to ±0.1 vol. %. The recent Scholander micromodification is quicker and simpler and requires as little as 0.1 ml. of blood; it is sufficiently accurate for most purposes. Indirect determinations can be made on arterial blood in the intact ear by the use of the oximeter, a photoelectric device having an accuracy in the range of plus or minus 5 to 10%.

2. Clinical symptoms of normal subjects breathing low oxygen mixtures are essentially as follows, when related to arterial oxygen saturation: 90%—no symptoms (but there is impairment of night vision and the appearance of slow waves in the electroencephalogram; 85%—central nervous system symptoms of euphoria, impairment of judgment, sleepiness, headache, dizziness, personality changes resembling alcoholic intoxication, incoordination of finer muscular movements, shrinking visual fields, increase in heart rate and respiration, and beginning cyanosis; 80-70%—above symptoms and signs progressively exaggerated; and 65%—hyperventilation alkalosis, often with tetany or convulsions, collapse, and coma. A small proportion of persons would die after perhaps 30 minutes. These are average effects on normal persons during acute exposure. Slowly developing hypoxia brings into play processes of acclimatization, and clinical states involve variables that make effects relatively unpredictable.

3. Most animals withstand hypoxia better than man. In normal humans, under the above conditions and subject to the same qualifications, the lethal range of arterial oxygen saturation lies at about 50 to 65%.

4. Holding the breath for one minute or exercising to extreme physical exhaustion lowers arterial oxygen saturation to about 90%, which corresponds to an arterial oxygen content (assuming 15 gm. % hemoglobin) of about 18 vol. %.

MECHANICAL URTICARIA OR EDEMA

TO THE EDITOR:—*A male patient has a traumatic allergy. If he uses a hammer, his hands swell so that he cannot grasp the hammer. If a weight is placed on his shoulder, such as a carrying bar, the same swelling occurs. If he lies on his side to repair a piece of machinery, his thigh becomes swollen. Since he is a mechanic the condition is serious to him. What treatment can be given? He has been to one of the larger medical clinics, and they have advised work that is less traumatizing, but this is not feasible economically.* *M.D., Indiana.*

ANSWER.—The condition described is related to dermographism and to other types of physical hypersensitivity. It is doubtful that this is a true allergy, i. e., a specific antigen-antibody reaction. More likely it is an exaggerated expression of a normal phenomenon. If the trauma is intense enough (catching a fast-pitched baseball with the bare hand, or striking the skin with the old hickory rod) a swelling or welting will be produced. Some persons respond similarly to milder mechanical stimuli. The swellings in both instances are thought to be produced by increased capillary permeability and serous effusion due to release of histamine by the trauma. Antihistamines used prophylactically may be helpful. Vasoconstrictors, particularly ephedrine, may also help. It is possible that rutin or large doses of vitamin C might also be effective.

DIABETES IN CHILDHOOD

TO THE EDITOR:—*In April, 1951, a previously healthy 8½ year old boy had nocturnal enuresis of three weeks' duration. Urinalysis showed above 2% sugar and 1+ acetone. Blood sugar during the following two weeks ranged from 215 mg. per 100 cc. fasting to 400 mg. in the third hour of a glucose tolerance test. Blood sugar in the fourth hour of this test was 291 mg. The only other finding was moderate suppurative nasopharyngitis, requiring penicillin administration. Glycosuria was controlled with a 2,000 calorie diet containing about 200 gm. of carbohydrate, 65 gm. of protein, and 100 gm. of fat, with 30 units of protamine zinc insulin each morning. There has been minimal acidosis. During his post-hospital observation, he occasionally had symptoms of hyperinsulinism, with afternoon blood sugar level as low as 55 mg. The dose was steadily decreased to five units of protamine zinc insulin daily, with the same diet. An occasional blood sugar reading with, or without, this small insulin dosage in the subsequent weeks varied between 70 and 140 mg. The patient's weight has varied no more than 2 lb. (0.9 kg.) in the past six weeks, and has beeen around 68 lb. (30.8 kg.); his height is 50 in. (127 cm.). Does this rather wide fluctuation in the clinical picture represent a remission in true diabetes mellitus or are there known occurrences of transient pathology in the pancreas followed by complete restoration of function? There is no diabetic family history.*

L. Maxwell Lide, M.D., Florence, S. C.

ANSWER.—This child has diabetes, and diabetes as yet is not curable. Insulin is needed by every diabetic child. Frequently, if the case is diagnosed early and aggressively handled, children do especially well, so well that even those with long experience with diabetes are deceived. Umber noted years ago the good effects of *überinsulinierung*—overinsulinization—and Brush wrote about it, advising it, but unfortunately he has not published a subsequent paper. Repeatedly one is tempted to give up insulin. This should definitely not be done in a case like this. Insulin should be continued, even if only token dosage is used. The present diet, carbohydrate 200, protein 65, fat 100 gm., is good; the carbohydrate restriction should be continued for life, with protein and fat adjusted as necessary. It would be helpful to other physicians if the questioner would report this case in this section in six months.

PRURITUS ANI

TO THE EDITOR:—*A patient complains of pruritus ani, occurring several times a day. He has the sensation of wanting his bowels to move, but when he tries to have a bowel movement he is unsuccessful and the anal region becomes moist. This irritates him very much. Anal and rectal examination including a sigmoidoscopy is almost normal. I would appreciate suggestions.*

M.D., Texas.

ANSWER.—The sensation of "wanting his bowels to move" probably indicates the presence of feces in the rectum. The unsuccessful bowel movement may indicate muscle spasm. The leakage of mucus and pruritus ani are characteristic in many cases of fecal retention. However, in these cases there usually is a local pathological condition, such as cryptitis and papillomas. This condition may appear relatively minimal to the casual examiner. It is therefore important that a careful anal, rectal, and sigmoidoscopic examination be performed. Particular attention must be paid to the crypt area. Evidence of inflammatory change in the crypts would indicate the necessity for surgical intervention. Spasticity of the musculature, or pectenosis (a scar tissue band overlying the muscle and preventing proper relaxation) may be etiological factors.

It is impossible to advise therapy without adequate diagnostic study. However, if there is fecal retention, an instillation of mineral oil, about 3 oz. (90 cc.) before attempting defecation, will usually result in a successful, painless, non-irritating bowel movement. It is best not to take oil by mouth in these conditions. The oil leakage becomes a source of irritation. The oil instillation described may be given by an infant-type bulb syringe and a well-lubricated rectal catheter. The oil need not be retained, but may be immediately expelled.

The perianal area must be kept continuously dry and After each bowel movement it should be washed with water and a bland, non-perfumed soap. It should then be or washed with cold water and patted dry. Toilet tissue never be used. The area should then be powdered with starch powder and such powder and a powder puff carried during the day for repeated application. All local patho lesions should be removed concurrently with the above ment. If response to this therapy is inadequate, consultation a proctologist should be sought.

CONGENITAL ARTERIOVENOUS FISTULAS

TO THE EDITOR:—*A 39 year old woman has a cong aneurysm involving the vaginal and middle hemorr branches of the right hypogastric artery. The aneurysm about 3 in. in its largest diameter, and a strong pulsation felt through vaginal and rectal walls. I should apprecia formation about case reports on surgical removal of a h gastric (or internal iliac) aneurysm.*

Arthur J. Lesser, M.D., Los Ange

ANSWER.—Congenital arteriovenous fistulas may occu any location, but a report of this condition at the site ment has not been found. It has been known to follow prol labor, in which case it would be of traumatic origin like arteriovenous aneurysms. It is possible that this condi as a hemangioma and progressed to a type of arteriov aneurysm with multiple communications. If such is the ca excision might well be extremely hazardous or even In any event, excision should be attempted only after temp occlusion of both hypogastric (internal iliac) arteries.

CAUSE OF BARTHOLINITIS

TO THE EDITOR:—*I have seen several cases of bartholin single women aged 40 to 45. Some physicians say th disorder does not occur in single women. Textbooks sta it is gonorrheal in origin in 75% of cases. Please clari present attitude of gynecologists on the cause of this tion. Do they believe it occurs in single women o morals?*

M.D., Ill

ANSWER.—Almost all gynecologists are agreed that th mon infecting organism in bartholinitis is the Gonococc that a small proportion of cases is due to other organism as the Staphylococcus, diphtheroid organisms, Bacillus c and, though rather rarely, such parasites as Trichomonas alis. Statistics on the incidence of the various groups do no to be available, but it seems that the gonorrheal group up more than 75%. Gonorrheal bartholinitis can certainly in single women, since the gonococcus is no respecter of marriage vows, and other infectious organisms may be in either the married or the single, even those of good

SENSITIVITY TO IODINE

TO THE EDITOR:—*A patient has a dermatologic iodine tivity, sufficiently severe so that use of an iodized prick powder once caused severe dermatitis. There are clini dications for cholecystography. The result of a conju test with iodopyracet (diodrast®) is negative. Please ad to the dangers of reaction if oral cholecystography formed with iodoalphionic acid.*

M.D., Virg

ANSWER.—Reactions due to hypersensitivity to iodine, usually mild, may sometimes be very severe. In fact, ther been a few fatal reactions recorded. The administration of in this case, even though the result of the conjunctival negative, would be hazardous and open to criticism.

CORRECTION

Chlorophyll and Chlorophyllin.—In the query and answ titled "Chlorophyll" published in THE JOURNAL, Septem page 99, the term "chlorophyllin" should have been used i of "chlorophyll." Chlorophyll as it naturally exists in pl an oil-soluble substance, relatively unassimilable in the al tary tract. Chlorophyllin is a water-soluble salt of chloro

ANAGEMENT OF OCCLUSIVE ARTERIAL DISEASES OF THE EXTREMITIES

Fay LeFevre, M.D., Cleveland

Arteriosclerosis obliterans and thromboangiitis oblit- ns are the two most important occlusive peripheral scular diseases. The former occurs predominantly in e older age group of either sex, and the course of the sease is accelerated by the coexistence of diabetes mel- us. The latter occurs almost exclusively in young men. e end result of both diseases can be total disability. is, in part, may be modified by early recognition and reful management. Although arteriosclerosis obliterans d thromboangiitis obliterans differ pathologically, the sulting symptoms and signs are caused by arterial in- fficiency. Certain phases of treatment, therefore, apply both diseases. It was recognized many years ago that tients with occlusive arterial peripheral vascular dis- se should be instructed to (1) avoid trauma; (2) avoid posure to cold; and (3) avoid tobacco. These are basic inciples that apply to the treatment of both diseases any phase. It is convenient to consider treatment in ree categories.

PHYSICAL MEDICAL MEASURES

The application of local heat to the extremities is a ysical medical procedure which deserves careful evalu- ion. Excessive heat on the extremities increases the etabolic demand for a greater blood flow, and rapidly pletes the available tissue nourishment. In the presence arterial insufficiency the increased demand caused by e excessive heat cannot be supplied. Ischemia and the ndency toward gangrene therefore are increased. When irect heat is applied locally to a limb with decreased terial circulation, no type of high-temperature heating pparatus should be used. These include short wave dia- ermy, electric bulbs, and infrared heat, as well as hot- ater bottles and hot foot soaks of medicated or non- edicated solutions. Heat may be applied safely to a mb only by means of one of the accepted thermostat adles. The temperature should never exceed 95 F.

A helpful means of determining the safety of direct eat is the caudal or lumbar parasympathetic nerve block. If a rise in temperature of 4 F or more following the block is noted, controlled heat is probably safe and may be comforting. If there is no temperature elevation following the block, the use of heat would undoubtedly be painful and frequently injurious. In contrast to direct heat, the application of reflex heat is a safe method and may be beneficial in the treatment of patients with occlusive arterial disease. This may be applied by means of the sitz bath or use of a heating pad or heat cradle over the abdominal and lumbar regions. Short wave diathermy may be applied safely when used reflexly. The electric blanket has some merit, especially in the treatment of patients who have night cramps of vascular origin. It has been my and my colleagues clinical experience that heat is not an effective therapeutic agent when applied directly to a limb with reduced arterial circulation. My colleagues and I use a well-constructed cradle, free from side braces, over the foot of the bed. This is covered with blankets, and the legs are encased in full-length loose-fitting stockings. Lamb's wool applied around the limbs as suggested by Samuels [1] is also an effective way of retaining warmth. If possible the room temperature should be 80 F or above. This method can be carried out safely either in the home or the hospital.

Some patients with severe arterial insufficiency are relieved of their pain by the application of cold. In these patients gangrene usually develops, and they require surgical intervention regardless of treatment. Use of cold as a preoperative form of relief is beneficial but should not be employed with the expectation of saving the limb.

Vascular exercises as suggested by Buerger and Allen have been employed by many physicians as a routine form of vascular therapy. The value of these exercises has never been determined physiologically, and E. V. Allen [2] doubts their importance. Wilkins [3] and associates recently have reported evidence which indicates that the standard exercises may not only be valueless but actually harmful. They investigated the effect of the dependent position on blood flow in the limbs. By means

[3] Wilkins, R. W.; Halperin, M. H., and Litter, J.: The Effect of the Dependent Position upon Blood Flow in the Limbs, Circulation 2: 373 (Sept.) 1950

of determining the arteriovenous oxygen differences based on the Fick principle, they were able to determine variations in peripheral blood flow in relation to position. This study demonstrated an increase in blood flow when the limb was in a dependent position of about 15% over the blood flow when the limb was in a horizontal position. In addition, they demonstrated a large increase in the arteriovenous oxygen difference in the presence of slight muscular activity. It could be concluded that any postural exercises designed to increase the peripheral circulation should be carried out only if muscular tension is avoided. Active muscular exercise as suggested in the standard Buerger-Allen procedure appears undesirable.

The study of Wilkins may explain in part the clinical effectiveness of the Sanders oscillating bed. During this maneuver the patient lies quietly in bed and is completely free from muscular tension. The Sanders bed, in our experience, has endured the test of time and appears to be one of the best mechanical devices available for the treatment of occlusive arterial disease. It is especially effective for the treatment of edema and for rest pain.

Prior to the report of Wilkins it was noted clinically that patients with vascular insufficiency were usually more comfortable when the limbs were in the dependent position. It has been our custom to elevate the head of the bed 6 in., thus allowing the legs to be slightly lower than the trunk. Patients with rest pain usually sleep with relative comfort in this position. Any attempt to elevate the limbs, even for a few seconds, frequently results in pain. Although not as effective as the oscillating bed, this simple maneuver can be carried out easily in the hospital or home. In the presence of significant edema it may be contraindicated.

The whirlpool bath, in our experience, is helpful in treating certain ulcerated lesions. It must be carefully ed, however, regulating the time and temperature, and eration of tissue must be avoided. It is helpful in y removing crusts and necrotic tissue. It has no ace in the routine treatment of patients with vascular insufficiency without ulceration and can in no way alter *intermittent claudication.*

Some time ago my colleagues and I discontinued the use of other mechanical devices, such as the venous rhythmic constrictor and the positive and negative suction apparatus. In our opinion little help, if any, resulted from prolonged application. The physical medical measures as outlined apply equally to arteriosclerosis obliterans and thromboangiitis obliterans.

SYMPATHETIC NERVE BLOCKS AND SYMPATHECTOMY

Lumbar paravertebral sympathetic procaine hydrochloride (novocain®) blocks have been used for a long time as a diagnostic aid and therapeutic measure. This procedure is of value in determining the degree of vasodilatation that may occur and is, therefore, helpful in deciding whether or not sympathectomy may be indicated. It is not infallible, however, and should not b
used as the sole criterion for sympathectomy. As a th
peutic agent my colleagues and I have, in general,
placed the use of repeated blocks with sympathecto
when there are no existent contraindications to surg
In our experience a caudal block is a more effec
therapeutic procedure than lumbar paravertebral sym
thetic blocks. A single injection will replace mult
lumbar injections, which frequently do not reach
proper source. A good vasodilating response may
recorded along with immediate relief of pain. T
cubic centimeters of 1% procaine hydrochloride solu
is injected into the caudal canal. This enters the s
epidural space and penetrates the motor and sen
nerve roots plus the white and gray sympathetic r
This method produces a bilateral effect which, for
nostic purposes, may not be desirable. My colleagues
I have also resorted at times to continuous caudal
thesia. In the presence of a painful ulcerated lesion
edema of the foot, it is almost impossible to reliev
edema without some leg elevation. Without anest
this cannot be accomplished. When the swelling
duced, the circulation improves and the severe pain
may be interrupted. Nerve block by one method
other is essentially helpful in (1) temporarily reli
pain, (2) determining the value of sympathectomy
(3) as a form of therapy when surgery is contraindi

Sympathectomy is a valuable procedure in the
ment of peripheral vasospastic arterial diseases, su
Raynaud's disease. Its use in cases of organic occ
disease presents a different problem, and there ar
differences of opinion regarding its value. DeBa
and associates have pointed out that treatment shou
directed toward vasodilatation of the local extr
involved rather than vasodilatation of the entire va
system, such as results with the use of certain me
tions. Ray, Burch, and DeBakey [5] point out that sy
thectomy conforms to the concept of hemodyn
known as the borrowing-lending phenomenon, or h
metakinesis, which stresses the importance of fl
tions in the blood volume. This physiological mech
permits vasodilation in one area and vasoconstricti
another to occur simultaneously. The sympathetic
ous system is important in this reaction.

In properly selected cases it has been my exper
and that of my colleagues that sympathectomy usua
sults in an immediate rise in the skin temperature
limb involved. This elevation reflects increased cu
ous blood flow, which is very important in the trea
of ulcerated lesions and impending gangrene. Imp
ment in cutaneous circulation is also important in pa
without ulceration, since it obviously gives them a
greater margin of safety should trauma occur. F
to improve intermittent claudication may be due
lack of vasodilatation that occurs in the vessels sup
muscle tissue. If the major vessel is occluded comp
by disease, one cannot anticipate the occurren
significant vasodilatation to alter muscle blood flow
improving walking distance. Leriche [6] has pointe
that sympathectomy may be a failure in cases of th
boangiitis obliterans when both the artery and vei
thrombosed. Sympathectomy will then only limi
area of gangrene.

[5] Ray, T.; Burch, G. E., and DeBakey, M. E.: The "Borrowing-Lending" Hemodynamic Phenomenon (Hemometakinesia) and Its Therapeutic Application in Peripheral Vascular Disturbances, New Orleans M. & S. J. **100**: 6 (July), 1947.

[6] Leriche, R.: Causes of Failure of Suprarenalectomy and Ganglionectomy in Thrombo-Angiitis Obliterans on the Basis of 898 Operations, Angiology **1**: 432 (Oct.) 1950.

Sympathectomy is a surgical procedure of merit in the management of occlusive arterial disease of the extremities. My colleagues and I advocate the criteria suggested by Pratt,[7] who stated that sympathectomy may be important in the stimulation of collateral circulation, provided certain prerequisites are met. These are (1) the patient has given up smoking completely and permanently; (2) conservative measures have been given an effective trial with progression of the disease; and (3) in certain instances sympathetic nerve blocks have resulted in clinical improvement with a consequent rise in skin temperature. This last requirement is modified frequently because of the excellent results apparent after sympathectomy despite limited results with the block. In our experience patients with thromboangiitis obliterans respond better to sympathectomy than those with arteriosclerosis obliterans.

MEDICAL MEASURES

In discussing medical measures the importance of local foot hygiene should not be minimized. Samuels [8] has commented recently on the reduction of the number of cases of thromboangiitis obliterans observed in recent years. He suggests that this may be due to improved treatment of fungus diseases of the feet during World War II. He also postulates that a single and as yet unidentified fungus will prove eventually to be the cause of the inflammatory reaction in arteries and veins. This subject was also studied by Thompson.[9]

Routine care should include daily foot baths with soap and water, careful drying, and the application of a mild ointment, such as hydrous wool fat (lanolin). Even when fungus disease is absent, the regular use of some fungistat is desirable. The presence of an ulcerated lesion obviously modifies and changes local foot care.

The use of vasodilator drugs has received attention for many years. As yet there is no satisfactory drug that will consistently effect clinical improvement. Much of the investigative work has been performed on patients with normal circulation. Although this approach is necessary, it does not apply to the patient with arterial disease. The measurement of changes in peripheral circulation also presents a problem, and as yet no single method of evaluation has been devised which is without error. However, by using one or more methods it is possible to arrive at some conclusion concerning the effects of certain drugs on the vascular system, with particular reference to changes in the cutaneous and deep circulation. One of the drugs which has received extensive investigation is priscoline® (2 benzyl-4, 5-imidazoline hydrochloride). First introduced in 1939 by Hartman and Isler,[10] it has been accepted as a sympatholytic drug of value in vasospastic disorders. Grimson [11] and associates reported favorable results in 1948. Further studies on normal subjects and those with peripheral vascular disease have been published.[12] Priscoline® used intravenously has a powerful vasodilating effect, which acts especially on the skin of the extremities. This vasodilatation probably results from a peripheral sympathetic blocking effect. By administering it intravenously, the drug may be of value in determining the completeness of a reflex heating test and in determining suitable candidates for sympathectomy. It may be used successfully as a substitute for lumbar paravertebral sympathetic nerve blocks. When given orally, in my colleagues and my experience, it has been of help clinically in the treatment of Raynaud's disease. However, patients with occlusive arterial disease have not been benefited by the oral administration of priscoline,® large doses being used for a prolonged period. Two other sympatholytic drugs are tetraethylammonium chloride or bromide (etamon®) and dibenzylbetachlorethylamine hydrochloride (dibenamine®). Both have the ability to block the sympathetic pathway. Both must be given intravenously or intramuscularly, which presents an obstacle in clinical practice. These drugs have a more generalized vasodilating effect, resulting at times in pronounced hypotension and reduced peripheral blood flow. Clinically they have been ineffective in our experience in the treatment of occlusive vascular disease. An additional drug receiving attention at the present time is betapyridyl carbinol (roniacol®) tartrate, and a preliminary report has been submitted by Samuels.[13] My colleagues and I have used this preparation extensively during the past year on patients with occlusive arterial disease as well as on patients with Raynaud's disease and believe the drug merits further investigation. As in the case of priscoline,® this drug appears more beneficial in cases of Raynaud's disease.[12a]

Adequate reports are not available concerning the use of corticotropin (ACTH) and cortisone in the treatment of thromboangiitis obliterans. Allen [14] states that he noted no improvement in a limited number of cases. Kappert and Hadorn [15] have recently reported the use of new hydrogenated ergot alkaloids in cases of peripheral vascular disorder. Their results in 118 cases appear encouraging and merit additional investigation.

The importance of anticoagulants in the treatment of thromboembolic disease is well recognized. Their routine use in cases of uncomplicated peripheral vascular disorder is not recommended. Freeman[16] and associates have reported on the use of intra-arterial heparin in vascular surgery. More recently Freeman and Gilfillan[17] have used heparin intra-arterially in conjunction with endarteriectomy. This procedure opens a new approach for the treatment of arteriosclerosis obliterans with complicating thrombosis, and the results to date appear encouraging.

Any summary of medical therapy should include some reference to the work now in progress of many investigators concerning the use of low cholesterol, low fat diet, combined with lipotropic and endocrine agents. This subject has been reviewed recently by Morrison.[18] Several years' study will be required in order to draw conclusions from the available evidence, which would indicate that this approach is worthy of continued investigation.

Weisman and Allen,[19] by means of carefully controlled skin temperature studies and clinical observation, could detect no significant improvement following the use of histidine and vitamin C. Similar results were recorded after the intravenous use of ether. My colleagues and I have had little success clinically with nicotinic acid and papaverine. Samuels[1] has employed sodium chloride intravenously in the treatment of thromboangiitis obliterans and arteriosclerosis obliterans. He has reported excellent results when the preparation is used concurrently with routine measures, although other[20] workers have not substantiated his experience.

This report of management .of occlusive peripher vascular disease omits by necessity many important fac- tors, especially those related to the local care of th extremity with advanced arterial insufficiency. Althou laboratory evidence is lacking, the clinical picture o thromboangiitis obliterans is, in my opinion, consiste with a specific etiological agent. Even in the absence of known cause, patients with thromboangiitis obliterar can be treated successfully. In contrast, arterioscleros obliterans presents a more difficult problem, and avai able treatment is chiefly palliative in nature.

CONCLUSIONS

There is no single form of treatment for the manag ment of occlusive peripheral vescular disease. Adequ therapy combines the intelligent use of physical me cal, surgical, and medical measures. Persistent use conservative measures, as outlined, may result in savi many limbs.

MANAGEMENT OF ABNORMAL PRESENTATION DURING SECOND STAGE OF LABOR

Daniel B. Dorman, M.D., Pittsfield, Mass.

In recent years there have been few radical changes in the management of abnormal presentation during the second stage of labor. But it behooves us all to review our results periodically and to attempt to improve our fetal salvage. This may often be accomplished by emphasizing such commonly accepted procedures as sterile vaginal examination during labor or frequent auscultation of the fetal heart. Many hospitals require obstetric consultation for prolonged or complicated labor, such as those with abnormal presentation. A good physician, whether a specialist or general practitioner, should not hesitate to consult another physician.

GENERAL CONSIDERATIONS

Etiology.—Though there are numerous causes of abnormal presentation, the commonest are the following: cephalopelvic disproportion, relaxed musculature of the multipara, prematurity, placenta previa, congenital anomalies, twin pregnancy, and pelvic mass. Frequently no definite cause can be found, and yet abnormal presentation may recur with a subsequent pregnancy.

Diagnosis.—Though the diagnosis of abnormal presentation should be made as early in labor as possible, or even before onset of labor, one frequently becomes aw of the abnormal situation for the first time when the ond stage is reached and the fetus fails to descend. cause of the tense abdominal wall, abdominal *palpat* may give little help in diagnosis. Rectal examinati though giving more information, may merely indicate unusual problem without disclosing the presenting p It is at such a time that a sterile vaginal examinatio often of great assistance in evaluating the presenta and position and the progress likely to be made further conservative measures. X-rays of the pelvis another desirable aid in diagnosis. They may be use the second stage of labor to check on the abnormal p entation and its cause.

Choice of Delivery.—In general, if satisfactory p ress is being made and if the condition of the mother baby is good, it is safe to be conservative. When littl no progress is being made, there is no point in wai longer for active intervention. The choice of proced will be influenced by the cause of the abnormal prese tion, by the condition and viability of the baby, and the condition of the mother. The age and parity of mother may be a factor, as well as the length of tim labor or with ruptured membranes. The physician *sho* usually select a procedure with which he is familiar. should have clearly in his mind the position of the fe

---

Read before the Section on General Practice at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 14, 1951.

the relation of the forceps to the fetus and to the birth al. Gentleness and skill should replace force and ng traction. A cesarean section may be preferable to fficult vaginal delivery when no consultant is avail- . But one should also bear in mind that despite the ent of antibiotics the statistics on cesarean section w that it does not approach the safety of a vaginal de- y for the mother.

upportive Measures.—To the Fetus: The checking of fetal heart rate at frequent intervals becomes more ortant as the second stage is reached. This cannot be emphasized, for with abnormal presentation prolapse e cord is much commoner than in normal labor. In event of signs of fetal distress, appropriate measures ld be taken, including the administration of oxygen e mother. A suction catheter, oxygen, resuscitator, ulants, and incubator should all be ready in case the should be slow to breathe. Although use of vitamin as not reduced the incidence of intracranial hemor- e as much as was originally hoped, there are few who ld deny this to a woman in complicated labor or to by after difficult delivery.

o the Mother: Since prolonged labor is frequent with ormal presentation, supportive measures are of the ost importance when the mother is nearing delivery. quate sedation should be given, at the same time iding suppression of the contractions or depression of emature infant. Intravenous fluids should be given as cated, and blood should be available for emergency. ibiotics and sulfonamides are often used when labor nusually extended or if membranes have been rup- d. The use of oxytocin injection (pitocin®) in the nd stage of labor should be condemned for abnormal entation. It is in such cases that fetal death has oc- ed from intracranial hemorrhage.[1] Whether or not is sympathetic with the teaching of natural child- 1, most practitioners and obstetricians recognize the e of encouragement and reassurance which allow a ent to relax at least between contractions. It is in the part of the labor that one or more visits to the patient important for her morale.

Anesthesia.—The type of anesthesia selected will de- d to a large extent on whether uterine relaxation is uired. Inhalation anesthesia will never be replaced en- ly, for the safety and ease of administration of ether well known. In many small hospitals where obstetri- anesthesia is given by untrained personnel, open drop er is still the best choice. Nitrous oxide, cyclopropane, l chloroform all have their advantages. Intravenous pental (pentothal®) sodium anesthesia is employed ome centers successfully but is not suitable for general in smaller hospitals.

In the field of conduction anesthesia the saddle block replaced caudal anesthesia in many areas because of ease and safety with which it can be given. Though as prolonged as continuous caudal anesthesia, it may be given in the last part of labor before delivery is un. Excellent perineal relaxation is obtained, and quently a fetus in a posterior position or a breech sentation may be quite easily delivered under a low nal anesthesia. For internal podalic version or for a h rotation of the head, inhalation anesthesia is preferable. Similarly, pudendal block and local infiltration have their place in a physician's armamentarium—for a patient who has vomited under general anesthesia.

Complications.—Among the complications associated with abnormal presentation, prolonged labor with cervical dystocia or secondary inertia is the commonest. Other untoward events might include development of a pathological contraction ring, prolapse of the cord or an arm, or rupture of the uterus. And in the later stages of labor retained placenta, atony of the uterus, and postpartum hemorrhage are not uncommon. The management of these individual complications is not within the scope of this paper.

SPECIFIC PROBLEMS

Occiput Posterior.—Because of excessive molding of the head, with caput formation, the diagnosis of this condition may be difficult. Feeling the ear by vaginal examination will usually give the clue in such a case. Anyone who has followed patients in labor with repeated examinations knows that a high percentage of fetuses in occiput posterior positions will rotate spontaneously to the anterior. This percentage is quoted to be from 70%[2] to 97%.[3] No rigid time limit should be set for all cases, but if no rotation has occurred after two hours of full dilatation in a primipara or after one hour in a multipara, it would seem reasonable to assist the delivery. The physician may at times be plagued also by incomplete dilatation of the cervix in these cases.

Delivery is usually accomplished by rotation manually or by forceps (Scanzoni maneuver). Occasionally with a small baby or with a roomy pelvis, the baby may be delivered in an occiput posterior position. Such a delivery, however, runs the risk of undue trauma to the baby or lacerations to the maternal soft parts. Internal podalic version is rarely necessary, and cesarean section should be reserved for disproportion.

Transverse Arrest.—Caldwell, Moloy, and D'Esopo[4] have emphasized the frequency of transverse position of the fetal head in the descent into the pelvis. Yet occasionally with a flat pelvis or a large baby, the baby in such a position will not rotate or in an occiput posterior position will rotate only to the transverse. Here again time should be given in the second stage to permit the head to descend and to rotate spontaneously. If intervention is necessary, rotation may be assisted manually or by forceps. The Barton and the Kielland forceps are particularly adapted for such problems, but the commoner Simpson forceps may also be used. If a perfect application cannot be made at first, gentle rotation with subsequent reapplication of the blades is often feasible and will not injure the baby. Frequently the head may seem to descend more easily in the transverse position, with rotation accomplished on the perineum. Use of axis traction or supplementary suprafundic pressure may prevent excessive trauma.

Breech Presentation.—This group includes many premature infants and also many anomalies. The complications to be guarded against particularly are disproportion and prolapse of the cord. A good rule is to have an x-ray of all primiparous breeches. There is some disagreement as to the optimum time for delivery of a breech. But for one who is not trained in obstetrics, it is preferable to wait until the buttocks have been delivered spontaneously before assisting the delivery. This is particularly true of a premature infant, in which the head is proportionately larger than the body, or of a single footling presentation, when dilatation of the cervix may not be complete. Another physician or a nurse should be available to assist at the delivery. An episiotomy should be made before delivery is started. Progress in extraction must be steady, but movements must not be hurried or forceful. Use of Piper forceps to the head, if this is not delivered easily, will prevent trauma to the infant. Cesarean section again should be reserved for cases of disproportion or for borderline pelvic measurements in an elderly primipara.

Face Presentation.—Many face presentation babies will be delivered spontaneously, chin to pubis, if sufficient time is allowed, and with easy low forceps delivery included 75% will offer no great problem.[5] Internal podalic version may be the method of choice in some cases, though because of risk to the mother and fetus this maneuver has been used less frequently in recent years. Cesarean section is usually done in about 10% of cases, being especially indicated in cases of disproportion or when the chin is in a posterior position. Cesarean section done at the second stage of labor should be of the low flap or extraperitoneal type.

Brow Presentation.—Fewer babies of this cl
tion will be delivered spontaneously, and the prog
worse for the fetus. Attempts may be made und
anesthesia to flex the head to convert it to an o
presentation or, failing this, to convert it to a face p
tation. Such conversion, however, may not be p
If no progress is made, podalic version or cesare
tion may be the procedure of choice.

Transverse Presentation.—Because of the rel
high maternal and fetal mortality rates,[6] diagn
transverse presentation should be made as early a
sible, and when the condition is suspected, x-rays
be taken. Prolapse of the cord and arm are co
Cesarean section is probably the safest method
livery in the average case, and, of course, the feta
rate must be checked just before operation. If th
nosis is not made until the second stage of l
reached and if the membranes are intact or recen
tured, the skilled physician may safely and prop
an internal podalic version. In the case of a dea
Braxton Hicks version is the best choice.

SUMMARY

The diagnosis, choice of delivery, and su
measures to the mother and fetus in the second
labor are discussed, first in general and then in
to specific types of abnormal presentation.

SURVIVAL, RESCUE, AND RESUSCITATION

Rear Admiral B. Groesbeck, Jr., (MC) U. S. N., Washington, D. C.

The Armed Forces are keenly interested in survival, rescue, and resuscitation. They desire to conserve manpower and to maintain high morale, and the development of survival, rescue, and resuscitation techniques contribute to both of these factors. The aircraft pilot, the submariner, the men who man the surface ships, and the amphibious forces transported therein know that there are inherent dangers in the performance of their duties, many of which have nothing to do with the dangers of actual combat. It is a comforting feeling for them to know that efforts are being made and equipment provided to increase their opportunity of survival and the possibility of rescue in the case of accident or disaster.

A great deal of survival equipment was developed during World War II principally for the support of the aircraft pilot. Starting as a simple first-aid kit, the equipment developed into a variety of more or less comprehensive collections of gear designed to provide shelter and means of sustenance, with particular em
tropical conditions. Recently survival problem
than those met with in the tropics have assume
tance, and it has become necessary to develop
equipment and techniques on a global basis.

SURVIVAL AND RESCUE

Aircraft.—As for aircraft, the design conf
and the high speeds of new types necessitated
velopment of a device which would permit saf
from the aircraft in emergency. For various
unaided escape is neither easy nor safe, and as
there was developed the ejection seat which p
safe means of egress. The antibuffeting helmet
veloped to protect the head of the pilot during th
vibrations of uncontrolled aircraft.

However, with the pilot clear of the ship, s
problems arose. The opening shock forces of t
ard parachute at high altitudes and high speeds
such a magnitude as to create a further poss
severe injury. It was necessary to improve the
the parachute in order to lessen shock, and it
imperative to improve oxygen equipment for
scent from extremely high altitude to prevent a

The opinions contained in this paper are those of the author. They are not to be construed as necessarily reflecting the views or the endorsement of the Department of the Navy.

ce the airman is safely down, further problems in
al confront him, depending on the area in which
ds. A great deal of military flying is being done
arctic and subarctic areas, over both land and sea,
lucing the need for development of other survival
ment and knowledge. The know-how to live in an
nely cold and relatively barren area is obviously
tant. It is necessary not only to supply equipment
train personnel in its use and to care for them-
under severe climatic conditions.

e philosophy regarding survival equipment has
gone recent changes. It has been necessary to ana-
he emergency nature of the various survival situa-
in order to establish the fundamental requirements
ms of survival gear. Because of space and weight
tions, the gear carried in fighter planes is curtailed,
this equipment is purely short-term emergency
ment. Items designed for prolonged survival are
d by special rescue aircraft. In sustenance kits of
emergency type, the material is intended to make
erson comfortable until either rescue takes place
short time or long-term survival supplies can be
hed. It should be emphasized also that there is a
uing need for further methods of early location of
nnel down in remote, isolated, and difficult terrain
n ocean areas.

e extensive study devoted to the clothing necessary
e properly with the survival situation on the ground
the water has resulted in the development of all-
se types. In spite of considerable progress, this
ment has not yet reached perfection. Immersion
ction for the person suddenly thrown into the cold,
en cool, water presents a considerable problem.
rsion is a highly lethal hazard. A human body cools
immersed in water at a temperature of less than
, and the warmest open-ocean water in any latitude
time of the year is 84 F. The rate of loss of body
ncreases rapidly as the temperature of the air and
falls. Persons, even in warm climates and while
in life rafts, lose body heat by evaporative cooling.
rson in water in the Aleutian area with a water
rature of 30 F. may survive only 20 to 30 minutes.
sure to sea water for a long time, although not suf-
t to kill, does, by a general chilling of the body, act
y to cause gangrene. An exposure suit for protec-
against immersion is a highly desirable piece of
ment for survival when one is operating over or on
ater and immersion is a possibility. During World
II the need for fireproof or fire-resistant clothing for
the aviator and rescue teams was pointed out. Con-
able progress has been made on these items.

hen a person is forced down in an aircraft or
dons a ship at sea, he is faced by two chief problems
s efforts at survival. First, he must have flotation
of a sort, and, second, he must have water to drink.
l, compact, yellow-colored rubber life rafts have
developed for the airman to carry. The yellow color
n the raft's detection, and when special search-type
es are used by the rescuers, filters in the goggles
tuate the yellow color against the background of
a, making the raft more readily detectable. Other
rafts, including large dropable rigid boats, are part
e equipment used in rescue of persons in the sea.
life rafts are equipped with cans of water, but better still are the compact devices which can be used to manufacture potable water from sea water. These include desalinization kits and solar stills.

An item in the survival category which is very much needed is a comprehensive and concise weatherproof manual for survival on land and sea under all climatic conditions. Such an item would furnish ready information on survival procedures under all conditions and greatly enhance the chances of personnel forced to shift for themselves under difficult circumstances.

Extensive field trials have been made of much of the recently developed survival equipment. Collaboration with the British Navy, Royal Air Force, and our Canadian neighbors in evaluating this equipment has made it possible for an extensive review to be made of all the presently available equipment and techniques. Shortcomings of some of the items have been demonstrated, but perhaps the greatest weakness of all is in the lack of indoctrination and training of personnel in survival techniques and use of equipment. It is apparent that the Armed Forces as a whole must carry out an extensive program in survival training, especially in cold-weather survival, if we are to be successful.

In the field of rescue equipment and techniques, I am certain everyone is aware of the remarkable adaptability of the helicopter in short-range rescues. There are numerous accounts of the rescue of downed aviators through the use of this remarkable aircraft. There is still, however, need for the improvement of this rescue device. This improvement involves some of the design features of the aircraft itself, as well as the equipment used for picking up personnel and comfortably transporting them to a more favorable location. Recently, in one instance, an injured naval aviator down at sea was unable to be rescued by helicopter because he was physically incapable of securing the line to his person so that he might be hoisted into the aircraft.

Submarine.—In submarine escape considerable advance has been made. Experience in the past has shown that indoctrination and training in procedures for escape from disabled submarines has been very valuable. Submarine personnel should be made intimately acquainted with the principles involved in the physics and physiology of the gases employed in the individual submarine-escape device as well as with the technique of "free" escape for use in shallow water. For moderately deep escape there should be a compression chamber on hand to treat those persons in whom decompression illness develops. For escape from extreme depth (150 ft. or more), another technique developed and used with success in the rescue of personnel from the USS Squalus is that of the rescue chamber. This chamber is lowered over the hatch of the submarine, and survivors are brought to the surface by raising the chamber itself. There are two escape-training tanks in operation in the Navy. These are at New London and Pearl Harbor. Training in these tanks acquaints submarine personnel in the techniques for both "lung" and "free" escapes.

RESUSCITATION

The subject of resuscitation is presently under intensive study. Under the guidance of Dr. David B. Dill, Scientific Director of the Army Chemical Corps Medical Laboratory, a group of highly interested and very capable scientists from various parts of the country have been investigating the problem of resuscitation techniques for the Armed Forces. These persons have been mainly interested in manual resuscitation techniques. When the most effective methods to be used in resuscitation were being determined, some very fundamental studies in cardiorespiratory physiology were carried out. Determination of lung volume-pressure relationships is important with respect to body positioning. These relationships are changed by body positioning and the role of the abdominal content in limiting excursion of the diaphragm and in other instances in producing diaphragmatic movement. This latter factor is taken into account in some of the techniques in resuscitation.

There has recently been an evaluation of the various manual resuscitation techniques by Wittenberger and Sarnoff, Ivy and his group, and others. It is generally agreed that the Schafer method is a poor one, although it is the most widely used, since the amount of air moved in and out of the lungs during each induced respiratory cycle is small. The Eve method, which makes use of the weight of the abdominal organs to alternately push and pull the diaphragm up and down like a piston, has the approval of many. However, this method requires a certain minimum of equipment, and often such equipment is not available or is available only after some delay. An occasion may arise in which a delay of as much as 30 to 60 seconds would be serious. An effective method which requires no equipment, but which uses the push on the diaphragm by the pressure of the abdominal organs, is the hip-lift method. To obviate the fatigue of the operator and still maintain effectiveness, the hip-roll technique has been suggested as a substitute for the hip-lift.
This latter method can be done for longer perio
time and is as effective as the hip-lift method. It has b
further modified by ending each cycle with compres
of the lower part of the chest, as in the Schafer met

It is yet a question whether manual artificial res
tion is as efficient as insufflation of the lungs by a
chanical device. The margin of difference between
two often appears to be small. To rely entirely on
chanical methods to reinstate breathing would not se
to be the best policy to follow. In some of the ov
whelming accidents with sudden asphyxia or respira
failure, delay in restoring respiration while one is wai
to procure, apply, and adjust a machine would be f
hardy.

That mechanical respirators are of considerable va
is not denied. When they are readily available and o
ated by experienced personnel, they often have a dist
advantage over manual methods. They may be opera
for prolonged periods of time and permit the admi
tration of either 100% oxygen or various gas mixtu
Regardless of the merits of mechanical resuscitation,
matter of primary importance to the Armed Forces
day is the selection of the most efficient metho
manual resuscitation and the training of its person
that method. For a good many years all personnel
been trained in the use of the Schafer method, and
job of retraining in a new method is not inconside
when one considers the number of persons involved
avoid confusion, the method chosen must be
acceptable to civilian groups, and training in resu
tion as a first-aid measure must be standardized thr
out the United States.

VENEREAL DISEASE CONTROL

John J. Wright, M.D., Chapel Hill, N. C.

The modern venereal disease control program in the United states may be said to have begun on May 24, 1938, when the National Venereal Disease Control Act of 1938 was passed—

> For the purpose of assisting states, counties, health districts, and other political subdivisions of the states in establishing and maintaining adequate measures for the prevention, treatment, and control of the venereal diseases; for the purpose of making studies, investigations, and demonstrations to develop more effective measures of prevention, treatment, and control of the venereal diseases, including the training of personnel.[1]

When venereal disease control is talked of, syphilis is usually spoken of. Syphilis and gonorrhea are by far the most prevalent of the venereal diseases, and gonorrhea is many times more prevalent than syphilis.
control of gonorrhea may still be considered a
health function, the use of the sulfonamides and
in its treatment, with the concomitant reduction of
complications and the promptness with which in
persons seek treatment,[2] place it in a different
from syphilis. So in my discussion of the control of
real diseases, I will be speaking principally of the
of syphilis.

CONTROL MEASURES

In the United States the venereal disease contro
gram is based on six major administrative proce
which have been aptly described by Dr. J. E. Moor
least one or more of the measures to be mentioned
stitutes the control programs carried on in different
of the country.

Methods Planned to Reduce Number of Pote
Infectious Exposures.—The objective here is mo
tion of human behavior, i. e., reduction of sexual pr
cuity. Most of these methods represent primarily
munity rather than medical or public health effort.
are long term rather than short and are difficult to e
ate. The failures of the methods involved are meas

lical and Administrative Research.—This refers to ping and testing methods of control, evaluating ffectiveness, and answering the unsolved medical nmunological problems relating to syphilis which lescribed in 1939.[4]

EFFECT OF CONTROL MEASURES

at has been the effect of these methods of control ave been so sketchily described? Have the purposes National Venereal Disease Control Act been met? is the evidence?

le 1 summarizes reported mortality and insanity syphilis for the years 1933 through 1950.[5] An ge of 20,053 deaths from syphilis occurred each the continental United States from 1933 to 1939, ng in a rate between 15 and 16 per 100,000 popu- In 1940 the rate began to decline steadily, which ontinued through 1950 when the Public Health e estimated the rate to be 7.0 (about 10,000).[6] lecrease is particularly meaningful in view of the increasing accuracy in the reporting of deaths due to syphilis since 1939.

From 1933 to 1936 first admissions to mental hospitals (exclusive of veterans hospitals) for psychoses due to syphilis occurred at the rate of 6.6 per 100,000 civilians. This rate remained at the same level until 1943, when 7,284 patients were admitted, a decrease to 5.4. In 1949 there were 4,690 such patients admitted, a further decrease to 3.2 per 100,000.[7]

In 1933 before their first birthday 1,639 babies died from syphilis, resulting in an infant mortality rate due to syphilis of 0.79 per 1,000 live births for that year. In 1940 there were 1,251 infant deaths from this cause, and in 1948 only 438 infant deaths were due to syphilis, resulting in a new low of 0.09 deaths from syphilis per 1,000 live births.[8] With the recognition that deaths and disabilities due to syphilis are not all reported as such, there is no doubt that these figures represent a true decline in mortality and mental disease due to syphilis.

TABLE 1.—*Reported Mortality and Insanity Due to Syphilis, Continental United States, 1933-1950*

	Syphilis Mortality Per 100,000 Population			Infant Mortality Due to Syphilis, Rates Per 1,000 Live Births			First Admissions to Mental Hospitals Due to Syphilis, Rates Per 100,000 Population *

What is the evidence regarding the frequency of syphilis in the general population? It is well known that not only are many cases undiscovered but that, of those which are diagnosed, a considerable proportion are not reported. Despite these rather serious limitations, however, much can be learned by examining the data on the reported cases of syphilis.

The Figure is a graphic representation of statistics compiled by the Public Health Service[9] showing the reported cases of acquired syphilis since reporting by stage first began in 1941. First, it is seen that the discovery rate of late and late latent syphilis reached a peak in 1943, then fell sharply, and has leveled off since 1947. Second, the number of cases of early latent syphilis reported has remained at a fairly constant level. Finally, the number of reported cases of primary and secondary syphilis rose slowly from 1941 until the close of the war, when it rose sharply. After this the number fell rapidly until in the year 1950 it reached the lowest level since reporting by stage began, and this decrease has continued into 1951.

Federal Security Agency—Public Health Service Division of Venereal Disease Office of Statistics.

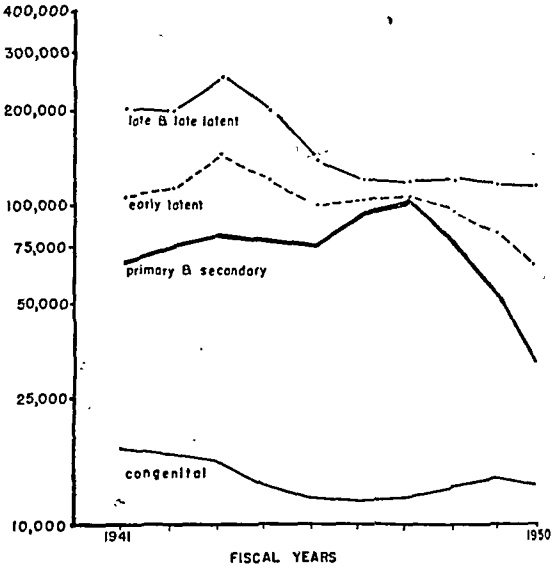
The backlog of undiagnosed late and late latent syphilis in our population has been materially exhausted, thereby reducing the size of the reservoir of disability and death. In the reservoir of syphilis infection there
other group—the undiscovered infectious cases—
perpetuate the disease. How many newly acquire
are not being diagnosed and treated? It is known,
bases of reported cases alone, that there are mor
being reported in the early latent stage than in p
and secondary stages. This means that over half
infections with syphilis (actually about 60%) ar
missed in the period of maximum infectiousness.

The Figure also shows the disturbing statistics
genital syphilis. During the period of widesprea
penicillin, the number of cases of congenital syp
ported has remained constant. Furthermore, on
fourth of the congenital syphilis cases reported
children of 14 years or younger is being discovere
first year of life.[10] This points to failure some
the program.

The crux of today's syphilis problem is the d
of early cases. The attack rate now needs to be
the guiding index of the effectiveness of the con
gram. Modern treatment has virtually swept a



Reported cases of syphilis in the civilian population of United States from 1941 through 1950.

case-holding problems of syphilis control. Asi
educational and other measures aimed at reducin
iscuity, the core of the syphilis control progra
therefore lie in the persistent and diligent applic
effective case-finding procedures. To control th
of syphilis the use of those methods which find t
in the infectious stage needs to be increased.

How much money has been spent in de
and carrying out the program described? T
shows the funds budgeted for Venereal Disease
in the United States from 1939 through 1951. A
$315,628,786.00 has been spent by official
(local, state, and Federal) since 1939. Does th
expenditure of funds represent a sound investme
the point of view of return for the money invest
jective evidence of this return on the investment i
in Table 3 by the saving in the cost of maintainin
ilitic psychotics in mental institutions since the be
of the Federal grant-in-aid for venereal disease

The average duration of hospital life for such p
is 10 years; at a cost of $3.00 per patient per day,

10. Editorial, J. Ven. Dis. Inform. 30: 241 (Sept.) 1949.

:onservative estimate, the hospitalization cost alone ;ingle syphilitic psychotic is $10,950.00. The actual ;sions saved during the 13-year period (1937-1949) ɔmpared with the admission rate for the 4-year d (1933-1936) were 21,969, resulting in a saving :40,560,550.00 in hospitalization costs alone.[7] Add is the saving of loss of earning capacity of 219,690 years, and this one element of saving is greater than ɔtal investment itself.

the period 1937-1948 over 14,000 more children d have died in infancy from congenital syphilis had ıfant mortality rate due to syphilis during the years -1936 been maintained constant through 1948. It d be presumptious of me to place an economic value ese lives saved. It is estimated that each death from ilis represents a loss of 17 to 26 years of life.[12] The ng capacity of these man years of life saved repre- a sizeable return on the investment. The economic : of the reduction of venereal disease disability from ovascular syphilis and from syphilitic blindness and ıalmia neonatorum defies calculation.

ıere is evidence that since the development of safe, ɔensive, and easily administered schedules of treat- : utilizing penicillin there has been a shift back to rivate practitioner so far as the treatment of syphilis ɡonorrhea is concerned. This is a shift that may have dvantages in control. However, the practicing phy- n must utilize more effectively the contact-investiga- techniques which have been demonstrated if the nward trend in the attack rate is to continue.

rom the point of view of reduction of mortality and ɔidity, there is no question that the present program is carried on has lessened the problem of syphilis in rica and has more than repaid the money invested. n the point of view of prevention of congenital syph- however, there is evidence of serious failure of the program and a need for reexamination of the procedures being used to prevent this unfortunate complication.

So far as the prevention of the spread of syphilis is concerned, there has been less improvement over the years. There is obvious need, therefore, for immediate intensification of case-finding activities directed at this phase of the problem. Success here will eventually and automatically resolve the other problems connected with the disease. There is need, therefore, to reexamine our case-finding activities and reemphasize those measures directed at the infectious case.

The Public Health Service, through its Venereal Disease Division, has exerted leadership and stimulation without interference for venereal disease control programs on the local level, where the gains cited have all been made. Along with the decline in the incidence of reported syphilis, there is properly occurring a reduction of funds allotted to the venereal disease control program. However, there is evidence that the reduction of funds is resulting in a deceleration of control activities to such an extent that it may be impossible to maintain the gains that have been made. The American Venereal Disease Association is exploring the feasibility of calling a national round-table conference of interested professional and lay persons from different parts of the country to review without prejudice the present status of the venereal disease control program in this country and to attempt to make recommendations to serve as a guide for the program for the next decade on Federal, State, and local levels. The time is ripe for reviewing the present status of the whole field in an attempt to establish a blueprint for the next few years.

:RITICAL EVALUATION OF PUBLIC HEALTH PROGRAMS IN NUTRITION

Norman Jolliffe, M.D., New York

ıe science of nutrition has made sound progress since). With modest beginnings at the turn of the century, ition has eradicated or possesses sufficient know-how 'adicate all the classical deficiency diseases prevalent ıe first quarter of this century. Thus, rickets, infantile vy, and pellagra—all common diseases in the first :ter of this century—for practical purposes have been ıinated as public health problems.[1] Beriberi and oflavinosis, which both paraded in this country under ıriety of pseudonyms during the first quarter of this ury, are now at the beginning of the third quarter tively rare diseases in the large charity hospitals, ıks to a rising standard of living, health education, min supplementation, and bread, flour, and corn chment.[1] Means are available to prevent simple er and most nutritional anemia. They should no ɡer exist in this country, but unfortunately they do.[1]

arallel with this virtual eradication of some classical ciency-disease syndromes has been the marked im- vement in maternal, infant, and child health and the virtual elimination as public health problems of many infectious and contagious diseases—typhoid fever, infantile diarrhea, diphtheria, syphilis, and pneumococcus pneumonia. These are no longer major personal or public health problems. It is probably safe to predict that in the lifetime of many of us tuberculosis will be eradicated as a public health problem. These advancements have made arteriosclerosis and its allied diseases our number-one public health problem. Sixty million Americans now living will die of it. A new plague, although an old disease, has arisen to smite us. This fact must be met by drastic changes in the direction of public health practices, no matter how untraditional and unconventional these changes may be.

From the Bureau of Nutrition of the Department of Health.

Read in the Symposium on Critical Evaluation of Public Health Programs before the Section on Preventive and Industrial Medicine and Public Health at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 15, 1951.

1. Jolliffe, N.; Tisdall, F. F., and Cannon, P. R.: Clinical Nutrition, New York, Paul B. Hoeber, Inc., 1950.

Diet plays an important role in the development and course of many chronic degenerative diseases. Although nutritional factors are not now known to play a direct part in the etiology of malignant neoplasms, it is known that the incidence of oral, gastric, vulvar, and liver malignant neoplasms are somewhat greater in those with chronic glossitis and cheilosis, atrophic gastritis, vulvar leukoplakia, or liver cirrhosis, all of which are due at least in part to malnutrition. Furthermore, life insurance records show that overweight people are more liable to cancer than those of normal weight.[2]

Hypertension is much commoner in those who are obese, and the incidence of cardiovascular renal disease is one and one-half times as common in the obese as in persons of average weight.[2] In hypertensive obese patients weight reduction often results in a lowering of blood pressure, improved cardiovascular efficiency, and a better maintenance of cardiac compensation. An effective obesity-control program might well lower the incidence of cardiac disability.

The precise role of dietary cholesterol in the genesis and development of atherosclerosis is incompletely understood. The recent work of Gofman and his associates [2a] indicates a correlation between a certain cholesterol fraction and atherosclerosis, which, if confirmed, introduces the possibility that atherosclerosis could be attacked effectively in a public health program.

The incidence of diabetes is more than twice as great in obese adults as in persons of average weight. Eighty per cent of diabetes in adults is associated with obesity.[2] The signs of diabetes can be completely eliminated in many obese diabetics by weight reduction, and in many others the severity of the disease is greatly modified. Had obesity been prevented in such persons, it might be expected that the onset would be postponed or perhaps completely prevented in some instances.

That degenerative and cirrhotic disease of the liver may be produced by abnormal diets has been demonstrated repeatedly. Liver cirrhosis is a cardinal feature of Kwishikor, or malignant malnutrition of childhood, so prevalent in equatorial America and Africa. The nutritional state also has been shown to be important in the resistance to toxic agents causing liver damage. Patients with cirrhosis of the liver can be improved markedly, in most instances, by nutritional therapy. These facts make it reasonable to assume that adequate diets would do much to prevent diseases such as cirrhosis of the liver in man.

All these problems of chronic degenerative diseases, as well as many others, must be answered by research and field investigations. How well have the public health services, national, state, and local, met this new challenge? The recent report of a subcommittee of the Food and Nutrition Board [3] has reviewed the situation in our
state health departments. This committee points o
most state health departments have personnel de
either part or full time to nutrition. The organiz
varies greatly from state to state. In some instanc
confined to one nutritionist assigned to a special ph
a division's program, while in others it has as
divisional or bureau status comparable to that for
major activities.

The several states vary widely in population,
wealth, and nutritional problems. Furthermore, the
structure of administration and operation varies be
states. Therefore, it is not practical, nor is it desi
to suggest a rigid pattern of organization which
be generally applicable to all states. It is possible,
ever, to envisage a framework of organization
which most states can develop and operate a satisf
program.

This report suggests that in each state there sho
established in the framework of the health depart
separate unit corresponding to a major organiz
subdivision, such as a bureau or division. Such
would assume responsibility for initiating and d
programs appropriate to the nutrition problems
particular state. The unit approach would ena
health department to define the needs and evalu
efforts to meet them. Such a unit approach woul
likely assure a coordinated program throughout
partment.

A public health program for nutrition evaluat
improvement should include a combined
dietary, and biochemical approach. Within th
therefore, there should be included a physician
in nutrition and public health, a chief nutrition
sufficient assistant nutritionists to provide consul
to counties, cities, and institutions throughout th
and either a biochemical set-up or the availabili
adequate university or hospital laboratory equi
perform the necessary biochemical tests. There
also be arrangements for consultation and ser
required from health education specialists *and*
cians.

Where practicable, a nutrition field team consi
a physician, nutritionist, nurse, and technicians
be organized for carrying on field investigations,
demonstrations, and pilot studies. This field team
important; not only does it provide the necessary
of the public health nutrition unit with the public
medical profession, but such activities make it pos
recruit well-trained medical personnel into public
nutrition. Without such a unit, most young, well-
medical men will not even consider this field for a

In states which do not have, or think they do no
the resources to permit the employment of quali
trition personnel for complete staffing of the n
unit on a full-time basis, other arrangements for
and consultations should be made. Here the n
program may be greatly assisted by working close
the Nutrition Branch of the United States Public
Service, when it is reinstituted. In the meantime,
ance of nutrition committees, councils, medical s

her state department groups, interested civic organiza- ns, and business and professional associations can be ilized. It is essential, however, that responsibility for rection and operation of nutritional activities be vested a scientist, specifically a physician, high in the organi- tional structure of the state health department. He ould be able to discuss nutritional problems, their ap- ication to different fields, and their relationships to er-all policy on an equal professional footing with her policy-making staff members. The operations ould be carried on as a unit activity with close coordi- ition with other units, since nutrition problems are herent in most health department activities. In certain ograms it may be desirable to assign such personnel to her major divisions or even other state departments, ch as those responsible for institutional care. However, these instances such personnel should receive their chnical direction from the director of the nutrition unit.

Let us now examine the situation at the Federal level. e Children's Bureau of the Federal Security Agency[4] s been directed by law to investigate all matters re- ting to the welfare of children and child life. This reau employs only five nutritionists, but through ants-in-aid the influence of this bureau has been multi- ied many times in that it has enabled most states to nploy nutritionists in the field of maternal and child e.

The Bureau of Human Nutrition and Home Eco- omics of the Department of Agriculture is interested the economics of food production and distribution and food composition and consumption in relation to onomic status and the recommended dietary allow- ices. It concerns itself with menu planning and prepara- n and the promotion of better balanced and more gen- ous consumption of food for the entire population. heir full-time staff does not include physicians, although ey employ a few as medical technicians on a per diem sis. They operate through agriculture experiment sta- ons, departments of agriculture and home economics extension centers and universities, state and local nu- ition committees, and school lunch programs. This tivity at the Federal level is efficiently and aggressively irected and promoted.

Since November, 1950, when its Nutrition Branch as liquidated by order of the Bureau of the Budget, the nited States Public Health Service has had no field utrition activities either in its public health or its re- arch branches. Thus, as of today the Public Health ervice is completely out of contact with the nutritional ealth of the people in the United States. Furthermore, is not in a position to convert the many advances in utrition knowledge into field programs of practical enefit to the health of the people. The nutrition di- isions or bureaus of the various states have no integra- on, direction, or assistance from a Federal counterpart.

This situation has been roundly deplored by the Coun- il on Foods and Nutrition of the American Medical As- ociation, the Food and Nutrition Board of the National esearch Council, the American Public Health Associa- ion, and numerous other organizations and private per- ons who are interested in public health nutrition. These organizations have urged that nutrition activities in the Public Health Service be reinstituted promptly and vigorously. This liquidation of the Nutrition Branch of the United States Public Health Service indicates that the Bureau of the Budget was not sold or could not be interested in the medical aspects of field programs in nutrition. It is not interested to the extent of allowing money already appropriated to be used in field programs on nutrition as a factor in diseases such as hypertension, arteriosclerosis, anemia, and obesity and in field programs on the nutritional therapy of conditions such as burns, shock, irradiation damage, peptic ulcer, and others. The Bureau of the Budget in explanation of its action stated, ". . . the reduction was based solely on the Bureau of the Budget's judgment that in the present circumstances these demonstrations had a relatively low priority."[5]

What should be the nutrition responsibilities of the United States Public Health Service? First, there should be programs which apply existing knowledge and techniques in public health activities so that the people of the United States may benefit from the knowledge already possessed. These should be conducted as a part of over-all public health programs and should be the responsibility of that branch of the Public Health Service which is accustomed and experienced in dealing with state and local health departments, namely, the Bureau of State Services. Secondly, research activities are needed to develop methods, techniques, and new knowledge which can be applied in public health nutrition programs, to determine by surveys and examinations the nature and extent of the important nutrition problems of the people, and to solve by technical research the problems which may be obstacles in the public health nutrition programs. This is a proper function of the Research Branch of the Public Health Service, that is, The National Institutes of Health. May an enlightened Congress soon direct and provide for some such public health nutrition programs.

Estrogens and Cancer.—It has not been shown that estrogen effects lead to cancer in the human being, but there are several interesting suggestive relationships. In the histories of individuals developing carcinoma of the endometrium, menorrhagia, late menopause, and hyperplasia of the endometrium, all conditions associated with hyper- or persistent estrinism, appear much more commonly than they do in women without carcinoma of the endometrium. The incidence of carcinoma of the endometrium in cases of granulosa cell tumor of the ovary is four or five times the general incidence. In addition, there have been several cases of carcinoma of the endometrium reported following prolonged estrogen therapy. It is also known that carcinoma of the uterus is relatively rare in women who were castrated before they reached the age at which they would normally cease menstruating. Finally, one of the first observations suggesting that there might be a relationship between ovarian function and the growth of breast cancer was that occasionally large, fungating mammary cancers recede in a remarkable fashion after castration alone.—Daniel G. Morton, M.D., The Relation of Pregnancy to Malignancy, *Journal of the Kansas Medical Society*, September, 1951.

RESPONSIBILITIES IN HOSPITAL CONSTRUCTION

Robin C. Buerki, M.D., Philadelphia

Dr. Jean S. Felton, secretary of the Section on Preventive and Industrial Medicine and Public Health, tells me that the primary goal in the presentation of this symposium on a critical evaluation of public health programs is to have the participants review critically and objectively the actual progress being made in various public health programs throughout the country. He tells me further that the discussions should be "earthy, completely realistic, and fact facing." I assure you that no terms of reference could be more to my liking since those are the conditions under which I like to discuss any and all problems with which I may be concerned.

I am particularly pleased to have this opportunity to discuss the Hill-Burton Hospital Survey and Construction Program since I was one of the original hospital representative members of the Federal Hospital Council. This council is composed of eight individuals, whom I might modestly describe as being well-known in their respective fields; four of these are persons interested in the operation of hospitals or in the production of hospital service, and the other four represent the general public interest. The Surgeon General of the Public Health Service is the ex officio chairman of the council and is responsible for the over-all administration of the program.

The functions of the council are both controlling and advisory. They are controlling in that no administrative regulations may be issued by the Surgeon General except by and with the approval of the council. In this respect, the Federal Hospital Council is unique in the Federal government. No other citizen council, to my knowledge, has such authority conferred by Federal law.

In setting up this symposium, Dr. Felton has stated six general questions as a framework within which each of the seven program subjects might be discussed. I believe that these six questions express very well the points which we need to develop in our consideration of the Hill-Burton Hospital Survey and Construction Program.

ACCOMPLISHMENTS OF PROGRAM

The first question is, "Has the Hill-Burton Program accomplished the purpose for which it was originally established?" In order to answer this question, it is necessary to go back to the year 1940. At that time, the nation was just emerging from a 10-year period of acute depression. During that decade, there was very little new hospital construction throughout the country. While the population was increasing along with the demand for hospital care, our hospital resources were virtually standing still. Even worse than standing still, they were going backward in the neglect of normal maintenance. This fact was forcibly driven home to us when, in 1940, we entered a period of mobilization and preparations for war, which began the following year. We found then that we were totally unprepared to meet the extraordin needs for hospital and public health care in areas vital the mobilization of the nation's forces. We had to ma this crisis wherever and whenever an emergency aro through direct Federal aid to the community concern This Federal aid consisted of from partial all the w to complete Federal financing of new hospitals and heal centers. Under these conditions, surveys of need were best sketchy and the interrelated needs of other co munities could be given scant consideration.

Realizing this, the American Hospital Association, cooperation with the other national hospital associatio decided that it would be necessary to make a thoro evaluation of the hospital problem which would be fac the nation at the end of the war. Accordingly, early 1943, the American Hospital Association establishe committee on postwar planning. It was the functio this committee to determine ways and means of appr ing the nature and extent of the hospital problem. T committee decided that an independent fact-finding co *mission was the means of choice. It then enlisted* the of a number of philanthropic foundations, and thro their financial assistance established what was know the Commission on Hospital Care. This commission composed of 20 nationally-known individuals repres ing a rather complete cross section of American life interests. The American Medical Association, I m add, was well represented. The terms of reference of Commission on Hospital Care were quite broad. Bri they were to evaluate the current situation regarding pital service throughout the country and to recomm measures for its improvement.

The commission put in two years of intensive su work on this problem, beginning in October, 1944, ending its work in October, 1946. The report of the C mission on Hospital Care represents a landmark in development of better hospital care in the United Sta

Among the many important findings of the Com sion on Hospital Care was the fact that the nation short of hospital beds of all types by many hundred thousands, and that the distribution of existing hospi was very spotty. The commission found further that increasing technical requirements of modern medic were such that the deficiency of hospital beds through the country could not be met through the traditio channels of private philanthropy. The only alternati the commission found, was a program of Federal ass ance in the construction of additional hospital beds.

The three national hospital associations—the Am can, the Catholic, and the Protestant—accepted th recommendations, but I am sure not without consid able misgivings. Never before, except in brief periods emergency, had the Federal government entered into field which had historically and traditionally been matter of local responsibility. The question upperm in everyone's mind was, "Can the hospitals accept F eral assistance and still maintain their autonomy a sense of local responsibility which are the *sine qua n*

Vice-President in Charge of Medical Affairs, University of Pennsylvania.

ctive hospital operation?" We all felt that it could
ıe if handled in the proper manner, and, since we
ɔ alternative, preparations were made to develop a
ıl program which would accomplish the desired
ithout disrupting our traditional democratic proc-

ɔpe it is clear to everyone that the Hill-Burton legis-
was not a bill concocted by the politicians and
on an unsuspecting public. On the contrary, it was
a grass-roots movement spearheaded by the offi-
f the various hospital organizations and concurred
l assisted by the American Medical Association.
tual drafting of the legislation occupied the intense
st of these organizations for a period of many
ıs. Chief among the objectives of the Hill-Burton
tion were the following:

hat major controls be vested in the state governments
han in the Federal government.
hat exact surveys of need should be carried out prior to
nstruction. Once the needs had been determined, con-
ɔn should proceed in order of relative priority based on

hat each community should be required to furnish a
ıble share of the cost.
hat the hospitals constructed should represent the latest
ıg in modern design and construction.

keeping with the nonpolitical nature of this legisla-
even its sponsorship in the Senate was bipartisan.
this background, it is not surprising that no
sition was encountered to the passing of this legisla-
which was enacted into law in August, 1946.
he Hill-Burton Program, then, accomplishing what
xpected of it? It was expected that the states would
a careful survey of their present and long-range
for hospitals and health centers. This has been done
e first time in history, and I may observe here that
ırveys showed a total hospital bed deficiency of
900,000 beds of all categories. It was expected
rst needs would be met first and, generally speaking,
communities were in the greatest need. This ex-
tion has been met admirably. Approved projects
been in order of need, and the great majority have
into rural areas. Some 1,500 projects, all told, have
approved. When completed, these will add about
0 beds to the nation's resources; in addition, some
ealth centers will be added. I can say, without fear
ntradiction, that the Hill-Burton Program has ac-
lished the purpose for which it was intended far
ıd the expectations of all of us in the hospital field.

RETURN ON INVESTMENT

. Felton's second question was, "Does the Hill-
ɔn Program represent a sound investment from the
of view of return from the money involved?" Since
, Congress has appropriated 385 million dollars
is purpose. The average matching funds contributed
ıtes and local communities have been about double
ımount, involving a program of slightly more than
ion dollars invested in new hospital and health cen-
cilities since 1947. Is this a sound investment? In
rst place, it is virtually impossible to place a price
n health. We can only consider whether the invest-
is sound in a narrower sense, that is, in relation
e cost of other hospital units constructed outside
Iill-Burton Program. Although the new Hill-Burton hospitals are models of modern design and equipment, the cost compares very favorably with those constructed outside the program. Actually, the average cost of hospitals under this program has been about $13,000 per bed, in the case of new general hospitals. These costs, as many of you will recognize, are considerably below that of many other hospitals built independent of Federal aid.

PROGRESS IN PUBLIC HEALTH

The third question is, "Is the Hill-Burton Program spelling progress in public health?" Although in the past we perhaps have not always been accustomed to thinking of such things as hospitals in the same category as public health, I am doing so here. Anything that contributes to the health of the general public is public health, and in this, hospitals are an outstanding example. We can say without any hesitation whatsoever that the Hill-Burton hospitals are contributing to public health, both directly and indirectly. Most of the new hospitals are in areas which never before had adequate hospital service. In many parts of the country, we are seeing health centers designed primarily within the concept of preventive medicine built as an integral part of these hospitals, a movement which in my opinion is long overdue.

ALTERATION OF PROGRAM'S FORMAT

The fourth question is, "Should the format of such a program be altered?" The Hill-Burton Program is widely considered as being one of the most ideal pieces of health legislation in existence for the following reasons: It recognizes a large element of state and local determination without unnecessary Federal controls. It has brought about a better understanding and spirit of cooperation between hospitals and government—state, local, and Federal. It stimulates local communities to help themselves, thus assuring continued interest and support of these new hospitals.

RESPONSIBILITIES OF PUBLIC HEALTH PERSONNEL

The fifth question is, "What are the responsibilities of public health personnel?" This question may be applied to the responsibilities of the state agencies administering the Hill-Burton Program; with relatively few exceptions these agencies are the state departments of public health. Their responsibilities are quite clearly defined. I shall mention just a few of these:

1. A continuing survey of hospital and public health requirements and a preparation of plans to meet these needs.
2. Consultation with local communities as to the size and design of hospitals needed and as to the requirements of staffing and operation.
3. The approval of individual projects. I wish to make it clear that the selection and approval of projects within the state is a function of the state, and not of the Federal government.
4. Improvement in the quality of hospital service through licensure regulations.

STATE EMPHASIS VERSUS NATIONAL EMPHASIS

The sixth and last question proposed is, "Should emphasis be more at a local level (in this instance meaning state), or national level?" In my opinion, the present balance of emphasis and responsibility is ideal. The more important of the state responsibilities I have just mentioned. Federal responsibilities are limited to such broad considerations as are necessary to keep a consistent approach throughout the nation; this includes the approval of state plans and the approval of architectural plans, as well as expert consultation on any and all phases of the program as may be required by the states. The approval of architectural plans, incidentally, is, in my opinion, one of the most fruitful products of the Hill-Burton Program. Although many hospital administrators, and architects in particular, viewed this move with some apprehension in the beginning, they are now all staunchly behind the United States Public Health Service architectural regulations. In answer to an additional question, "Has it been wise to turn hospital design and utilization over to lay personnel?" I wish to make it completely clear that the pattern of hospital planning, design, construction, utilization, and administration under the Hill-Burton Program is in nowise different from that which prevailed before or which prevails now in hospitals in no way connected with the Hill-Burton Program, except for better surveys of need and better planning, design, and construction of the hospitals under the program. Otherwise, these functions are carried out by the same types of individuals as in the past. If there is any discernible difference, it is that more, rather than less, medical thinking has gone into the design of hospitals.

COMMENT

I am thoroughly in favor of the Hill-Burton Hospital Survey and Construction Program, both in principle and practice. It is true that some of us who work in larger cities would have liked to have had more help for our hospitals from this source. We realize, neverthele the basic purpose of the program is not to build mo in the larger metropolitan centers until the rural were more nearly satisfied. We are all hopeful, ho that the program will be continued and that even when the rural needs have been more nearly satisfi will be able to get assistance for the expansion teaching facilities. Both the Federal and the state a ities are fully aware of the vital importance of the ing institutions in maintaining the flow of doctors, and other personnel into our hospital system. They looking forward to meeting that need just as soon cumstances will permit.

All of us in the hospital field who have a special est in this program have been happy to note th American Medical Association has actively sup it from the very beginning. Only a few months ago, the possibility of increasing the annual approp from 75 million dollars to 150 million dollars was consideration, the American Medical Association' islative Committee vigorously supported this actio

CONCLUSION

In conclusion, the Hill-Burton Program is of s portance to our entire medical economy that its c understanding and full support are warranted by one who is concerned with bringing better healt American people.

MATERNAL AND CHILD HEALTH PROGRAMS

George A. Silver, M.D., New York

Maternal and child health programs really need to be discussed in relation to public health programs in general, since they represent phases, although important phases, of general public health activity. Public health begins when certain conditions exist: First, medicine accepts a theory of rational causation of disease, indicating a point of application for preventive measures. Then scientific methods become available for the prevention, amelioration, or cure of disease. Finally, the community accepts responsibility for the distribution of appropriate services. Health departments and their programs take their origin and growth from these three principles.

A hundred years ago maternal and child health programs were unknown. It took the combined efforts and persistence of Simon, Southwood Smith, Pasteur, Semmelweis, Jacobi, Holmes, Baker, Rotch, and Franklin Roosevelt to establish the foundation on which modern programs of mother and child care rest. Public health operations in the child health field antedated those in maternal health, for a number of reasons. Concern for the mother was reflected in improvements of hospital conditions and facilities and education of physi eliminate the risk in delivery itself. The success o and earlier antiseptic techniques in reducing risk obscured other factors contributing to mater tality susceptible of antepartum control. Besides in childbirth was accepted—the possibility of c without danger had to await acceptance of preg the summer months.

Developments in pediatrics, on the other hand, almost immediately to techniques of preventi shocking infant mortality rates, with the conce of infant deaths in the summer, gave sharp im preventive thinking. New York City in 1907 infant mortality rate of 145 in January and August.[1] Infectious disease caused one-half th deaths at that time, and the classification "diarrh resented practically the whole of the excess mor a physiological function.

The first baby health station was established Josephine Baker in 1908 in New York City. This public health function was preceded by priva dowed milk stations in Paris in 1892 and in Ne in 1898. The purpose of the baby health station o was to provide clean milk, modified formulas, and tion.[1] In the growth of these stations, as w clinics, child health conferences, or what you original purpose has not been lost or abandone

nuted to meet changing needs. By definition today, ll-baby conference concerns itself with general ı supervision of all infants and preschool children emphasis on (1) prevention of communicable dis- (2) establishment of sound nutrition and good habits, (3) emotional adjustments of mother and (4) providing correction of physical defects and tion of incipient deformities.[2]

e care of the pregnant woman and the provision of tal services grew naturally out of child health serv- ıs a means of reaching the mother before the child orn. In this way it was hoped to reduce prematurity ch caused 30% of infant deaths), to make the er aware of her child's needs early enough to assure ery of a sturdy, healthy infant, and to wipe out con- ıl syphilis and reduce maternal mortality. In the in- ning years infant mortality has been reduced to a on of what it was and maternal mortality reduced to finitesimal part of previous devastation (Tables 1 [3]). "From 1930 to 1945 deaths from diphtheria ed from approximately 15 to 4 per 100,000. The rate among preschool children has declined from ximately 20 deaths per 1,000 population in 1900 . approximately 1 in 1945."[4] Obviously the public h programs of maternal and child care did not of selves produce the results that were accomplished. ıe filtration and chlorination of community water lies, the installation of community sewage-disposal ms, pasteurization of milk, increasing availability utilization of hospitals for delivery (90% of Balti- 's babies were born in hospitals in 1949), all oper- during the same period of time as the maternal and health programs, played major parts in this mag- nt achievement. Certainly the discovery and wide f antibiotics more recently contribute heavily to the . However, the immunization programs, stimulated encouraged by the child health centers, did their too. It has to be pointed out in this connection gh, that in the most recent report on child health es (for the years 1945-1946)[4a] it is stated that only of the total volume of child care is given by health cies and only 6% of infants and preschool children ve any services at all from the well-child conference.

aths in first year of life per 1,000 live births.

nder the circumstances, one cannot assess properly role that maternal and child health programs have ed and continue to play in the prevention of disease the postponement of death. But there can be no t that by example and demonstration these programs brought home to the people and the practicing ician the kind and quality of service that is neces- for good preventive medicine. In the development of programs emphasis has shifted from the obstetrician's goal of hospital delivery for every pregnant woman, for example, to adequate prenatal supervision for every pregnant woman. Well-child care has moved from the early emphasis on feeding (really sanitation considerations) to emphasis on immunization and prevention of communicable diseases other than diarrhea, a fairly complete program of health supervision, and a concern for the emotional and social well-being of the child in addition to the physical.

TABLE 2.—*Maternal Deaths by Broad Cause Groups, Baltimore, 1925-1929 and 1945-1949*

Total	100.0	5.3	100.0	1.06

* Maternal deaths per 1,000 live babies.

In view of these facts, how can existing programs be evaluated? First of all, it must be recognized that the general rate of decline in the mortality rates has not been equal for all classes of Americans or in all areas. While rural residents are beginning to share the advantages of modern life, their health record has not kept pace with the record of urban dwellers. "Children in or near cities receive 50% more care than those in isolated counties."[4] Typhoid fever, malaria, and hookworm are predominantly rural diseases. Infant mortality in cities of 100,000 or more in 1948 was 28.9 and in places of 2,500 to 10,000 population, 36.[5]

Another significant differential mortality rate is evidenced in the distinct disadvantage of the Negro. The white infant mortality rate for 1948 was 29.9 (26.6 in cities of 100,000 or more) and the nonwhite rate 46.5 (56.3 in places of 2,500 to 10,000 population).[5] The striking disparity between the infant mortality rate of the white city dweller and the nonwhite small-town dweller (26.6 as compared with 56.3) should give pause to any premature self-congratulations. Finally, there is the economic differential, which militates against equality of care or service for the low-income groups. The percentage of hospital births and correlated infant and maternal mortality is associated with availability of facilities.[6]

Over 70% of children registered in Baltimore City Health Department well-baby clinics were Negro in 1949,[7] although only 20% of the population is Negro. Here low income and the pattern of segregation both play a part. Few, if any, Negro children in the eligible age group receive any well-baby care other than in city clinics, yet the number of Negro children seen in these clinics is only a fraction of the children in that age group. And what of those parts of the country not so liberally supplied with health department services as Baltimore? In isolated rural communities of Maryland only one-third as many children receive well-child care as in metropolitan adjacent counties.[8]

[7] Baltimore City Department of Health, 135th Annual Report, 1949.

Whatever deficiencies programs of this sort have, they stem mainly from the unfortunate traditional separation of care for the well and the sick. In practice today two sets of people are concerned with the child, generally in no contact with one another and without real knowledge of the whole child. The ideal goal, unification of child care, is to have one physician or a group of physicians undertaking complete supervision of the child in health and disease. The programs that now exist, however, are necessary for all the reasons that have been given: technical separation of care and sectional, economic, and rural deficiencies. The existing programs will continue until physicians develop the same enthusiasm and qualify themselves for health supervision as they have developed and qualified for in care of the sick.

Ultimately, the preventive medicine minded practitioner will assume the physical and emotional supervision in the field of maternal and child health in his office or in a group-practice center. By giving parents guidance and support, he may reduce the need for so many public health clinics or conferences. Right now three-fourths of private medical care of children is in the hands of general practitioners.[4a] The preventive medicine minded practitioner of the future, whether he is a generalist or specialist, will have to be oriented in the field of health promotion and disease prevention and not tied to therapeutic medicine as completely as he is today. The sectional, racial, and economic groups underprovided for now and in need of community service progra have been fitted into the private practitioner's through necessary organizational changes. Unt time, however, the prenatal and the well-baby clini continue to provide and extend existing services. In B more last year as many women went without p care at all as were seen in the Health Department c

In a period of crisis and clash of arms, when good p ical and emotional development of children is of th most importance, value and priority of programs as increasing weight. Three questions will have to be a and answered: 1. Why are we doing this? 2. Are we d it well? 3. What else should we do?

Both local and national officials bear responsibili the future development of maternal and child health p grams. Milk and water sanitation cannot be dissoci from child hygiene. Availability of hospital beds a training of obstetricians cannot be divorced from ternal-care programs. Since maternal and child h programs are aspects of total public health prog interdependent and having no really independent e ence, for planning purposes, national organization is viously necessary. Without national assistance local grams tend to be chaotic and to run off into chann lesser importance, and communities with the gr need have the least resources. Thus, on a national consideration can be given varying public health in different parts of the country and assistance adj in accordance with those needs and the ability specific community to meet them. However, pro need to be supported, encouraged, and strengthe the local level. Without local interest and local su public health programs have no reality and fail to trate into the depths of local need.

TREATMENT OF RHEUMATOID ARTHRITIS WITH NITROGEN MUSTA

PRELIMINARY REPORT

C. Jiménez Díaz, M.D., E. López García, M.D., A. Merchante, M.D.
and
J. Perianes, M.D., Madrid, Spain

One of us (J. D.)[1] recently reported the initial results obtained in the treatment of rheumatoid arthritis with nitrogen mustard. It was believed that this treatment might well be useful because of the well-known effect of cortisone and corticotrophin (ACTH), since, in the similar effects they produce, a certain relationship could be seen to exist between these hormones and nitrogen mustard.

It is a fact that one of the most constant eff nitrogen mustard, observed in the treatment of kin's disease, is the progressive decrease in lymph —they may even disappear completely—and t crease in the eosinophils. The same results can a obtained with the hormones ACTH and cortison the other hand, Chanutin and Ludewig[3] have d strated that the suprarenal cortex undergoes a plasia when acted upon by vesicating substances. Karnofsky and his colleagues[4] have reproduced toms similar to those of the "alarm" syndrome they have used nitrogen mustard. Recently, Betz, ghem and Lecomte[5] have also reported on the a hyperplasia and the increase in 17-ketosteroids wi use of nitrogen mustard.

2. Dougherty, T. F., and White, A.: Science 98: 367, 1943. Thorn, G. W., and others: New England J. Med. 241: 529, 1949.
3. Chanutin, A., and Ludewig, S.: Endocrinology 38: 376, 1946.
4. Karnofsky, D. A.; Graef, I., and Smith, H. W.: Am. J. Path. 24: 275, 1948.
5. Betz, H.; Heusghem, C., and Lecomte, J.: Rev. belge de pathologie et medicine experimentale 19: 251, 1949.

n the first place, two patients with rheumatoid arth- ; were treated; both cases were chronic and had been ted by different methods, especially by chrysotherapy the association of desoxycorticosterone (doca®) ate U. S. P. and ascorbic acid, with negative results. patient had been suffering for 11 years during the five of which she had been bedridden with extremely ful swelling of the knees, ankles, and finger joints. re were no obvious results after the first injection of g., apart from stopping a diarrhea that had persisted several months. The second injection, on the other d, produced an astonishing effect: the patient's con- on was rendered almost painless, the joint swellings e reduced considerably, she began to move her limbs fingers, and she rose from her bed and could walk. m the fourth injection of this course of treatment the ful symptoms disappeared except for a slight ache in knee, but the patient could move her arms and legs perfect ease. When she was seen one month later, condition was still satisfactory.

he other patient had simultaneous ankylosis of the joints and lumbar part of the spine and painful swell- at the other joints, which rendered him immobile. too, became free of pain at the second injection, and could move his previously swollen joints, although, as to be expected, the bony ankylosis of the hips and bar part of the spine remained unaltered. He did, vever, recover all movement of the arms, wrists, and er affected joints.

The results were still evident when he was seen two nths after the treatment had been stopped.

ince we treated these two patients we have tried the e procedure on seven more. The spectacular results ained in the first patient, with disappearance of pain of the exudative phenomena, as well as the recovery oint movements, have been achieved in four patients, le in two others the improvement has been less ob- us owing, as in the second case, to bony ankylosis or versible muscular retraction. In the remaining patient re has been improvement only insofar as the pain has ppeared and the exudative phenomena have re- ssed.

o far we have had no opportunity to treat patients h cortisone and cannot say if its effects are more rked than those we have observed with the use of ogen mustard, but we should think it difficult: we e never obtained such results with any of the other rapeutic measures that we have employed up to the sent. The effects of nitrogen mustard on rheumatism allel those on the blood cell count; the fall in eosino- ils from an initial count of 100-200 to values of 20-50 usual after approximately the third injection and is n greater in cases in which the drug's effect is more ense. The sedimentation rate increases initially and n falls, but we have never seen it come down to nor- l. The elimination of 17-ketosteroids in urine is in- ased during treatment.

Inspired by certain similarities, we have begun to ap- nitrogen mustard in cases of prolonged status asth- ticus. The first patient we saw had been in a sorry plight for the past three months before examination. For the last few nights she had not been able to lie down, and in the daytime she had to have several injections of epinephrine U. S. P. (adrenalin®) and ephedrine U. S. P. The night after her first injection of nitrogen mustard she found herself greatly improved and was able to sleep comfortably. On the following morning she had no asthmatic symptoms, and all palliatives were suspended. After the second injection she felt perfectly well and, at this writing, still does. Her eosinophil count dropped from 200 to 50 after the first injection. The second patient was not so seriously ill, but she had constant dyspnea and a persistent cough with diffuse breath sounds. After the first injection her dyspnea, cough, and auscultatory signs disappeared.

It is still much too soon to be able to draw conclusions as to the potentialities of this therapeutic measure, but we maintain that the dramatic results obtained in five, and the great improvement in three, out of nine patients treated so far are sufficient justification for drawing attention to the treatment so that its effects can be checked by other observers. The results obtained in our two asthmatic patients confirm the versatility of nitrogen mustard in that its action can be extended to the same diseases as that of ACTH. Green [6] has recently pointed out the relation between the activity of these hormones and their antimitotic action, and this would be a further argument in favor of this hypothesis insofar as both ACTH and cortisone have an antimitotic, lympholytic, and eosinopenic action.

We have a large number of patients under treatment at the present moment and hope soon to be able to give a detailed report on our observations.

SUMMARY

A report is given on the remarkable results obtained with the use of nitrogen mustard in the treatment of rheumatoid arthritis. Of nine patients treated, five improved extraordinarily, with complete disappearance of the pain and swelling of the joints and recovery of normal movement. In three other patients the ensuing improvement was considerable, even though not so complete. Two patients with status asthmaticus were also treated, the dyspnea disappearing after the first injection.

Prevention of Mumps.—Results indicate then that immunity to mumps can be induced by subcutaneous vaccination with inactivated virus, that the resistance thus produced is transitory; and that the duration of immunity depends on the height of the antibody level attained. From these suggestions it is likely that more extensive protection may be achieved if the interval between vaccination and exposure is less than nine months, but whether it will be possible to immunize in the face of an epidemic in order to prevent further generations of cases or to abort the disease in individuals vaccinated shortly after exposure remains to be ascertained.—Gertrude Henle, M.D., and Werner Henle, M.D., Studies on the Prevention of Mumps, *Pediatrics,* July, 1951.

RUPTURE OF CORPUS LUTEUM WITH PRODUCTION OF HEMOPERITONEUM

REPORT OF NINETEEN CASES

Tokuso Taniguchi, M.D.
and
George S. Kilkenny, M.D., Milwaukee

Hemoperitoneum resulting from rupture of a corpus luteum is not an uncommon condition, although the total number of cases reported in the literature is relatively small. In the majority of these cases erroneous preoperative diagnoses, such as acute appendicitis, ruptured extrauterine pregnancy, and salpingitis, were made. Morton,[1] in 1931, collected 26 cases of ruptured corpus luteum and found that in all of them the condition had been misdiagnosed. In none of the 11 cases of ruptured corpus luteum reported by Kretzschmar and Arnell,[2] in 1936, was the condition recognized preoperatively. Likewise, an erroneous diagnosis was made in the 10 cases of bleeding corpus luteum reported by Israel,[3] in 1937, as well as in the 15 cases reported by Pecman [4] and the 12 cases reported by Weil.[5] In our series, of 19 cases, a correct diagnosis was established in only one. This preponderant error in diagnosis is probably due to the lack of appreciation of the clinical entity of ruptured corpus luteum. While follicular rupture, better known as *Mittelschmerz,* is well recognized, it seems that corpus-luteum rupture is seldom considered as a possibility.

In an attempt to reevaluate the symptoms and physical findings in patients with ruptured corpus luteum and to bear out some of the pertinent data on the subject, the following study was undertaken.

The material is from the department of gynecological surgery of St. Joseph's Hospital in Milwaukee, covering the period from January, 1944, to June, 1950. During this period there were 19 patients with intraperitoneal hemorrhage resulting from rupture of the corpus luteum. In all these patients the ovarian lesion was confirmed by microscopic examination of the specimen submitted to the laboratory.

ANALYSIS OF CASE HISTORIES

The ages of the patients ranged from 13 to 45 years (Table). Three patients were under 20; 11 were between 20 and 30; four were between 30 and 40, and one was over 40. The average age was 26. Seventeen were married, and two were single. Most of the patients had not been pregnant or had borne but one child. Eight were nulligravid and nulliparous; five, primigravid and primiparous; three, secundigravid and primiparous; one, secundigravid and secundiparous; one, trigravid and nulliparous, and one, quadrigravid and quadriparous.

The menstrual history revealed that 13 patients h
regular periods up to the onset of the ovarian ruptu
and four, irregular periods. Patients with regular perio
had cycles of 26 to 30 days except one, who had a 3
day cycle. Two of the patients were pregnant at the ti
of rupture—the gestation period being two months f
one and five weeks for the other. Rupture of the corp
luteum occurred anywhere between the 16th day of t
cycle and the first day of menstruation, in the majori
occurring between the 18th and the 24th day. In t
patient with the 35-day cycle, rupture took place on t
first day of the flow.

Clinical Findings.—The blood pressure taken on t
patient's admission showed slight hypotension in a f
cases, while in the majority it was within normal lim

The pulse rate ranged from 72 to 110 a minute, w
an average of 87 a minute. The temperature was nor
or only slightly elevated in all the cases. The hig
temperature was 99.6 F.

Moderate anemia was seen in a number of patie
The red blood cell count ranged from 3,370,000
4,990,000 per cubic millimeter, with an average
4,070,000. Nine of the patients had a count be
4,000,000. The leucocyte count was within normal li
in 12 patients and moderately elevated in seven patie
ranging from 10,550 to 23,050 per cubic centim
The differential cell count was not significantly alte

Pain was a constant symptom in all the patients
varied in intensity with each one, *depending* upon
amount of hemorrhage. The pain was characteristic
sudden in onset and was usually confined to the lo
part of the abdomen. In 12 patients the pain was
initely severer on the right side. In one of the patients
abdominal pain was generalized and radiated up
the shoulder.

The hour of day varied at which onset of pain occur
In four patients the pain developed early in the mor
and awakened them from sleep, and in one the
occurred suddenly during intercourse. The pain in sev
patients was characterized as cramping. Two pati
had the pain intermittently for two to three days be
it became severe enough for them. to seek admissio
the hospital.

Nausea was a common symptom and was presen
14 patients. On the other hand, vomiting was uncom
and was present in only two patients. Backache wa
minor complaint and was present in five patients. Dys
and urgency of urination following the ovarian rup
were noted in three patients.

The abdomen was soft, flat, or only slightly disten
Tenderness in the lower part of the abdomen wa
constant finding. It was more pronounced in the r

s in six patients. Rebound tenderness was recorded eing present in six patients.

he time from onset of the abdominal pain to surgical rvention varied from 12 to 96 hours. In 12 patients ical operation was performed within the first 24 rs; in five patients, within 48 hours, and in two pa- ts it was delayed as long as four days. Fifteen of the ents walked into the admitting room of the hospital, four were brought in by wheel chair.

reoperative Diagnosis.—A preoperative diagnosis of ured corpus luteum was made in only one case. This ect diagnosis was established by a physician who had an opportunity to see a similar case previously and cognizant of the clinical entity of corpus-luteum ture. A diagnosis of acute appendicitis was made in cases, of ectopic pregnancy in three cases, of cystic ry in two cases, and of endometriosis in one case.

perative Procedure and Findings.—With a pre- iderant diagnosis of acute appendicitis, a gridiron or Burney incision was employed in 11 patients, a mid- suprapubic incision in seven patients, and a right tus incision in one patient.

ree blood was present within the peritoneal cavity ll the patients. It varied in amount from a few cubic timeters to "an abdomen full." In most of the patients, blood was confined to the pelvic cul-de-sac, in others vas generalized. Active bleeding from the ruptured pus luteum was still present in several of the patients he time the abdomen was opened.

Clinical Data on Nineteen Cases of Ruptured Corpus Luteum

The right ovary was found to be ruptured in 14 patients and the left in five. All the lesions were cysts or hematomas of the corpus luteum which varied from 2.0 to 4.2 cm. in diameter. Oophorectomy was performed in 13 patients; resection of the cyst, in three; salpingo-oophorectomy, in two, and simple closure of the rent with mattress suture, in one.

Abortion occurred in one of the pregnant females (Case 10; Table) after oophorectomy. It was necessary to extirpate the entire ovary in this case because there was strangulation by torsion of the pedicle, in addition to the rent present in the corpus luteum, from which active bleeding was taking place. In the other pregnant woman (Case 16; Table) gestation was uninterrupted after oophorectomy.

The appendix, together with the ovary, was removed in 13 patients and was not removed in one. Five of the 19 patients had had an appendectomy previously. Of the 13 appendixes, acute inflammation was found in two of them, and a fecalith in three of the uninflamed appendixes.

PRESENTATION OF CASES

Three representative cases of ruptured corpus luteum are presented.

M. A. (Case 14; Table), an unmarried woman aged 26, was admitted to St. Joseph's Hospital on Jan. 6, 1950, with the chief complaint of constant pain in the lower portion of the abdomen of 12 hours' duration. The pain occurred suddenly early in the morning. It was felt at first around the umbilicus and then shifted to the lower part of the abdomen. She experienced no nausea or vomiting. There was no change in the bowel habit and no urinary disturbance. Her last menstrual period was on Dec. 16, 1949. Periods had been regular and occurred every 28 days.

Physical examination showed the patient to be alert, cooperative, and in no acute distress. The temperature was 99 F.; the pulse rate, 110 a minute; the respiration rate, 22 per minute, and the blood pressure, 120/80 mm. Hg. The abdomen was soft, flat, and nonrigid. However, diffuse tenderness was present in the lower part of the abdomen. Rebound tenderness was also present. The bowel sounds were not unusual. No mass was palpable in the abdomen.

The hemogram showed 78% hemoglobin, 4,120,000 erythrocytes, 16,000 leucocytes, 6% stab neutrophils (band forms), 60% segmented neutrophils, 27% lymphocytes, 5% monocytes, and 2% eosinophils. The urine was normal.

A diagnosis of acute appendicitis was made, and the abdomen was entered on the right side through a gridiron incision. A considerable amount of free blood was found in the peritoneal cavity. The incision was extended downward to the symphysis pubis. A large hematoma of the corpus luteum, about the size of an orange, was found on the left side. Fresh blood was seen oozing through a rent in the wall. The right uterine adnexa were not unusual. A salpingo-oophorectomy was performed on the left side. The appendix was also removed.

The postoperative course was uneventful, and the patient was discharged on Jan. 14.

In this case, the clinical picture was strongly suggestive of acute appendicitis, especially in view of the initial site of the pain and the elevated leucocyte count. However, the absence of abdominal rigidity in the presence of tenderness and rebound tenderness was not consistent with such a diagnosis.

R. L. (Case 17; Table), a 30-year-old woman, secundigravid, secundiparous, entered St. Joseph's Hospital on May 17, 1950, with the chief complaint of having a constant pain in the lower portion of the abdomen. The pain had occurred suddenly that morning at about 6 o'clock and continued throughout the day, although the severity diminished slightly after the onset. She became slightly nauseated but did not vomit. There was no change in the bowel habit or any urinary disturbance. Her last menstrual period was on April 26. Periods had been regular and occurred every 26 days. She had no intermenstrual bleeding or discharge.

Physical examination revealed a well-developed, well-nourished woman, who did not appear acutely ill. The abdomen was soft, flat, and nonrigid, but diffuse tenderness was present in the lower portion. Tenderness was slightly more pronounced on the right side. Rebound tenderness was also present. The bowel sounds were normal. A bimanual pelvic examination revealed pronounced tenderness in the right uterine adnexa. While no definite mass was palpable, the right adnexa were felt to be slightly enlarged. The uterus was normal in size, shape, and position.

The blood pressure was 120/80 mm. Hg, the pulse rate 80 a minute, the respiration rate 20 a minute, and the temperature 98.8 F.

The hemogram showed 3,680,000 erythrocytes, 8,800 leucocytes, 1% stab neutrophils, 75% segmented neutrophils, 21% lymphocytes, 1% monocytes, and 2% eosinophils. The sedimentation rate was 20 mm. in one hour. The urine was normal.

A tentative diagnosis of acute appendicitis, and possibly disease of the uterine adnexa, was initially entertained; however, after reevaluation of the signs and symptoms presented by the patient, the diagnosis was changed to that of ruptured corpus luteum with intraperitoneal hemorrhage.

On exploration, a large amount of free blood was found in the peritoneal cavity. The right ovary was cystic, enlarged to the size of a tangerine, and filled with clotted blood. Free bleeding was present from a large rent in the cyst wall. The hematoma was evacuated; the lining was enucleated, and the collapsed wall was sutured with atraumatic® absorbable surgical suture U. S. P. The left adnexa were normal. Before closure of the abdomen, the appendix was extirpated as a *routine* measure, although not appear grossly abnormal.

The pathologic report was (1) ruptured corpus-luteum cy (2) subsiding appendicitis with periappendicitis.

The patient made an uneventful recovery and was disch on the seventh postoperative day.

The clinical picture in this case was fairly typic that of a ruptured corpus luteum. The sudden ons lower-abdominal pain during the second half of menstrual cycle in a woman whose periods had b regular was suggestive of a ruptured corpus luteum. T soft, flat, nonrigid, but tender abdomen, with def rebound tenderness, was strongly suggestive of free bl in the peritoneal cavity. The coexisting inflammation the appendix, although an incidental finding, emphas the importance of removing the appendix whene possible.

G. K. (Case 18; Table), a woman aged 26, entered St. Jos Hospital on Feb. 7, 1950, with the chief complaint of recu pain in the lower portion of the abdomen, of two days' dura The pain occurred suddenly on Feb. 5 and subsided after a two hours, but tenderness persisted. The following day the recurred, lasting for several hours, and its severity then ab Slight nausea and vomiting accompanied the pain. There no urinary disturbance or change in the bowel habit. Her menstrual period was on Jan. 1. Periods had been regular occurred every 28 days.

Physical examination revealed an asthenic woman wh peared ill but in no acute distress. The abdomen was soft, and nonrigid. Tenderness was present in the lower part o abdomen, especially in the right hypogastric region. There pronounced rebound tenderness. Borborygmi were slightly h active. The blood pressure was 100/65 mm. Hg; the pulse 80 per minute; the respiration rate, 22 per minute, an temperature, 98.0 F.

The hemogram showed 88% hemoglobin, 4,990,000 ery cytes, 19,950 leucocytes, 7% stab neutrophils, 86% segm neutrophils, and 7% lymphocytes. The urine was normal.

A diagnosis of acute appendicitis was made, and a incision was made on the right side. A large amount of blood was encountered in the peritoneal cavity, and the in was extended downward. As the free blood was aspirated, c blood was found in the pelvic cul-de-sac. The right ovary enlarged to the size of a hen's egg and was filled with dark b There was bleeding from a rent in the ovary. Salpingo- tomy was performed on the right side. The appendix was removed.

The patient made an uneventful recovery and was disch on the eighth postoperative day.

This case was atypical in that the pain was pr intermittently for two days and there were nausea vomiting. Apparently, the ovarian bleeding took intermittently. The elevated red and white blood counts may be attributed to hemoconcentration prod by the nausea and vomiting. The physical findings of abdomen—flat, soft, nonrigid, but tender abdomen rebound tenderness and normal borborygmi—were gestive of free blood in the peritoneal cavity, rather of appendicitis.

COMMENT

While rupture of the Graafian follicle is a nor process in the ordinary cycle of ovarian activity, rup of the corpus luteum is pathological and is accompan with active bleeding. The formation of a hematoma a cyst in the corpus luteum is known to be an import predisposing factor in the causation of the rupture, inciting factor producing the rupture is frequently icult to evaluate. Rupture is known to have occurred ing sleep,[3] during coitus,[6] during the performance of linary activity,[7] after an abdominal blow,[8] and during ianual pelvic examination.[9] Whatever the inciting ise may be, an increased intraluminal pressure in the pus luteum, whether produced from within or with- , seems to be the fundamental cause of the rupture. our series, rupture occurred during sleep in four pa- its, during coitus in one, and during the performance ordinary activity in 14.

The formation of corpus-luteum hematomas occur h much more frequency than is generally believed.[10] e majority of them, undoubtedly, undergo resorption hout clinical recognition. A few, however, go on to ture. Even with rupture, if bleeding is mild and is of rt duration, hemorrhage may go unrecognized. Fur- rmore, with moderately severe hemorrhage, bleeding y cease spontaneously and recovery take place without gical intervention. Unfortunately, the incidence of se cases is entirely unknown, for without surgical loration the diagnosis in such cases is a matter of jecture. In several of the cases here reported, bleeding s found to have ceased by the time the abdomen was ned.

Rupture of the corpus luteum may occur at any time ing the child-bearing period, from the onset of puberty the menopause, but most commonly occurs in the ing adult. Rupture has been reported to have occurred n after the onset of puberty. King and Hawes [11] cited ase in which rupture occurred in a 12-year-old girl, ose catamenia had begun one year previously. Foisie [12] cribed a case of a 12-year-old girl in whom rupture l exsanguinating hemorrhage occurred one month r the onset of the catamenia. Pedlow [13] reported a ilar case in a 12-year-old girl. These cases emphasize necessity of considering a diagnosis of ruptured pus luteum in the case of any female after the onset puberty.

The corpus luteum ruptures characteristically during second half of the menstrual cycle, and the Graafian icle, during the midinterval period. This time relation- p in the menstrual cycle is an important feature in erentiating rupture of a follicle and rupture of a pus luteum. Surveys by various investigators indicate t intraperitoneal hemorrhage is caused much more quently by rupture of a corpus luteum than by rupture a follicle. This preponderance of reported cases of pus-luteum rupture is partly explained by the fact t the resultant hemorrhage is much severer and more ductive of symptoms than that which accompanies licular rupture.

Clinical Manifestations and Physical Findings.—The st striking characteristic of corpus-luteum rupture is suddenness of the onset. The symptoms produced by rupture vary considerably with the amount of hemor- ige. Seldom is the bleeding severe enough to produce icture of shock. In order for the ovarian rupture to recognized clinically, sufficient hemorrhage must cur to cause irritation of the pelvic peritoneum. The iderness present in the lower part of the abdomen is st pronounced on the side on which rupture has taken ice. In the majority of the cases, the tenderness is most marked on the right side, owing to the comparative frequency with which rupture occurs in the right ovary.[14] In this series, 14 of the 19 patients had a rupture of the right ovary. Muscular spasm is rarely severe, and is frequently absent. Rebound tenderness can be elicited if there is sufficient free blood in the abdomen. Pain may be experienced in the shoulder if the blood extends up to the diaphragm and irritates the phrenic nerve. In contrast to the findings in acute peritonitis, peristaltic sounds are usually heard. A varying degree of nausea is present, but vomiting is usually absent. Only two of the 19 patients in this series experienced vomiting. A few of the patients experienced an urgency to defecate or urinate, and three of them had cramp-like pain on defecation.

A fulness may be palpable in the cul-de-sac on bimanual pelvic examination, but often the amount of free blood is insufficient to produce a mass. Adnexal tenderness is most pronounced on the side on which the rupture is present. The ovarian hematoma may sometimes be outlined as a soft, tender tumor.

The temperature is normal or only slightly elevated. There may be slight to moderate leucocytosis and anemia, depending upon the amount and duration of the hemorrhage.

While many of the aforementioned clinical findings might readily be associated with ectopic pregnancy, evidence of gestation in these cases of ruptured corpus luteum is strikingly absent.

Diagnosis.—An erroneous preoperative diagnosis, such as acute appendicitis, ruptured extrauterine pregnancy, or salpingitis, is made in the majority of cases of ovarian hemorrhage. A correct diagnosis can be established in an increased percentage of these cases if such an entity as corpus-luteum rupture is kept in mind in making a differential diagnosis of acute abdominal pain in any woman of child-bearing age. This is well borne out by a survey made by Hoyt and Meigs [14c] at the Massachusetts General Hospital, where 17 of 58 ovarian ruptures (follicular and corpus-luteum ruptures) were correctly diagnosed preoperatively by the house staff and surgical residents, who were on the lookout for such hemorrhage from the ovary. The sudden onset of symptoms of intraperitoneal hemorrhage, during the second half of the menstrual cycle in any woman of child-bearing age should lead one to suspect a rupture of the corpus luteum. To differentiate the condition from a ruptured

extrauterine pregnancy may be difficult at times, especially if the patient's menstrual periods have been irregular.

Operative Procedure.—In many of the mild cases surgical operation is not required, for bleeding frequently stops spontaneously after a period of oozing. The severity and progression of the symptoms should be the guide in the decision for operative intervention. However, needless to say, the danger of watchful waiting lies in those cases with a mistaken diagnosis in which an accutely inflamed appendix or other acute surgical condition of the abdomen exists.

The treatment of the ovary depends upon the amount of pathological change present. As much as possible, the affected ovary should be conserved. The simplest procedure is to evacuate the hematoma and approximate the collapsed wall with atraumatic® absorbable surgical suture. Resection of the ovary, or even oophorectomy, may be necessary if the greater part of the ovary is involved by the hematoma or if bleeding cannot be controlled.

Since dual lesions may coexist,[15] the appendix should be examined routinely and extirpated whenever possible, even though a definite pathological condition exists in the ovary. An acutely inflamed appendix, coexisting with a ruptured corpus luteum, has been reported by O'G man [16] and by Hoyt and Meigs.[14c] Such a dual lesion also found in this series of cases.

SUMMARY AND CONCLUSIONS

Nineteen cases of ruptured corpus luteum occur at St. Joseph's Hospital in Milwaukee in the period f January, 1944, to June, 1950, are reviewed. A co preoperative diagnosis was made in one case. In cases the condition was diagnosed as acute appendi in three, as ectopic pregnancy; in two, as cystic ov and in one, as endometriosis.

The clinical manifestations, diagnosis, and surg aspect of ruptured corpus luteum are discussed.

Ruptured corpus luteum is not an uncommon co dition.

A diagnosis of ruptured corpus luteum should be e tertained in any woman of child-bearing age with lo abdominal pain occurring during the second half of t menstrual cycle.

GENERAL PRACTITIONER'S ROLE IN MANAGEMENT OF PERSONALITY PROBLEMS OF ADOLESCENTS

William A. Schonfeld, M.D., White Plains, N. Y.

The general practitioner, who sees more adolescent patients than any other medical specialist, should accept he challenge which the problems of adolescence present. ecause of the continuity of contact with the child, and his parents and siblings, the general practitioner is in a favorable position to contribute both to the solution and prevention of emotional problems arising in this 13 to 18-year-old age group. This paper does not seek to offer a comprehensive psychological evaluation of adolescence but rather limits discussion to those problems which the general practitioner could manage within his limitations of time and training.

PERSONALITY PROBLEMS OF ADOLESCENTS

The beginning of adolescence [1] brings about very definite physical manifestations, but changes in personality occurring at this time are not so abrupt as is frequently thought. Personality and emotional disturbances evi during adolescence are usually a continuation or re vation of infantile and early childhood conflicts. At ti however, the stress of physiological and social dem may be more than some adolescents can handle, so th borderline adjusted child may have a turbulent ado cence.

I shall not discuss specifically such antisocial beha as alcoholism, narcotic addiction, thievery, "mugg sex crimes, use of "hot rod" cars, and the many major aberrations of behavior seen so often in ad cents. They are merely violent modes of expressio emotional needs or conflicts, or attempts at solutic these conflicts, and are basically combined social psychiatric problems. These problems are often bey the scope of the general practitioner, who should limi attention to the earlier evidences of conflict in the areas to be discussed.

Adolescent Turmoil.—What constitutes normal havior during adolescence? Unfortunately, there i specific answer. Young people arrive at adolescence varying degrees of self-esteem and self-approval, m concepts, and abilities to relate themselves to others to adjust to new situations. They run up against t basic challenges as result of physiological developm and social pressures: (1) need for "emancipation" f adult authority, (2) the sex drive, and (3) aggres drives to achieve and dominate. This occurs along the adolescent's need to be accepted and approved by agemates.

From the Department of Psychiatry, Columbia University College of Physicians and Surgeons.

Read before the Section on General Practice at the One Hundredth Annual Session of the American Medical Association, Atlantic City, June 13, 1951.

[1] Adolescence may be divided into three phases: prepubescence, pubescence, and postpubescence. Pubescence may be described as that phase of development which starts with the first appearance of terminal hair in the pubic region and terminates when the pubes is fully covered with hair. Prepubescence is that stage in which the penis and testes begin their spurt of growth in the boy and the breasts in the girl up to the point when pubic hair is first apparent. Postpubescence is the phase after hair is well developed until full maturity. The penis and testes grow progressively during all these phases. In the girl the breasts and uterus continue to grow throughout these phases, with menstruation usually beginning during the phase of pubescence. Puberty is defined as the point when the individual boy or girl is capable of procreating and need not correspond to the day of the boy's first emission or the girl's menarche. The period of childhood prior to adolescence may be called preadolescence and that following it postadolescence or maturity.

These challenges are usually in conflict with the child's lier concepts of proper behavior and the culturally epted patterns of behavior set up by parents and soci- , so that the adolescent must constantly choose be- en modes of action which depend on conflicting hes, values, attitudes, feelings, and beliefs. The ex- me contradictions of attitude and behavior which aracterize even the normal adolescent are expressions these conflicts and their search for acceptable patterns conduct. The resolution of these conflicts is the very ence of personality development in the adolescent and in area in which the physician can be of great help.

Problems Associated with Physical Development.— though deviations in physical development rarely affect havior directly, they do influence behavior by develop- anxieties that color or distort the child's experiences.[2] is is particularly a problem in adolescence when the sire to grow is changed to a desire to grow sexually propriate at a time when there is such a marked varia- n in the physical status of children of the same age, due the wide age range of onset of normal adolescence.[3] is this wide age range of onset of normal sexual matura- n and the associated growth spurt which create the parent deficiencies in development noted in this age oup, which are frequently erroneously attributed to docrine dyscrasia.[4] The issue of being approved or sapproved by others assumes a critical importance, so at anything which tends to make the adolescent feel adequate or inferior (such as a deficiency in height or condary sex characteristics) leads to feelings of anxiety d is likely to be met promptly with some kind of defen- e reaction. However, even more often, the manifest ncern over physical development is merely a ration- ization and projection of a more basic emotional de- ivation.[5]

Often boys or girls who mature physically earlier than eir contemporaries also present personality problems. his is due largely to the fact that the restrictions imposed th by society and parents are based on the child's ronological age, while the demands of the early- aturing adolescent are based on his physiological status, ars of maturity, and appearance. When associated with tellectual retardation, early physical maturity fre- uently leads to serious social maladjustment.

Disturbed Parent-Adolescent Relationship.—It is too mple either to blame parents for every personality dis- rbance manifested by adolescents or to absolve them om all responsibility and blame the adolescent. It is ore important to analyze the family interrelationships nd contradictions which create the problem.

This is a time for rebellion. The adolescent strives to scape parental domination only to be able to conform to e even more domineering mores of his agemates; yet, t the same time, it is important for him to have a feeling f acceptance and being understood by his family. Con- ant reminders that a boy or girl is "different" or admoni- ons that he should be more popular, effective, or onforming aggravate and add to the problem. The dolescent must also work out his hostilities and over- ttachments to his parents.

Frequently the child's disturbed behavior and feelings are his adaptation to the parents' own emotional problems. Parents may seek in their child compensation for an unhappy marriage, solution to emotional conflicts, or a counterbalance to disappointments in a vocational career, while others even resent their children. However, it must be remembered that many more parental shortcomings emanate from anxiety and confusion than from ignorance or malice, so that the physician can accomplish a great deal by helping parents look to their own problems and create wholesome relationships with their children.

Both boys and girls are greatly influenced by the "emotional climate" in the home created by the parents' attitudes toward each other, toward them, and toward society. A mother who makes a boy feel he is repulsive to girls or who passively clings to him, denying him the emotional freedom to direct his attention to girls, may handicap or block his psychosexual development. Likewise, the mother and father who do not help their daughter clarify and accept a realistic role in life may hinder her maturity. Confusion and conflict over the feminine role today create a pressing problem of anxiety and uncertainty in adolescent girls.

The rivalry and jealousy among siblings and the child's position in the family constellation are important factors in the family situation which requre a great deal of understanding.[6] Hostility and feelings of guilt are frequent emotional reactions of adolescents to problems in this sphere.

Problems of Social and Sexual Adjustment.—To become effective members of society, boys and girls must accept responsibility for self-direction and establish wholesome relationships with their own contemporaries. Parents must help them to achieve this independence.

As adolescence begins, the youngster begins seriously to evaluate himself in comparison with friends and classmates, not only in respect to physical appearance, as previously discussed, but also in respect to his intellectual capacities, interests, attitudes, needs, and personality. If he finds himself wanting, he may project his difficulties, blame others, and show uncontrolled and undirected hostile behavior when thwarted; or he may withdraw from social contacts, tending to give up in his struggle with life, often with the development of somatic complaints. It is a real dilemma, and the physician must use caution before even encouraging a youngster toward greater social activity until underlying problems are clearly seen. Withdrawn, shy youngsters are not helped when told to "go ahead and have a good time." It is essential to understand and deal with the basic personality problems which inhibit expression of instinctive gregarious needs. A diagnosis of schizophrenia is made too often of these disturbed adolescents, but when present it should be recognized early.[7] It is equally important to understand and manage the hostile and aggressive youth. Disturbances in sexual behavior and attitudes in adolescents are invariably an expression of a more generalized personality problem. However, inconsistencies in our social standards also create confusion as to the person's sex role, very often resulting in intense feelings of guilt and attempts to resolve the conflict through a variety of personality reactions including compulsive behavior, submissiveness, hostility, or withdrawal. Most adolescents learn to control, sublimate, or express their sex drives in socially acceptable patterns of behavior, but some do get into difficulties.[8]

Sex education is more than a knowledge of anatomic and physiological processes. It is an understanding of how to love and live with members of the same and opposite sex. To be effective, sex education must start
early childhood as questions arise and be part of
training in accepted cultural patterns of behavior
interpersonal relationships, and not left merely to a se
of lectures or movies during adolescence.[9]

Problems of Adjustment in School.—The phys
should do more than merely eliminate the physical
fects which may handicap the child. In cooperation
the school authorities, he should try to evaluate i
lectual and emotional factors which may be ca
failure. Failure in school is not always due to inf
intellectual endowment. In some cases it is due to
cific reading disabilities [10]; in others it is due to a
crepancy between the intellectual capacity and apti
of the adolescent and the demand of the high sc
curriculum or the ambitions of the parents. It must
be forgotten that in many cases failure in school is m
the expression of unsatisfied emotional needs, which
not be related directly to the school situation. Inal
to create wholesome relationships with agemates i

tion, or social pressures. Treatment may be directed ur areas—namely, the adolescent, the parents, the ol, and group activities.

ie Adolescent.—It is important for the physician sees an adolescent patient, whether for an illness or school examination, to include in his examination iistory a survey of the adequacy of the adolescent's , nutrition, and general activity as well as his adjust- to school, home, and his peers and to initiate such ges as may be indicated. Particular attention should iid to the emotional status of all adolescents who ss more concern than is justified about their physical h, normality, and physical attractiveness.[13] The cian who understands and even anticipates the diffi- s likely to arise because of irregularities in growth exual maturation can help parents and youngsters igh this trying period. He must, however, always mber *that concern over physical development may ther a cause of anxiety or merely a projection of a basic emotional problem.* It is just as wrong, then, e hormones indiscriminately as it is to send a mother with the comment "stop worrying, he will outgrow r that the young person "is just going through a e." Hormone therapy and remedial surgery have a limited place in the treatment of adolescents, al- gh specific indications do exist, usually as adjuvants sychotherapy.[14]

any adolescent behavior problems can be interpreted rms of conflict between the youth's desires and direct idirect environmental demands made on him. The ician should attempt to find a solution to the con- which will satisfy the young patient's needs and h will still meet acceptable social standards. He ld make certain that environmental pressures are nable and within the child's capacity to meet them, ne should work toward satisfaction of fundamental ional needs. The physician cannot promise to nate all friction, but he can offer to help the adoles- meet his difficulties, resolve his conflicts, and under- l the need to control his primitive impulses and thus great deal to obviate many of the personality prob- of adolescence and psychosomatic disorders of early t life. This cannot be accomplished through lecturing y helping the adolescent and his parents to marshal acts and evaluate them realistically. Unfortunately, any adolescents, like their parents, emotional blocks biases develop which prevent a realistic evaluation ie situation. In these cases only a deeper analytical oach will be of any help to modify the adolescent's tional needs and blundering attempts to solve his licts.

'herever possible, treatment should be carried on e the child is at home. Too often the military or ding school is the adult answer to adolescent prob- . "They'll teach him discipline," is the cry. Fre- itly, however, all they achieve is further repression ostilities, which subsequently become expressed in r spheres. Discipline to be effective must be self- osed. It can only be inculcated if the child has a feel- of being loved and a sense of belonging.[15] Decision as to whether the child remains or is removed from home is dependent on the ability of parents to accept their responsibility in the psychotherapeutic manipulation of *the home situation while therapy is in progress.*

Parents.—In dealing with parents the busy practitioner must learn to differentiate between two general groups. First, there are those who are well adjusted but do not comprehend their own mistakes. These parents can learn, accept suggestions, and follow directions with good judgment. Often they are misguided and overanxious about their children. With them a lot can be accomplished in a little time if the general practitioner understands the problem and advises them properly, not only in regard to specific behavior but, more important, in regard to helping them change their feelings and attitudes.

The second group of parents is infinitely more difficult to deal with. They are victims of their own maladjustments, frequently influenced by strong guilt and conflict over hostile feelings toward the child, which must be resolved before anyone can help the parent-child relationship. Parents as well as the adolescents need the sympathetic understanding of the physician. It is futile for the physician merely to assume an authoritative, critical, or disciplinary role with either. At times one finds that the root of the problem is so profound in either the mother or father that the only hope lies in adequate psychotherapy for the parent. Usually, however, it is possible to accomplish a great deal by working with the adolescent and guiding the parents. The goals in treatment are directed not only toward helping the parents handle the adolescent, but also toward teaching the adolescent how to handle his parents with the minimum of conflicts and the maximum of satisfaction to both.

School.—The physician who treats adolescents must work in close cooperation with the school authorities, both from diagnostic and therapeutic viewpoints. Most high schools have designated personnel to be in charge of student counseling who welcome the opportunity of working in close cooperation with the family physician.

The physician's understanding of the adolescent's and his parents' emotional needs and limitations may be of great help to the school counselor in formulating an appropriate academic or vocational training program for the individual child. In turn, the counselor by knowing of the child's limitations and potentialities can do a great deal to help the physician to relieve the tensions and anxieties by adjustment of the child's academic program.

Group Activities.—It is important for the general practitioner to help the adolescent and his family to find acceptable outlets for his energies through group activities. However, the question frequently arises as to how "to make" the adolescent join the community-sponsored or accepted projects, such as social clubs, scout movements, athletic teams, 4H clubs, or church groups, as opposed to the corner drug store, poolroom, dance halls, and cellar clubs. In joining a group, the adolescent identifies himself with this group, whether for constructive purposes or as an expression of revolt, and this is as much a symptom as an etiological factor in the behavior disorder. Before the adolescent can establish a wholesome group relationship, he must be able to relate himself to others as a person accepting his assets and liabilities. It is in this sphere that a physician could contribute most. In helping the disturbed adolescent to find a socially acceptable group to join, the physician and family should not try to force the adolescent into a pattern of behavior wholly unacceptable to him. They should try to take full advantage of the adolescent's aptitudes and interests and find a group in which he could find a place for himself, even if it is a compromise with the adult's concept of ideal activity, as long as it is in the right direction. The adolescent must also be taught to compromise.

Need for Referral to Psychiatrist.—In some cases psychotherapy must go beyond the point of environmental manipulation, encouragement, and guidance. It can only be achieved through a close interpersonal relationship of patient and psychotherapist in which the adolescent can live through his conflicts. This requires the specialized skills and techniques of the pediatric psychiatrist.

Adolescence is a promising period for psychotherapy. The teenager's personality, being dynamic and open to suggestion, is highly amenable to all external influences, including those of psychotherapy. The personality is still flexible in adolescence. If at this stage the adolescent's insight and awareness is widened, a solidifying of the personality into permanent patterns of maladjustment may be prevented. The approach varies with the individual case and the individual psychiatrist. But in all cases it is largely dependent for its results on a quick, strong, and successful transference. The therapist, by virtue of his skill and experience, quickly ascertains the nature and extent of the adolescent's affective distortions and emotional disturbance. He attempts to correct these by reweaving the patient's emotional life, retraining his reactions, reintegrating him to life, and helping him to find enduring interests, healthy sublimations, and strong compensations. The adolescent is also taught to recognize and accept the fact that frustration and a certain amount of accepted and tolerated emotional repression is a necessary part of civilized society. The adolescent must find a working knowledge of the nature of his emotions which helps him to comprehend the reaction patterns of his life. He must understand the more usual dynamic factors and psychological mechanisms influencing his reactions, and he must be taught how to deal with these factors in accordance with wholesome goals and purposes in life.

SUMMARY

The ever-increasing problems of adolescence ca
the cooperation and collaboration of all those inv
in the management of this age group, including the f
physician. The general practitioner must go beyo
adolescent's physical health and accept responsibili
helping to resolve the adolescent's emotional need
conflicts. The problems discussed are those asso
with normal adolescent conflicts, as well as the pro
associated with inadequate physical maturation an
occupation with physical health and sexual mal
ment, disturbances of intrafamily relationships, a
ficulties in school. Young people arrive at adole
varying in self-esteem, self-approval, feelings of
petence, and in the ability to relate themselves to
and to adjust to new situations. At this time th
confronted with three basic challenges, which are e
pation from parental authority, the sex drive, a
aggressive drives to achieve and dominate. The
of personality development in the adolescent is th
lution of the conflicts created by these new driv
emotional needs of maturity superimposed on th
personality pattern of the youngster in the pres
the frequently conflicting mores of parents an
adults with those of his agemates. Frequently, th
tional needs of the adolescent are not satisfied
pattern of behavior adopted as the solution for
flicts is not socially acceptable and leads to the
ances of behavior noted in teenagers. The physici
remember that the expressed concern is often r
rationalization and projection of a more bas
tional deprivation.

OCCULT CARCINOMA OF THE BREAST

William T. Fitts Jr., M.D.
and
Robert C. Horn Jr., M.D., Philadelphia

nsiderable emphasis has been placed on early osis as a major weapon in the fight against breast r, and, certainly, if breast cancer is detected early, vorable outcome may be expected. Follow-up s show that radical mastectomy for cancer perd prior to axillary lymph node involvement results ree times as many five-year survivals as when tion is delayed until the nodes have been invaded. fortunately, it is not always possible to detect t cancer early. The usual method of detection is the physicial examination. Although interesting imental work is being done in diagnosis by active phosphorus and roentgen rays, laboratory ods of detecting breast cancer preoperatively are et practical, and therefore it is necessary to depend st entirely on clinical examination.

the management of breast lesions, we have used concept of a "dominant lump" as introduced by gensen and Stout.[1] The term "dominant lump" is oyed by those authors to designate a circumscribed of breast tissue different in consistency from the ounding breast tissue. The early detection and imiate investigation of these circumscribed areas of st tissue is the chief hope of curing breast cancer r present limitations, and the only accurate method iagnosing a "dominant lump" is by excision for s and microscopic examination. In a series of 166 ninant lumps" removed surgically, one of us (W. T. compared the preoperative diagnosis with the final ologic diagnosis based on microscopic examination found that only 75% of our preoperative diagnoses correct.[2] It has been repeatedly demonstrated that e waits for the classical signs of carcinoma (nipple ction, skin attachment, and fascial attachment) to ar before a "dominant lump" is removed and ined, the chance of cure may be lost.

the clinical demonstration of a mass in the breast e most trustworthy indication of cancer, it is dising to learn that some breast cancers first manifest selves by other, and often more advanced, signs. son [3] recently reported three patients with carcia of the breast, each of whom had a palpable ary metastasis before the primary breast lesion d be felt. Cogswell,[4] prompted by Jackson's contion, reported a similar case, and several physicians discussed Cogswell's paper mentioned having seen ast one similar patient.

he concept of an occult carcinoma is not new, hav- been discussed by Willis [5] in "The Spread of nors in the Human Body," in a section on "Latent cinoma of the Breast." He refers to several reported [6] in which the first sign of disease was axillary or distant metastasis.

t the Hospital of the University of Pennsylvania have recently seen several cases similar to Jackson's Cogswell's, and have been stimulated by their reports to make a study of our experiences. We have reviewed all breast cancers examined in the Laboratory of Surgical Pathology in the last eight years from cases in which a mass was not palpated before operation.

So much reliance is placed on the discovery of a mass as the diagnostic criterion of breast cancer, that we believe it is well to give wider recognition to the occult carcinomas of the breast and their first symptoms and signs.

ANALYSIS OF CASES

During the last five years, 15 patients were operated on at the Hospital of the University of Pennsylvania for carcinoma of the breast that had manifested itself before a mass could be palpated. In a 16th case, breast carcinoma that had metastasized to the abdomen was discovered only at autopsy. The signs that led to the diagnosis of cancer are listed in the table. The recognition of a small dominant lump is a difficult and often an arbitrary diagnosis. What some examiners call a "lump," others may consider a normal variation. An experienced examiner may find a small "lump" in a breast that most physicians would pass as normal. It is entirely possible that some of the breast cancers in these patients might have been felt before operation. Suffice

it to say that physicians experienced in the examination of the breast were unable to detect a mass in these instances, even on repeated and careful examinations.

REPORT OF CASES

CASE 1.—A. B., a 51-yr.-old white housewife, had noticed a serous discharge from the right nipple for seven months before her admission to the Hospital of the University of Pennsylvania on April 25, 1947. She stated that occasionally the discharge had been "rust-colored" but never bloody. On examination serum was expressed from the right nipple but no breast masses were felt. A right simple mastectomy was performed on April 26 by Dr. F. L. Payne. By tracing a dilated duct in the center of the nipple, the pathologist exposed a hard, uncircumscribed lesion, 4.0 cm. beneath the nipple, which grossly resembled carcinoma and which proved on microscopic examination to be an intraductal carcinoma with minimal stromal invasion. Removal of the pectoral muscles and axillary contents was performed on April 30. Several axillary nodes contained metastases. In January, 1949, the patient noted a mass in the opposite breast. An excision biopsy on May 31 revealed carcinoma on quick-frozen section, and a left radical mastectomy was carried out. Microscopic study showed that the lesion from the left breast was a highly anaplastic carcinoma with invasion of adipose tissue and involvement of eight out of nine axillary nodes. The patient died March 30, 1950, with generalized metastases.

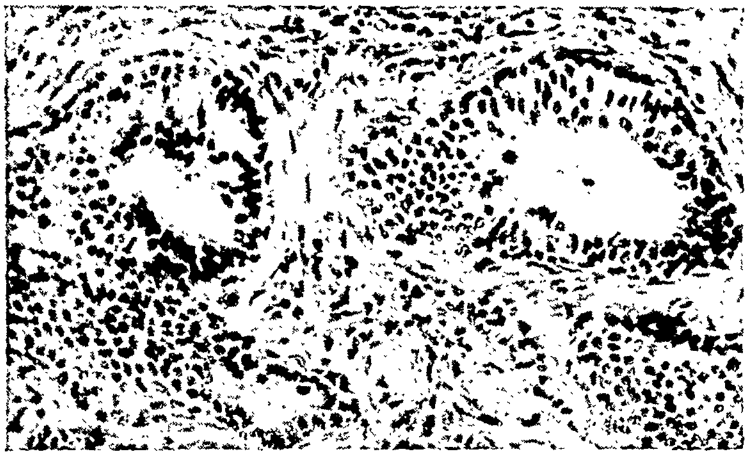

Fig. 1 (Case 4).—Atypical hyperplasia in mammary ducts. Hematoxylin and eosin; × 207.

CASE 2.—L. W., a 62-yr.-old housewife, was admitted to the hospital on Nov. 3, 1949, because of a muddy-red discharge from the left nipple first noted four weeks previously. Bloody fluid could be expressed from the nipple by pressure over the lower outer quadrant of the breast. No masses could be felt. Operation was performed the day after admission by Dr. H. P. Royster. A wedge-shaped segment of breast was excised, centering on a blood-filled duct located at the left lower quadrant. Gross and frozen-section examinations were suggestive of carcinoma but were not conclusive. The paraffin sections disclosed a carcinoma that appeared to be entirely intraductal. Radical mastectomy was performed on Nov. 7. Lateral to the biopsy wound was a nodule 2.0 cm. in diameter. Numerous ducts in the area of this nodule contained carcinoma cells. Thirty axillary lymph nodes were examined and were free of cancer.

CASE 3.—R. S., a 50-yr.-old white housewife, entered the hospital on June 9, 1950, because of a discharge from the left nipple of three years' duration. The discharge had been milky until several weeks prior to admission, when blood became evident in the fluid. No mass could be felt in the breast, but a discharge could be expressed from the nipple by pressure over several segments of the breast. A simple mastectomy was performed by Dr. F. L. Payne on June 10. No tumor mass could be identified grossly but microscopic examination revealed an intraductal carcinoma involving the ducts just beneath ple. Resection of the pectoral muscles and axillary con performed on June 16. None of 16 axillary nodes cancer.

CASE 4.—D. A., a 57-yr.-old Negro housewife, was to the hospital on Oct. 24, 1945, because of a bloody from the right nipple of six weeks' duration. Pressure ately caudad to the areola produced blood at the nipple masses could be felt in the breast. On Oct. 25 a wedge mary tissue was excised centering on the involved duct. Pathological examination disclosed a number of and dilated ducts, in some of which the epithelial unusually large and hyperplastic, occasionally forming papillomata. Although on subsequent examination papillomas were considered atypical, there was no cancer (Fig. 1). The changes were not striking, and it questionable whether they accounted for the bleeding.

Six months after operation the patient noted a mass scar but did not report to the follow-up clinic until after operation. At that time, examination disclosed a lateral to the scar, which was firm and lobulated and had retracted the skin. Excision biopsy performed 1946, by one of us (W. T. F.) disclosed a firm mass diameter, arising from a cyst wall. Microscopically was composed of intraductal papillary growths of cells cytology was definitely that of cancer and which far as the nipple. A radical mastectomy was performed of the carcinoma was intraductal. One of 29 axillary nodes contained metastatic carcinoma.

It is impossible to say definitely whether the lesion duced the nipple discharge, and that we believe was the first operation, was a cancer or was still a benign, precancerous, hyperplasia. The appearance of a mass six months after the first operation makes it seem the cancer was already present at the time of the first

Comment.—It is our opinion, based on a tailed study of nipple discharge,[7] that discharge is not normally associated with lactation investigated surgically, even though no breast be palpated. We believe that, usually, the or ducts can be identified preoperatively and excising a pie-shaped segment of breast with as its axis and the periphery of the breast as the lesion can be removed. If gross and examinations prove the lesion to be benign, the resection is usually sufficient.

Whether the discharge is bloody or nonbloody not alter the type of treatment. The discharge first case reported above was serous, despite been produced by a malignant lesion. considered by many authorities as a premalignant is often accompanied by a serous discharge bloody discharge is the more common symptom.

In Cases 5, 6, 7, and 8 the presenting sign was titis of the nipple.

CASE 5.—W. U., a 47-yr.-old white housewife, was the department of radiology in December, 1946, "eczema of the right nipple." In addition to the skin the patient had noted a serosanguineous discharge nipple for the preceding eight weeks. No masses could in either breast. Dr. E. P. Pendergrass made a clinical of Paget's disease of the nipple and this was biopsy. On Dec. 24 a radical mastectomy was Dr. H. A. Zintel. No tumor mass was noted on gross examination of the breast. Directly beneath the nipple were greatly dilated, and a thick, greenish exudate expressed from them. Microscopic examination erately extensive intraductal carcinoma without

---

[7] Fitts, W. T., Jr.; Maxwell, J., and Horn, R. C., Jr.: The Significance of Nipple Discharge, unpublished data.

a. None of the 13 lymph nodes that were removed from xilla contained carcinoma.

se 6.—L. S., a 53-yr.-old housewife, was seen in the sur- outpatient department in February, 1949, because of an matoid" reaction about the right nipple. Eight weeks pre- ly she had noted a bloody discharge, which was soon fol- by redness and scaling of the nipple. Examination of the t revealed no abnormalities except the scaling eczematoid ss eroding the nipple. No secretion could be expressed from ipple. A biopsy of the nipple revealed the malignant changes get's disease. A radical mastectomy was performed on h 2. On microscopic examination an extensive intraductal oma was demonstrated, with associated Paget's disease e nipple, but no invasion was noted except in the nipple Carcinoma was not detected in any of the 16 axillary h nodes removed at operation.

se 7.—M. T., a 51-yr.-old white housewife, was admitted e hospital on April 29, 1949, because of a small scaling on the right nipple, which she had first noticed almost r before. The lesion was on the upper margin of the nipple was about 1.0 cm. in diameter. No masses were palpated o discharge could be expressed from the nipple. On April e nipple was excised by Dr. F. L. Payne. Microscopic ex- ation disclosed Paget's cells in the epithelium of the nip- nd in the epithelium of an adjacent duct. The diagnosis get's disease of the nipple was made and a radical mast- y performed on May 3. No breast tumor was noted on examination. Malignant changes were observed in two e ducts adjacent to the nipple. None of the removed axil- lymph nodes contained carcinoma. A recent follow-up ex- ation revealed no evidence of recurrence or metastasis.

se 8.—G. C., a 44-yr.-old white housewife, was admitted e hospital on Oct. 30, 1949, because of itching and red- of the left nipple. Eight months before admission she had ed peeling and itching of the skin of the left nipple. This followed by a serous discharge and crusting of the nipple. e four months preceding her admission to the hospital, her le became inverted and reddened. On examination, no es could be felt in either breast. A biopsy of the nipple, rmed after admission to the surgical outpatient depart- , was interpreted as showing Paget's disease. After the nt was admitted to the hospital, some observers noted an ular mass immediately below and medial to the nipple which not fixed to the skin. Radical mastectomy was performed ct. 31 by Dr. Michael Newton. The mass proved to be and irregular, and microscopically it was made up of ds of anaplastic tumor cells freely invading the surround- reast tissue. Twenty-seven of the 40 axillary nodes removed ained carcinoma cells.

omment.—It is our belief that Paget's disease of the le results from the extension of intraductal carci- a distally into the nipple and that it should be ted by radical mastectomy. When the pathology of et's disease is considered, it is not surprising that reast mass often cannot be palpated. Case 8 is espe- ly interesting because over half of the axillary lymph les removed at radical mastectomy were involved by cinoma in spite of the fact that no breast mass could felt. This case illustrates the necessity of doing a ical mastectomy rather than a mere resection of the ple or a simple mastectomy for Paget's disease of nipple.

n Cases 9, 10, 11, and 12 the presenting sign was me- asis to the axillary lymph nodes.

ASE 9.—I. W., a 35-yr.-old white housewife, entered the pital on April 20, 1947, because of a lump in the left axilla ed two weeks before admission. For about one year pre- asly, aching had occurred intermittently in the left axilla and iated to the left breast. Examination revealed no masses in the breast, but a mass was felt in the left axilla that was approximately 2.5 cm. in diameter, firm but freely movable. On April 21 Dr. F. L. Payne excised this mass, which proved to be a friable, hemorrhagic lymph node. Microscopic examination disclosed a mucoid type of carcinoma within the node. The morphology of the carcinoma was considered consistent with an origin in the breast, although not necessarily diagnostic. Studies to determine the origin of the tumor included roentgen examinations of the chest and the entire gastrointestinal tract, but these uncovered no abnormalities. Examination of the breasts by several observers disclosed no masses. On April 26 a left radical mastectomy was performed. In the left lower quadrant of the breast, buried deeply in the stroma, was an uncircumscribed, hard, 1.0-cm. mass, which on histological examination proved to be a characteristic mucoid carcinoma. It is striking that the only axillary lymph node involved with cancer was the one removed for biopsy, the 27 removed at radical mastectomy being free of malignant cells. A recent follow-up examination disclosed no evidence of recurrence or metastasis.

CASE 10.—G. S., a 46-yr.-old housewife, entered the hospital on Aug. 18, 1948, because of a "lump in the left armpit," noted two months previously. The axillary mass was firm but freely movable. Several examiners were unable to locate a definite mass within the breast, although the upper outer quadrant was diffusely thickened. The day after admission the axillary node was excised by Dr. J. E. Rhoads and a biopsy taken of the suspected area of the breast. The area of breast removed measured 2 by 1 by 0.4 cm. Gross and microscopic studies revealed dilated ducts filled with coagulum and surrounding round-cell infiltration. No malignant cells were discovered. The pathologist made a diagnosis of chronic cystic mastitis.

The axillary node measured 4 by 3 by 1.0 cm. and on microscopic examination was noted to be filled with cords of anaplastic tumor cells, occasionally forming tubules.

The following studies, made because a primary lesion could not be identified in the breast, did not disclose significant abnormality: roentgen examination of the gastrointestinal tract and chest; intravenous urogram; cholecystogram; and proctosigmoidoscopy. Believing that the most likely site of the primary lesion was the breast, Dr. Rhoads removed the left breast and axillary contents on Aug. 26. Gross examination disclosed a firm, fixed nodule, 1.5 cm. in diameter, deep in the breast parenchyma on the lateral side of the nipple. It lay well below and medial to the previous breast biopsy site. On microscopic study this mass proved to be the primary tumor. None of nine axillary lymph nodes removed at radical mastectomy contained tumor cells.

The patient reentered the hospital on Jan. 3, 1949, because, at the follow-up examination, dimpling of the skin of the right breast was discovered just lateral to the areola. No definite breast mass was evident. Excision biopsy of the area, performed the day after admission, revealed carcinoma, and a radical mastectomy was performed. No axillary metastases were discovered on microscopic examination. This carcinoma differed cytologically from the carcinoma of the left breast in that it appeared better differentiated. The fact that the tumor of the right breast was small and had not metastasized to the axillary nodes would suggest that the tumor of the right breast was an independent primary carcinoma. Follow-up examination in September, 1950, revealed no evidence of recurrence.

CASE 11.—T. W., a 63-yr.-old Negro housewife, entered the hospital on Aug. 29, 1950, because of a lump in the left axilla first noticed a month and a half previously. The patient knew of no abnormalities of the left breast, and no masses could be felt by any of several observers. Roentgen examinations of the chest and skeleton were negative. The lymph node was removed by Dr. John Thomas on Aug. 30, and examination by quick-frozen section revealed carcinoma. Because of the probability that the lymph node was invaded by metastatic carcinoma from the left breast, a left radical mastectomy was immediately performed. Careful sectioning of the breast revealed a tumor 1.0 cm. in diameter just beneath and to the right of the areola. Microscopic examination confirmed the diagnosis of carcinoma.

It is interesting that, among the 20 axillary lymph nodes removed and examined microscopically, carcinoma was found only in the one that brought the patient to the hospital.

The above three cases support the conclusion of Jackson[3] and Cogswell[4] that, in the female, metastatic carcinoma of the axillary lymph nodes in which the primary site cannot be discovered by physical examination and laboratory studies probably arises from a hidden mammary carcinoma and that radical mastectomy is justified. Under these circumstances, however, carcinoma of the breast is not always disclosed by radical mastectomy, as is illustrated by the following case.

CASE 12.—A. R., a 52-yr.-old white practical nurse, entered the hospital on Nov. 19, 1948, because of a mass in the right axilla, which she had noted five weeks previously. Over the fourth rib in the axilla lay a 5.0 cm. by 3.0 cm. round, discrete mass that was freely movable. None of the several examiners could find any breast masses.

The axillary mass was removed on Nov. 20 and microscopic examination disclosed a lymph node almost completely replaced by cellular tumor tissue thought to represent undifferentiated carcinoma. The following studies were performed in an attempt to identify the primary lesion: roentgen examination of the gastrointestinal tract with barium sulfate; intravenous urogram; roentgen examinations of the chest and skeletal system, and cholecystogram. No significant abnormalities were revealed. After these studies had failed to disclose a primary lesion, a right radical mastectomy was performed on the strength of a tentative diagnosis of carcinoma of the breast. A thorough examination of the breast failed to reveal carcinoma, and examination of the axillary nodes excised at this operation was also negative. A letter from her physician in December, 1949, stated that the primary tumor had not become apparent, and our last communication from the patient, on May 31, 1950, stated that her general condition had not changed.

In Case 13 the presenting sign was edema of the skin.

CASE 13.—J. H., a 63-yr.-old white business woman, entered the hospital on Sept. 11, 1949, because of edema of the skin f the right breast. A left radical mastectomy had been perrmed by Dr. I. S. Ravdin two years previously for a carinoma 8.0 cm. in diameter in the upper, inner quadrant of the left breast. No axillary metastases had been discovered. The patient had been examined at regular intervals of three months and no abnormalities were noted until June, 1949, three months before admission, when it was discovered that the entire right breast seemed denser and heavier than normal. She was then examined at more frequent intervals; the thickening increased and, just before her readmission, edema of the upper outer quadrant appeared. None of several observers was able to feel a mass in the breast.

Dr. Ravdin performed a simple mastectomy on Sept. 12. Gross examination of the removed breast revealed a 2.5 cm. hard nodule deep within the breast tissue caudad to the nipple. The nodule was not attached to skin or to fascia, but was infiltrating the surrounding breast tissue. Microscopic examination confirmed the diagnosis of carcinoma. We regard this as a metastasis from the cancer of the left breast. It is interesting that many of the lymphatics contained small tumor emboli. Probably the blockage of lymphatics by cancer first caused the increased density and thickening of the breast, leading later to edema of the skin.

Comment.—Edema of the skin is usually a late sign of carcinoma of the breast and is usually associated with a palpable mass. Carcinoma that has a tendency to invade lymphatics early may produce lymphatic obstruction of such extent that edema appears before the tumor can be palpated.

In Case 14 the presenting sign was retraction of the skin.

CASE 14.—I. B., a 50-yr.-old white housewife, enter hospital on Dec. 12, 1949, because of an area of skin retr in the right breast that had been discovered four weeks at a routine examination in the cancer detection clinic o hospital. The suspicious area was just medial to the areo was not associated with a palpable mass. The retracti not marked, and the patient was seen in consultation b I. S. Ravdin, *who could not feel a mass but* considered th retraction was suggestive of carcinoma; he performed a cision biopsy of the area on Dec. 13. The quick-frozen se diagnosis was chronic cystic mastitis, but examination o paraffin sections revealed an intraductal carcinoma with t cells invading the surrounding stroma. Accordingly, a ra mastectomy was performed on Dec. 30. The pathologist de strated *numerous intraductal* papillomas showing atypical ch but no evidence of carcinoma in either the breast tissue rem at radical mastectomy or in the 41 axillary lymph n sectioned.

Comment.—Most intraductal carcinomas first m fest themselves by a palpable mass, nipple discharg Paget's disease of the nipple. This lesion, located to the nipple and immediately beneath the skin, duced retraction of the overlying skin as its initial cal manifestation.

In Cases 15 and 16 the presenting sign was di *metastasis.*

CASE 15.—*Orbital Metastasis.*—R. D., a 56-yr.-old housewife, entered the hospital on the ophthalmological s of Dr. Francis Adler because of diplopia. Physical exami revealed a small, hard mass in the right supraclavicula but no evidence of a primary lesion in the breast. Th breast was noted to be larger than the left but the patient that she had observed this for many years. Ophthalmo *examination revealed a mass above and temporal* to th eye that was pushing the eye downward and inward. Dr Zintel excised the supraclavicular mass on Oct. 16, 1947 and microscopic examination disclosed a lymph node replaced by undifferentiated malignant cells. Although the tumor was thought to be a reticulum cell sarcoma, on study the diagnosis of carcinoma was made. The pati presented in tumor conference; *none of the several* ex could feel a definite mass in either breast, but some out a suggestive area of skin retraction in the upper oute rant of the right breast. Excision biopsy of this area, f by simple mastectomy, was performed by Dr. Zintel, wh that no definitely outlined mass could be demonstrated a tion. The biopsy specimen measured 4 by 4 by 4.0 c *tissue was essentially fibrous and fatty, but in the white* tive tissue representing breast stroma, a moderate nur tiny brownish cysts were noted. A considerable portion tissue had an extremely hard texture. Microscopically m epithelial cells were noted, interspersed in a great ove of fibrous connective tissue. The lesion was diagnosed cinoma of the breast.

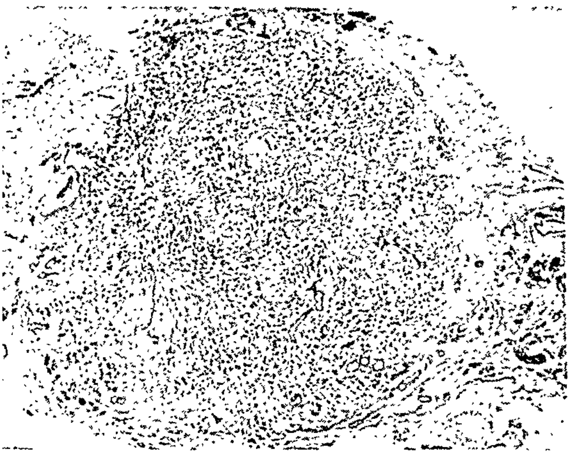
CASE 16.—*Abdominal Metastasis.*—E. J., a 50-yr.-ol housewife, entered the hospital on June 15, 1947, on the of Dr. P. O. Klingensmith. Examination before admissi shown fixed bilateral adnexal masses *thought to* be ca of the ovaries. Sixteen years previously a left radical mast had been performed in another hospital for carcinon axillary metastases were demonstrated pathologically. admission to the Hospital of the University of Pennsylv masses could be felt in the right breast or in either axilla. tion was performed on June 17 by Dr. Klingensmith a H. A. Zintel. The peritoneal cavity *contained* bloody flui the small intestine and its mesentery were matted wit white plaques grossly resembling carcinoma. Both ovari enlarged, forming masses about 7.0 cm. in diameter whi hard and nodular. Palpation revealed involvement of t terior wall of the *stomach* and the transverse colon. Th operative diagnosis was carcinoma of the stomach with tases to the ovaries. Biopsies *were taken* from the me of the transverse colon, the right ovarian mass and th n, and the procedure terminated. *Microscopic examina*-:vealed infiltration by cords or masses of fairly small and m cells separated from one another by dense, acellular of hyaline stroma. Pleomorphism was not striking and itotic figures were seen. The morphology was consistent arcinoid as well as with carcinoma: special stains did not ;e argentaffin granules. The tumor was considered meta-although the primary site remained undiscovered.

lowing discharge from the hospital the patient was given ive *roentgen-ray therapy* and did remarkably well until er, 1949, when she developed partial intestinal obstruc-nd was readmitted to the hospital. Exploratory operation erformed on Dec. 19, 1949, in the hope of relieving the ction but the tumor growth was so extensive that the site struction could not be determined. She died on Dec. 25. time during her illness was a mass felt in the right breast : repeated physical examinations. At post-mortem exami-, however, Dr. H. T. Enterline discovered a 1.0 cm. nodule upper outer quadrant of the breast. Microscopic exami-of this mass, as well as of right axillary and mediastinal nodes, revealed a carcinoma morphologically identical he tumor in the ovaries and peritoneum. Although the neum was the site of extensive carcinomatosis, abdominal ement was limited to the peritoneum, mesentery, and s. There were no pulmonary metastases.

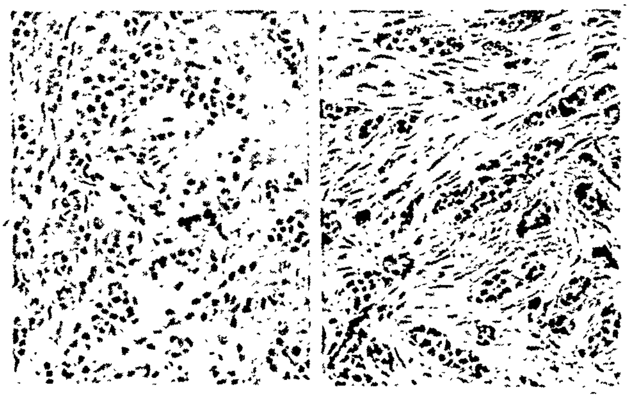
the light of the morphologic identity of the abdominal ight mammary lesions, the involvement of right axillary nodes and a morphologic picture quite consistent with nary carcinoma (*Figs.* 2 and 3), *we believe this case to* sent an instance of latent breast carcinoma with wide-d metastasis. The possibility must be considered that all : neoplastic lesions present at autopsy were secondary to ncer of the left breast, although the 18-yr. interval between adical mastectomy and death makes it seem more likely he carcinoma in the right breast was a new primary tumor.

COMMENT

f these 16 patients with occult mammary carcinoma, fall into two well-recognized groups, the presence aget's disease of the nipple leading to the diagnosis ie group and the symptom of nipple discharge in other. We believe this is noteworthy because Paget's se of the nipple is not regarded as a manifestation ntraductal mammary carcinoma by all observers, there are those who interpret nipple discharge as ite evidence of a benign lesion. Although three of e eight patients had axillary lymph-node metastases, breast carcinomas associated with these two pre-ing signs may still be in an early stage of their lution. That skin retraction may also be an early sign of mammary carcinoma is illustrated by Case 13. In three cases the breast carcinoma first became manifest clinically by axillary lymph-node metastases, in itself a sign of advancement of the disease. It is of interest that in each of these three cases the lymph node initially removed proved to be the only one in which metastatic carcinoma was found. In the remaining three cases the diagnosis of breast carcinoma could not be established until signs of hopelessly advanced disease were present, skin edema in one instance and distant metastasis in two.



. 2 (Case 15).—Cross-section of the whole mammary carcinoma, was not detected during life despite widespread abdominal metas-Hematoxylin and eosin; × 11.



A *B*

Fig. 3.—Photomicrographs of *A*, the mammary tumor, and *B*, a peritoneal metastasis. Hematoxylin and eosin; × 231.

Four of these reported cases had bilateral mammary cancer. In two instances (Cases 13 and 16) the occult carcinoma may well have been a metastasis from a previously treated carcinoma of the opposite breast. Two other patients (Cases 1 and 10) with occult carcinoma of the breast subsequently developed cancer in the remaining breast and in one of these (Case 10) the second cancer manifested itself initially by skin retraction in the absence of a palpable mass.

SUMMARY

The first sign of carcinoma of the breast is not always a palpable mass. Physicians should be on the alert for discharge from the nipple, erosion of the nipple, retraction or edema of the skin over the breast and enlargement of axillary nodes, any one of which signs may indicate mammary carcinoma even in the absence of a palpable mass in the breast. We have reported 15 patients with occult carcinoma of the breast in whom operation was performed before a breast mass could be palpated, the diagnosis having been suspected because of one or more of these signs. A 16th case is included in which the breast was identified as the source of widespread abdominal metastasis only at autopsy.

Causes of Death in Children.—The so-called degenerative conditions—cardiovascular disease and cancer—now cause more deaths among children of school age in the United States than all the infectious and parasitic diseases combined. The array of infectious diseases frequently referred to as "childhood diseases" has in the past been associated with the young age group in various ways. . . . The infectious diseases are no longer more frequent than other diseases as a cause of death among school-age children.—Harold A. Kahn, M.D., Changing Causes of Death in Childhood, *Public Health Reports*, Sept. 28, 1951.

GASTROINTESTINAL HEMORRHAGE DUE TO NEUROFIBROMATOSIS

William P. Kleitsch, M.D., Omaha, John H. Kehne, M.D.
and
Charley F. Gutch, M.D., Lincoln, Neb.

Gastrointestinal hemorrhage, both acute and chronic, may result from involvement of the bowel in a generalized process of neurofibromatosis, also known as von Recklinghausen's disease. In a classical case of this disease a diagnosis is not difficult to make. In such cases, intestinal hemorrhage of obscure origin should be easy to evaluate. Often, however, neurofibromatosis occurs as a subclinical disease and the diagnosis may be readily overlooked. The patient may have no more than a few pigmented areas and/or a few subcutaneous nodules. However, it must be remembered that neurofibromatosis is always a generalized disease and bowel involvement is not uncommon. Therefore, when gastrointestinal bleeding of obscure origin is encountered, an effort should be made to rule out the possibility of neurofibromatosis; and conversely, when intestinal hemorrhage or chronic anemia occurs in a case of neurofibromatosis, gastrointestinal involvement should be suspected.

We are reporting two cases of severe gastrointestinal hemorrhage produced by gastrointestinal neurofibromatosis to illustrate the difficulties frequently attending the diagnosis. In both instances the diagnosis of bleeding peptic ulcer was abandoned with reluctance by the clinicians, despite the fact that no objective evidence of peptic ulcer was ever obtained.

REPORT OF CASES

CASE 1.—H. M. E., a 43-year-old white male gas station attendant, was admitted to the hospital on Feb. 15, 1950, for treatment of recurrent amebiasis. His chief complaint on admission was the presence of tarry stools for two days, associated with pain in the epigastrium, relieved by food and aggravated by bending, stooping, or lifting. As long as he could remember, he was troubled with epigastric distress when scooping grain or pitching hay. It was noted that his skin was covered with pigmented patches, which the patient stated had been with him as long as he could remember and had never given any trouble. He also stated that his mother and one of his brothers had similar pigmented patches, as well as a few small skin tumors. Physical examination was not remarkable with the exception of the skin. The following comment was made by the examiner:

> The complexion is dark because of numerous pigmented areas resembling freckles. These are particularly numerous in the various skin creases. In addition, there are a number of brownish, pigmented areas, some several centimeters in diameter, which have the appearance of *café au lait* patches. There is a small subcutaneous tumor about 1.5 cm. in diameter in the center of the forehead. This is fluctuant and nontender. A few smaller (0.5 cm. diameter) masses are noted over the abdomen and extremities.

The patient's past history is extremely interesting and worthy of some study. He was first seen in January, 1948, at which time he complained of tarry stools for about five days, with epigastric distress, nausea and vomiting, and generalized weakness. At that time he had been treated by his personal physician for two years as a peptic ulcer patient. Apparently his chief symptom was intestinal bleeding. He maintained himself on a stri regimen and was asymptomatic until Dec. 25, 1947. F tributed his bleeding at that time to an overindulgence i Christmas spirit. The blood cell count at that admissio 3,500,000 red cells and the hemoglobin value was 47% anemia responded to medical treatment. The gastroi series was negative and showed no evidence of ulceration. N theless, a diagnosis of duodenal ulcer with hemorrhag made. He was discharged in February, 1948, returning t hospital in July, 1948 (five months later), again for int bleeding. No evidence of anemia was present at this tim gastrointestinal series was repeated and a motor mea studied. A small esophageal hiatus hernia was discove this examination, but the progress of the motor meal was and no evidence of peptic ulceration could be disovered ever, in studying his stools, cysts of Endamoeba hystolyti

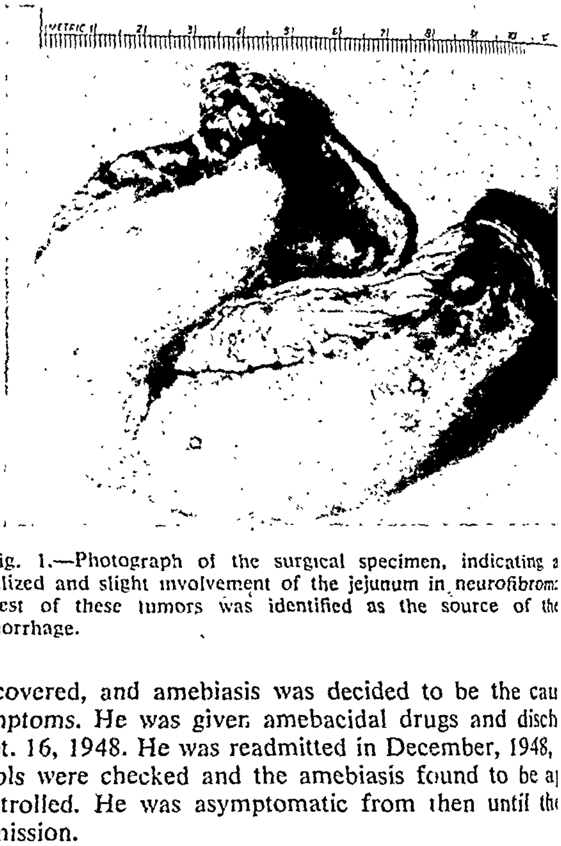

Fig. 1.—Photograph of the surgical specimen, indicating a localized and slight involvement of the jejunum in neurofibrom largest of these tumors was identified as the source of the hemorrhage.

discovered, and amebiasis was decided to be the cau symptoms. He was given amebacidal drugs and disch Sept. 16, 1948. He was readmitted in December, 1948, stools were checked and the amebiasis found to be a controlled. He was asymptomatic from then until th admission.

At this admission a mild anemia was present, 3,60 blood cells and 12 gm. of hemoglobin being found. Th intestinal series was again repeated and again found to b with the exception of a small hiatus hernia. A bariu was likewise normal. Surgical consultation was reque because of the chronic anemia and the history of a pain on exertion, it was felt that laparotomy and repa hiatus hernia was indicated. He was accordingly pre surgery, and on March 20, 1950, the abdomen was op explored. Numerous tumors were discovered, varyin from a pinhead to the size of a man's thumb, invo jejunum from the ligament of Treitz to approximately portion. A careful examination of the hiatus hernia re to be small and incomplete and covered by the left lo liver. It did not seem likely that this hernia was sym and it was felt that treatment of the tumors would alle symptoms. A routine appendectomy was done and 2 tumor-bearing bowel was removed, immediately dist ligament of Treitz (Fig. 1 and 2). The continuity of t was restored by end-to-end anastomosis, and two small sized tumors were removed from the serosa without pe

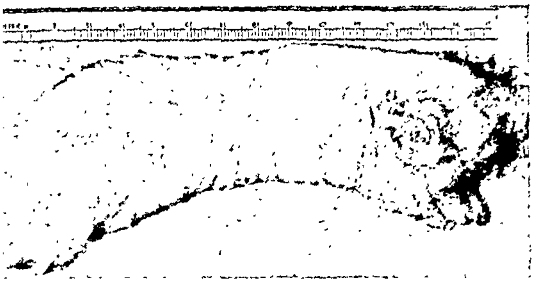
ıcosa. One additional navy-bean-sized tumor was removed the mid-jejunum by segmental resection and end-to-end mosis. The patient made an uneventful recovery from ıeration. The pathologist's diagnosis was: (1) neurofibroma, le, of small intestine; one neoplastic growth undergoing ıatous changes (Fig. 3), (2) lymphadenitis, chronic, (3) nor- ›pendix. Before discharging the patient the nodule on his ad was excised for biopsy. This confirmed the diagnosis of lized neurofibromatosis (von Recklinghausen's disease).

mment.—This patient was observed by various ɪs over a period of four years without a diagnosis ı Recklinghausen's disease being made. Even when iagnosis was made, its significance was not appre- l. Making a diagnosis of peptic ulcer in the face of eatedly negative gastrointestinal series cannot be ›ned. Confusing the symptoms of intestinal neuro- natosis with intestinal amebiasis and hiatus hernia derstandable. These latter conditions were elimi- by a therapeutic test for the former and laparotomy e latter.

E 2.—W. F. N., a 62-year-old white male farm laborer, dmitted to the hospital on May 5, 1950, for observation tate of chronic anemia. He was in no particular distress s blood count was normal. His past history revealed that s first seen in August, 1945, at which time he entered the al for treatment of a duodenal ulcer with secondary anemia.



2.—The surgical specimen opened to demonstrate the mucosa. It noted that the largest of the tumors is the only one protruding e bowel lumen. Furthermore, the mucosa over it is largely intact. ıglike nature of the protuberance gives a false appearance of an rater. The ring is in reality merely the edge of the tumor and is l by intact mucosa. The area of ulceration is represented by the lark area in the center of the ring.

:al examination at that admission noted the generalized fibromatosis and the examiner made the following observa-

ꜱ entire surface of the body is studded with nodules, ıg in shape and size from that of a pea to a walnut. There ıre numerous areas of pigmentation of irregular sizes and s scattered over the body, the color being similar to that :ckles.

·ay examination of the gastrointestinal tract was negative. :sophagus, duodenum, and colon were all reported as nor- Despite the negative gastrointestinal series, the patient was arged with diagnoses of: (1) duodenal ulcer with hemor- ·, (2) generalized neurofibromatosis (von Recklinghausen's se), (3) anemia, secondary to diagnosis 1 [*sic!*].

was next admitted to the hospital in February, 1946 (six hs later), for treatment of a recurrent duodenal ulcer with ia. He stated that since his previous discharge he felt well ıt for periods of weakness, and his hospitalization was at uggestion of his private doctor who discovered anemia to esent. The x-ray examination was repeated and the gastro- inal tract was again found to be free of any demonstrable, ısic lesions. A repeated gastrointestinal x-ray confirmed the hat no disease was present in the duodenum. Biopsy of one ıe skin nodules confirmed the previous diagnosis of von linghausen's disease. He was given peptic ulcer treatment ıte of the negative x-rays and a free gastric acid of only :rees and was discharged with the diagnoses of (1) recurrent duodenal ulcer (!), (2) von Recklinghausen's disease, and (3) anemia, secondary to diagnosis 1 (!).

He was readmitted on Feb. 8, 1950 (one year later), for the treatment of a duodenal ulcer with hemorrhage. Moderately severe hypochromic anemia was discovered to be present. The red blood cell count was 3,500,000 with only 6 gm. of hemoglobin. The gastrointestinal work-up was repeated with negative results as previously found. He was treated for the anemia and was discharged with the diagnoses of: (1) multiple neurofibromatosis involving the skin, (2) secondary anemia, cause undetermined; but a note was made that it was the opinion of the examiners that the bleeding was due to neurofibromatosis and

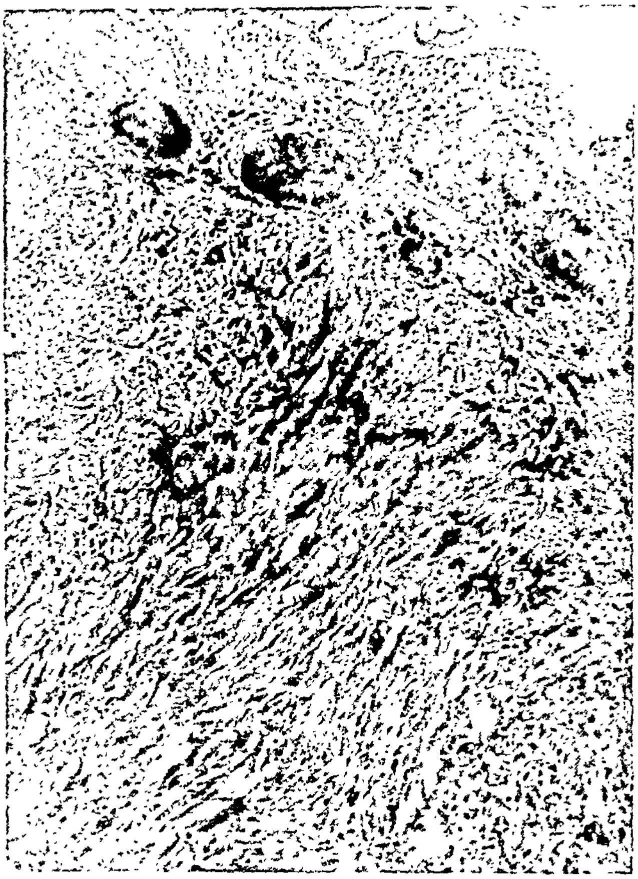


Fig. 3.—Microphotograph of a histological section taken through the base of the ulcer.

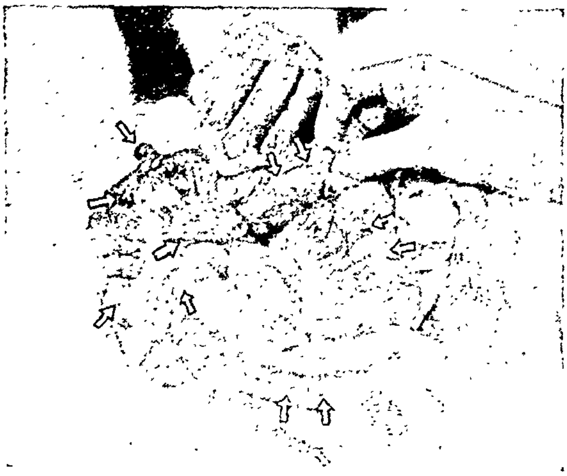

Fig. 4.—Photograph taken at the operating table. Because of lack of critical focus, the diffuse involvement of the bowel is difficult to show. The larger tumors are easily identified by the arrows.

volving the gastrointestinal tract, which could not be demonstrated by x-ray. It was recommended that he return to the hospital after a period of six weeks for further observation.

At the present admission his blood cell count was normal although the red cells were described as being microcytic. Biopsies were taken of several tumors of the skin which were described as being angioma, lipoma, and neurofibroma. These findings were felt to be compatible with a diagnosis of von Recklinghausen's disease. He was prepared for surgery, and on May 31 a laparotomy was done. Numerous tumor nodules were found extending throughout the length of the small bowel. There were none found in the colon. The largest of the tumors was about 5 cm. in diameter and on a rather slender pedicle (Fig. 4). Two of the largest tumors were removed by means of a partial resection of the bowel and a transverse closure of the defect. It was impossible to consider removing all of the tumors because of their vast number and, since the two largest had been excised, it was felt that further attempts at removing the tumors were unwarranted. A routine appendectomy was, therefore, done and the abdomen was closed in layers. The patient made an uneventful recovery. The pathologist's report was (1) fibromyoma of the small bowel, and (2) neurofibroma of the appendix.

Comment.—This case indicates that something was learned by our experience with the previous one. At any rate, a diagnosis of intestinal neurofibromatosis was made and the patient was operated on for the treatment of that condition. Here again it is remarkable how reluctant his physicians had been to abandon the diagnosis of bleeding peptic ulcer despite a total lack of objective evidence to indicate an ulcer.

COMMENT

Ewing [1] states that neurofibromatosis "consists of a congenital and often hereditary disturbance in the growth and differentiation of the fetal neuroectoderm, and a maladjustment with the mesoblastic tissues which it innervates." The multiple tumors, therefore, may involve any mesenchymal tissue, and as a result the manifestation of the disease may be protean. When there is concomitant skin involvement, the diagnosis is usually obvious and is seldom missed by the astute clinician. When skin involvement is minimal, the manifestations of the disease may be very puzzling. Indeed, many of the specific manifestations of neurofibromatosis have, in the past, been classified as separate disease entities, such as osteitis fibrosa cystica, tuberous sclerosis, hairy nevus, and elephantiasis.

When the gastrointestinal tract is involved, the symptoms produced are very vague. The tumor arises somewhere in the mesenchymal tissues and gradually grows in size until the overlying mucosa becomes ulcerated. Ulceration of the mucosa is always owing to the presence of a growing tumor under it and not to direct involvement. This is characteristic of all mesenchymal gastrointestinal tumors. Since ulceration and subsequent hemorrhage is a function of the mucosal pressure produced by the tumor, it becomes obvious that bleeding will occur at different times in the various tumors. A small, submucosal nodule growing into the bowel lumen will produce ulceration much sooner than a larger, subserous nodule growing outward into the peritoneal cavity. Bowel obstruction is seldom produced, and pain is minimal. A tumor large enough to be palpable will usually force a surgical exploration, even if the diagnosis of neurofibromatosis is missed. The condition, however, should be suspected long before the tumor becomes palpable. The diagnosis depends on the demo of two facts: (1) microcytic anemia due to chr testinal hemorrhage of obscure origin (or acute in hemorrhage of obscure origin), and (2) evid neurofibromatosis.

Surgical intervention is indicated once the di is suspected. The intestinal bleeding can only b trolled by resecting the involved portion of bowel though elimination of the disease is not an att goal, control of chronic hemorrhage is sufficient tion for operation. Sarcomatous change in the tu neurofibromatosis has long been recognized as a d possibility and is an added incentive for surgical e tion. The probable incidence of malignant degen of each tumor would be a difficult thing to evalua likely, however, that rapidly growing nodules or a den change in size of an old nodule indicate malignant change has already occurred. Furtherm seems logical, and is compatible with the behav other types of malignancy, that when malignant eration occurs it will be multicentric rather than ized. It is to be expected, then, that operation removal of the tumors of von Recklinghausen's will result in the discovery of occasional malig and will occasionally be followed by malignant de tion of a remaining nodule.

The technique of resection of intestinal neurof should include an appreciation of the activity o tumors. Since they seldom metastasize to lymph a block dissection such as is used for carcinom indicated unless lymphatic involvement is demon Local excision at a sufficient distance from the usually adequate. Segmental resection of the indicated if the nodules are so closely scattered dividual excision is impractical. Associated pre such as preparing the bowel with antibiotics and ing the anemia before operation should not be ne

CONCLUSIONS

Generalized neurofibromatosis (von Reckling disease) may involve the gastrointestinal trac intestinal neurofibromatosis has few symptoms positive clinical findings. Intestinal neurofibr must be suspected when a patient with ge neurofibromatosis shows signs of acute or chr testinal hemorrhage.

4101 Woolworth Ave. (Dr. Kleitsch).

The Diabetic in Industry.—Diabetics are now followin occupations and holding positions in a wide variety industries. There are few occupations, indeed, fro diabetics who take insulin need be excluded. These few in which the worker has more or less constantly in the safety of others as well as himself. Such few occ are those of locomotive engineer, airplane pilot, bus worker on high buildings or with potentially dange chinery. Although in such positions the chance of haza worker or his associates from a severe insulin reacti cipient acidosis is relatively small, the possibility ex there is an abundance of other work for the diabetic Harry Blotner, M.D., and Alexander Marble, M.D., Control: Detection, Public Education and Community *New England Journal of Medicine,* Oct. 11, 1951.

CLINICAL NOTES

ECTION OF PRIMARY TUMOR OF COLON EE YEARS AFTER EXCISION OF TASTATIC TUMOR

dgeway Trimble, M.D.

ght C. McGoon, M.D., Baltimore

vestigators[1] have found that the incidence of multi-
rimary *malignant tumors in* all cases *of malignant*
rs is about 3%. Of these tumors, roughly half
r simultaneously and half after varying intervals of
.[1a] *It has been computed*[2] *that an individual with*
nalignant tumor is more likely to have, subsequently,
primary malignant tumors than can be accounted
n the basis of chance alone. These multiple lesions
or may not occur in the same organ.

he incidence of multiple primary carcinomas of the
n has been estimated to be from 3.5% to 5%,[3] these
rring either simultaneously or at different times.
orts of such cases have been rather numerous[4] and
e to stress the point that palpation of the entire colon
ld be performed at the time of laparotomy for car-
ma. In two reported cases[5] each patient had four
nct primary carcinomas of the colon removed at
rent times.

he radical removal of metastases to lymph nodes is,
ourse, common, but surgical attack upon metastases
istant organs is still *infrequent. Three organs prin-*
lly lend themselves to the successful surgical eradica-
of metastases: the liver, the lung, and rarely the
n.

nce the first reported case of excision of metastases
e liver in 1888,[6] several similar cases and groups of
s have appeared in the literature.[7] Some of these
rations resulted in apparent cure of the disease. The
known case report of successful excision of pulmon-
metastases was made in 1944[8]; twelve years previ-
ly the patient had undergone lobectomy for a solitary
astasis. A report on the cases from the literature and
n various clinics, in 1947,[7e] listed a total of 24 cases
ulmonary resection for a solitary metastasis. Half of
patients were free of recurrence at the time of the
ort. Another group of several cases was reported a
months later,[9] one of which is of particular interest.
patient had had surgical removal of an adeno-
inoma of the sigmoid in 1944, underwent right upper
monary lobectomy 22 months later for metastatic
nocarcinoma and had a metastatic lesion of the brain
oved some six months after the lobectomy. The pa-
t was well at the time of the report, two months later.

he incidence of metastatic lesions of the brain in all
ns of intracranial lesions has been variously reported
being from 4.2% to 27.2%,[10] the probably correct
re being between 10% and 15%. In a series of 150
tine autopsies in which metastatic brain lesions were
nd,[10c] the brain proved to be the only metastatic focus
ver one-fourth of the cases. Although this fact might seem to encourage attempts at ablation of metastases to the brain, actually successful results following such attempts are extremely rare.

Dandy has stated that[10c] "a cure has probably never *resulted from removing an intracranial metastasis. Occa*sionally patients have been entirely relieved of symptoms for two or three years when a metastasis could be removed with a zone of normal brain." Oddly enough, it must have been at about the time he wrote these words that he performed the craniotomy on the patient whose case is to be reported. As stated above, the most unusual feature in this case is that the primary tumor was not to be removed until two and one-half years later.

REPORT OF CASE

S. L., a white man, was admitted to the Johns Hopkins Hospital on the neurological service in December, 1943, at the age of 54. He complained chiefly of severe frontal headaches for five months, with occasional radiation to the occipital region. There had been progressive difficulty in walking, a shuffling gait, poor muscular coordination and concentration, and occasional morning vomiting. These were all subject to wide daily variation. On examination he was seen to be well developed, somewhat thin, and with poor memory and poor powers of concentration. No *abnormal conditions were found* except on neurological examination, which showed left homonymous hemianopsia with slight bilateral papilledema, most noticeable on the right. There was loss of position sense in the left foot and of stereognosis in the left hand. The patient was extremely unsteady on his feet and the Romberg test was positive. No definite motor disturbances were present. A diagnosis of tumor in the right parieto-occipital

region was made. Dr. Dandy performed a craniotomy on Dec. 13 and excised the entire mass intact; this was about as large as one's fist (7 × 6 × 4.5 cm.), very hard, and weighed 86 gm. The bone flap was replaced. On pathological examination the specimen was noted grossly to be fairly well circumscribed except at one portion where it invaded the cortical tissue. On microscopic examination it was shown to consist of large, irregular, undifferentiated cells with areas of necrosis here and there. he cells were definitely not those of a brain tumor but rather of an epithelial carcinoma of some sort. The microscopic appearance suggested that of a lung tumor (Fig. 1).

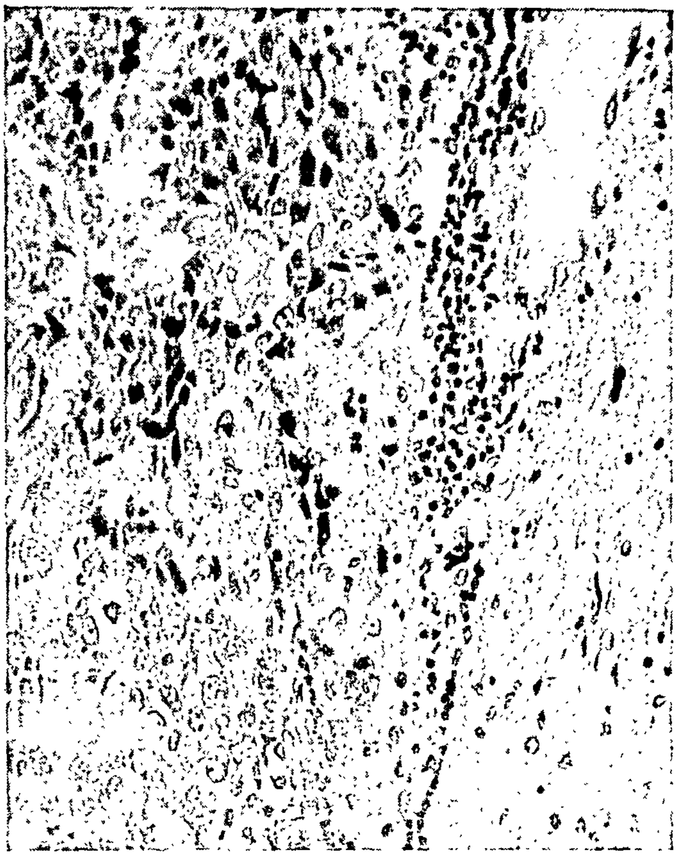

Fig. 1.—A section through the border of the metastatic lesion removed from the right occipital region of the brain in 1943. This shows undifferentiated carcinoma in the brain (× 215).

The postoperative course was uncomplicated, with rapid disappearance of the preoperative complaints. An x-ray film of the chest showed no pulmonary lesion, but further study was not carried out.

For some 25 months the patient was well and conducted his business affairs regularly, but at the end of this time he began to suffer with burning epigastric pain associated with intermittent diarrhea; there was occasional streaking of the stools with bright blood and the loss of 12 to 15 lb. (5.4 to 6.8 kg.) in weight.

Five months after the onset of these symptoms the patient was again admitted to the hospital and was referred to us by Dr. F. J. Otenasek, who had assisted Dr. Dandy at the craniotomy. On this examination there was found to be residual, complete, left homonymous hemianopsia, evidence of moderate loss of weight, a hemoglobin reading of 9.8 gm., and a freely movable mass deep in the right lower quadrant. A gastrointestinal series was negative, but a barium sulfate enema showed a definite deformity of the cecum due to neoplasm.

On Aug. 12, 1946, exploratory laparotomy was perfo
one of us (I. R. T.). The cecum was found to be the se
dense scirrhous tumor aproximately 7 cm. in diameter,
entirely within the wall of the cecum. The ascending colo
this appeared normal, but a similar mass was felt in the
verse colon. This second mass seemed to be attached by a
narrow pedicle to the mesenteric border of the colon. T
of the colon was normal until one reached the lower

ılyps in the lower sigmoid and upper rectum and the large ılyp with a broad base 12 cm. proximal to the anal orifice, was the one which had been felt at operation. No ulcera- 'as seen in these polyps. A barium enema revealed a num- additional polyps in the remainder of the transverse colon ı the upper portion of the descending colon. Resection of mainder of the colon was advised but was refused by the t.

ıin the patient lived normally for about two and a half after the resection of the colon. He returned to the hos- ıt that time, however, about five years and two months he craniotomy, because of a three-week history of inter- t partial intestinal obstruction associated with abdominal s and, paradoxically, diarrhea. He had lost about 15 lb. g.) in those three weeks. On examination the homonymous nopsia was seen to persist, and in addition the abdomen noderately distended, with audible, high-pitched active ılsis, but no masses were palpable. His hemoglobin reading 4 gm. On x-ray examination an obstructing mass was seen left half of the transverse colon, just proximal to the c flexure.

3.—A section through the obstructing mass at the splenic flexure, d in 1949, showing undifferentiated carcinoma invading the bowel × 215).

ı Feb. 23, 1949, one of us (I. R. T.) again performed laparot- and found a large growth in the transverse colon just mal to the splenic flexure. Accordingly the old ileocolostomy ıll the remaining portion of the transverse colon, together the entire descending colon down to just above the peri- ıl pelvic reflection, were resected. The terminal portion of igmoid was opened and a number of small benign-looking ɔs were excised. An open end-to-end anastomosis was per- ed between the terminal ileum and the stump of the rec- intraperitoneally. The operator felt that a complete abdomi- rineal resection of the rectum was unnecessary since rectal ps which might recur could be easily removed by cautery ı below. The postoperative course was again uneventful, and ɔatient was discharged on the 15th postoperative day.

ıis third surgical specimen showed an ulcerated, circular ır involving the entire bowel wall toward the proximal end ıe specimen, and a large multilobulated polyp in the distal with 30 or 40 small polyps throughout the remaining por- ı of the segment. Microscopically the two large tumors were n seen to be adenocarcinomas (Fig. 3); all the small polyps : apparently benign.

As of April, 1951, the patient was living and apparently well, and was carrying on his normal daily activities. It had been seven years and four months since the large metastastic adenocarcinoma was removed from the brain, four years and eight months since right colectomy was performed, with removal of two separate primary carcinomas of the colon, and two years and two months since left colectomy was performed, with removal of two additional separate carcinomas.The patient remained active and healthy, and no evidence of recurrence of the disease was found on physical examination, April 26, 1951.

SUMMARY

A case is reported in which excision of a metastatic carcinoma from the brain was followed, after an interval of several years, by removal of the primary carcinoma from the colon. Of additional interest in this case is the fact that there were four separate carcinomas of the colon, two removed two and one-half years after the brain operation and two more three years later.

8 W. Madison St.

SCROTAL CYSTOCELE

Bernard Levine, M.D., New York

Inguinal herniation of the urinary bladder is not uncommon. Its incidence has been estimated as varying from 1% to 3% of all inguinal hernias. However, inguinal bladder hernia descending into the scrotum is rare. The purpose of this report is to add two cases of scrotal cystocele to the literature and to review briefly the previously published cases.

Thirty cases of scrotal bladder hernia have been reported. In each of these cases a major portion of the bladder formed all or a part of a large inguinal hernia. The magnitude of the vesical hernia prompted several authors to make the diagnosis of a herniated diverticulum of the bladder.

REPORT OF CASES

Case 1.—S. M., a man aged 57, was first seen in March, 1947. At that time his complaints were two episodes of hematuria in January, and one attack of left ureteral colic in February. He had nocturia once per night. As the result of an x-ray taken by his physician after the colic, he was told that he had damaged kidneys and that he probably passed some gravel. In an excretory urogram taken by his physician there was noted a bilateral hydronephrosis with hydro-ureters. Function was delayed so that the urinary tract was best visualized at 90 minutes after the injection of the contrast media. The bladder was noted to be either pushed or drawn to the right side of the pelvis.

Physical Examination.—The kidneys were not palpable. There was no costovertebral tenderness. The genitalia were normal. The prostate was firm, smooth, and not enlarged. There was a moderate-sized right scrotal hernia which was known to have been present for seven years.

The residual urine was 10 cc. However, before removing the catheter, pressure was placed on the hernia. This resulted in the delivery of an additional 150 cc. of residual urine. A retrograde cystogram was then made. This revealed the pelvic portion of the bladder to be drawn toward the left side. The major part of the bladder was present in the inguinal and scrotal regions (Fig. 1).

A right inguinal incision was made. The bladder was found to make up the content of an extraperitoneal direct inguinal hernia. The inguinal and scrotal bladder was mobilized and replaced, unopened, into the abdomen, and a hernial repair was done. A urethral catheter was left indwelling for four days to

---

From the Genito-Urinary Service of [illegible] S. Lubash, Beth Israel Hospital keep the bladder at rest. The postoperative course was uneventful.

Follow-up.—A follow-up excretory urogram one month after operation revealed a normal bladder, normally situated. There was no longer any hydronephrosis on the left side and the dilatation of the right pelvis and ureter was considerably diminished. One year later another urographic study showed maximum excretion of the contrast media at 10 minutes after injection. The urogram was entirely negative except for some minimal residual dilatation of the lower right ureter.

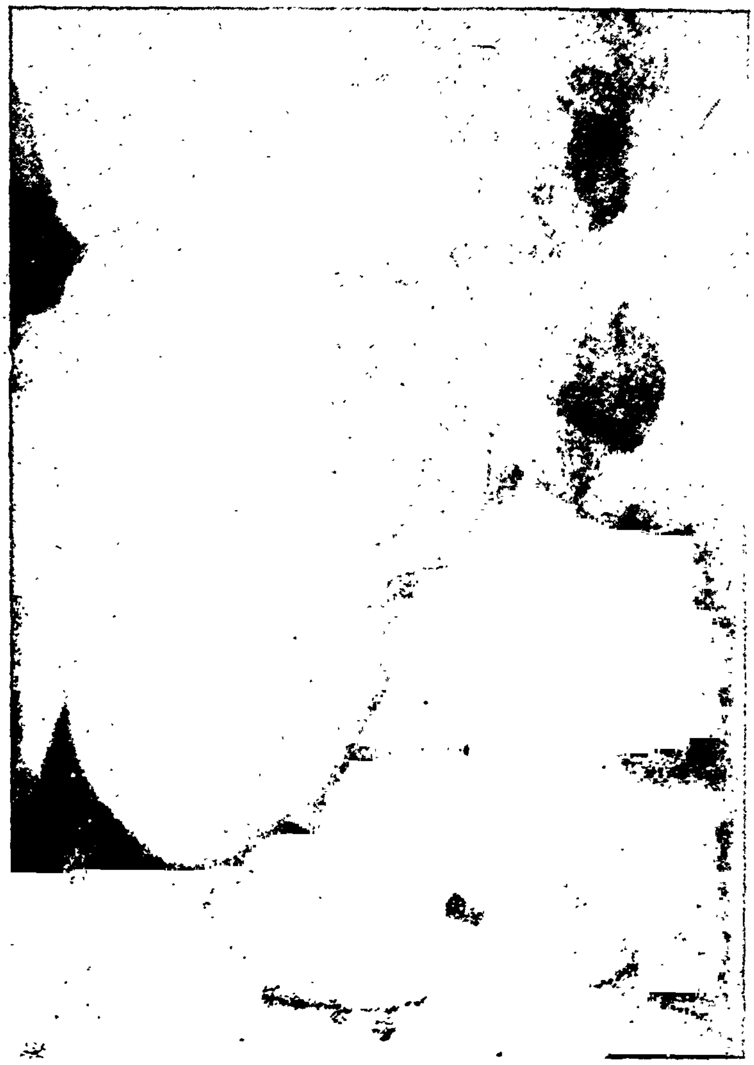

Fig. 1.—Case 1. Preoperative cystogram.

Case 2.[1]—C. R., a man aged 81, was admitted to the Beth Israel Hospital in April, 1948. His complaints at that time were hematuria of four days' duration, frequency, and dysuria. In December, 1946, he had a suprapubic cystolithotomy and prostatectomy.

Physical Examination.—Excretory urogram and cystoscopy revealed a 4-cm. calculus within the bladder. The upper urinary tract was normal. There was no bladder neck obstruction. A suprapubic cystolithotomy was performed. In looking for the cause of the calculus formation, a large right scrotal hernia of long standing was investigated by cystogram. This showed a right scrotal cystocele (Fig. 2). In view of the patient's age and generally poor condition, operation was deferred. However, he was instructed in the placing of local pressure on the hernia to empty the bladder completely whenever he voided.

Follow-up revealed that he had the hernia operated on by another physician, who resected the herniated bladder. The patient died postoperatively.

Bladder hernias have been described as intraperitoneal, paraperitoneal, and extraperitoneal, depending on their relation to the peritoneum. In the intraperitoneal type a complete peritoneal sac is present and th is contained within it. In the paraperitoneal ty herniated bladder process is found to be cover peritoneal sac on one side only, the other side bladder being uncovered. In the extraperitoneal ty herniated portion of the bladder is neither co with nor engaged in a peritoneal sac. The com forms are the paraperitoneal and the extraper hernias. Of the 32 cases reported (including the two), 10 were paraperitoneal, seven were ext toneal, and one was *intraperitoneal*. In the remain cases, either the type was not mentioned or op was *not* performed.

Inguinal bladder hernias have a predilection f right side. Heineck[2] in a review of the literature 88 right vesical hernias and 58 left vesical herni scrotal cystocele we have found the right side in in 20 cases and the left in nine. The side was not tion in three instances. Nine patients had been pre operated on for inguinal hernia.

The patient with a scrotal bladder hernia will have some urinary complaints. Frequency, noctur dysuria have been commonly noted. A significa is that of two-stage urination. The patient emp

e cystogram, first used by Sgalitzer [4] in 1921, pro- an excellent diagnostic measure. It was used to the diagnosis in 16 cases. The characteristic abality noted was a dumbbell-shaped bladder with a segment present in the scrotum and the remaining n of the bladder situated in the abdomen. The er was usually drawn somewhat toward the side of ıtion. If the patient is allowed to void the contrast ı and an x-ray is taken, a residual collection may ɜn trapped in the herniated bladder.

Case 1 there was an associated bilateral hydroneis. This was probably caused by an angulation in gion of the ureterovesical junction, which in turn he result of the bladder displacement. This condivas previously reported in two cases, both of which postmortem findings.[5] As far as I could determine, 1 was the first case of bilateral hydronephrosis due otal cystocele in which the diagnosis was made in ving patient. Repair of the hernia and replacement bladder resulted in a correction of the hydroneis.

e treatment of scrotal cystocele is surgical. How the types of operation have varied. Ten patients not operated on either because of the patient's poor ition or his refusal. Of these, five patients died.

six cases the herniated portion of the bladder was ɜd and repair performed. Five patients did well, ne died.

Gayet's [6] case a cystostomy had to be resorted to ise of acute urinary retention. This patient died peratively.

e scrotum was incised in two cases because of an in diagnosis. Guyon made a diagnosis of right nal and scrotal abscess and incised the scrotum, a urinary gush resulting. An indwelling urethral ter was inserted, and the urinary fistula closed in 50 Plater incised the scrotum thinking that it cond a tumor, and a urinary flow with much sand re1. A urinary fistula formed which closed eventually. ie bladder was opened and then repaired without al resection in three cases. Two of these were ed by error. In the third case Rougier [7] performed guinal cystolithotomy prior to hernioplasty. All had satisfactory end-results.

ie most favored procedure, which was done in 11, was replacement of the unopened bladder followed ernioplasty. All except one were successful. In this the patient suddenly died on the third postoperative

SUMMARY AND CONCLUSIONS

vo cases of scrotal cystocele (scrotal bladder ia) are presented. This condition may cause bilateral onephrosis, and Case 1 is to my knowledge the first in which the diagnosis was made in the living patient.

The literature is briefly discussed.

The preferred treatment of scrotal cystocele is replacement of the unopened bladder and hernioplasty.

GASTROINTESTINAL ALLERGY SIMULATING REGIONAL ENTERITIS

REPORT OF A CASE

George I. Blumstein, M.D.
and
Julian Johnson, M.D., Philadelphia

The patient with repeated attacks of gastrointestinal allergy usually recognizes the relationship between his offending allergen and the onset of symptoms. Since symptoms and signs seldom warrant surgical intervention, the bowel probably is not often visualized during such attacks. In instances of negative abdominal exploration, in which it is suspected that gastrointestinal allergy may be the correct diagnosis, the gross appearance throughout the bowel is that of a mild edema, if any change at all is noted.

In an intestinal resection recently performed by us for presumed regional enteritis, the diagnosis on histological examination proved to be gastrointestinal allergy. The occurrence of striking localized changes in the gross appearence of the bowel, as the result of an allergic response, is probably rare, and the possibility of such an occurrence is surely not widely recognized.

REPORT OF CASE

A. E., male, aged 26, was admitted to the University hospital on July 6, 1949, because of midabdominal cramping pain of eight hours' duration, associated with nausea but with no vomiting. He had had one loose bowel movement that morning. His family physician had advised hospitalization because of right lower quadrant tenderness and mild rigidity. His white blood cell count was 13,400 with 70% polymorphonuclear leucocytes and 2% eosinophils. The urine was normal.

The patient had experienced three previous similar attacks of abdominal distress accompanied by right lower quadrant tenderness. The first had been on March 13, 1949, and had lasted 24 hours. The second, on April 27, 1949, was the most severe and had lasted 48 hours. The temperature had been normal and the white blood cell count 10,000, with 66% polymorphonuclear leucocytes and 5% eosinophils. The third attack had been on June 5, 1949, and had lasted one day. The family physician had considered the possibility of gastrointestinal allergy.

The patient was known to have had asthma since the age of five years. The asthma was usually not very troublesome and was precipitated primarily by respiratory infections. There were no known food, drug or inhalant allergies, but the family history was strongly positive for allergic response on the paternal side.

Assistant Professor of Medicine, Temple University School of Medicine (Dr. Blumstein) and Professor of Surgery, University of Pennsylvania School of Medicine (Dr. Johnson).

Physical Examination.—At the time of the patient's admission to the hospital physical examination revealed mild tenderness and muscle guarding over the right lower quadrant. There was no rebound tenderness. There was marked tenderness on the right side on rectal examination. Sibilant and sonorous rales were heard throughout the lungs.

Preoperative Course.—The dull pain persisted in the right lower quadrant, and on several occasions there were sharp, colicky pains of short duration. The patient had one small, liquid stool. The morning after his admission the tenderness and mild rigidity in the right lower quadrant were still present and rebound tenderness was now evident. The white blood cell count had risen to 16,000 with 67% polymorphonuclear leucocytes and 7% eosinophils. The temperature was still normal. It was thought that the three previous attacks and the present attack might well be due to acute appendicitis.

Operation.—Operation was performed under spinal anesthesia. About 500 cc. of clear fluid were found in the abdominal cavity. The appendix appeared to be normal. The terminal ileum was markedly thickened and edematous. About 35 cm. of the terminal ileum was involved. The appearance was thought to be typical of the subacute stage of terminal ileitis.

In view of the three previous attacks it was reasoned that there was persistent, or recurring, regional enteritis and that immediate resection was justifiable rather than a closure of the abdomen followed by further attacks. The disease was confined to the terminal ileum. The possibility of its being an allergic phenomenon was not considered. About 45 cm. of the terminal ileum was resected, along with the right part of the colon, and an ileotransverse colostomy performed.

The gross pathologic examination indicated that the resection had been carried about 10 cm. beyond the disease process. The diseased ileum was thick and edematous. The vessels of the serosal surface were congested and there was a white mottling under the serosal surface. The mesentery contained several enlarged nodes.

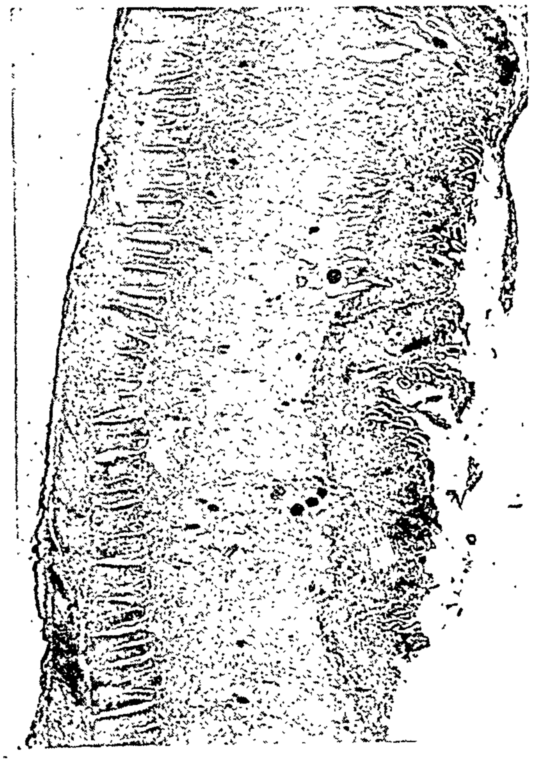

Fig. 1.—Section of the ileum showing marked edema of the submucosa and subserosa with infiltration by myriads of eosinophilic leucocytes.

The surgical pathologist's report on the histologic sections was as follows: "Sections of the termnial ileum show a marked edema of the submucosa and subserosa [Fig. 1]. The entire wall is infiltrated by myriads of eosinophilic leucocytes [Fig. 2]. The process apparently is an entirely allergic one, without any evidence of ulceration of the mucosa or of an ordinary pyogenic infection, and extends from the proximal to the distal of the resection. Edema in the areas designated above is more marked in the distal 30 cm. of the resected ileum. nodes in the mesentery show dilatation of the sinuso edema and eosinophilic leucocytic infiltration. These suggest very strongly that this is an allergic enteritis."

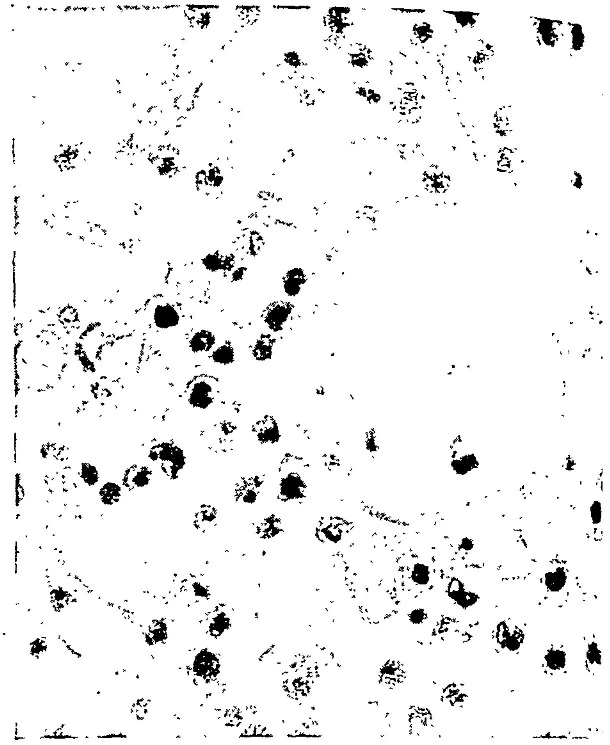

Fig. 2.—An area of the submucosa of the ileum showing massive philic infiltrate.

Postoperative Course.—The patient made an unevent covery and returned to work after a short convalescence. next four months he experienced three more attacks of abd distress, all following the ingestion of seafood. The fi after eating oysters and lasted two and one-half hours. T ond followed a lobster dinner, was quite severe and respond to therapeutic doses of ephedrine, epinephrine histaminics. The attack lasted 48 hours. The final atta lowed the ingestion of mock turtle soup and lasted 12 The patient has avoided seafood since that attack and h free of gastrointestinal symptoms.

COMMENT

The diagnosis of gastrointestinal allergy is arrived at by clinical means and is not considere unless the cause-and-effect relationship between fending allergen and the gastrointestinal sympt established. Peripheral eosinophilia, or the roen graphic demonstration of gastric retention, abnor testinal motility with segmentation of the small bow decreased luminal caliber should arouse the suspi allergic involvement of the gastrointestinal tract involvement occurs most often in patients with ot lergic manifestations.

The patient reported fulfils the necessary r ments. He had an allergic background. The relati between the ingestion of seafood and the attacks dominal pain appears to be established beyond ar sonable doubt. Lastly, the microscopic appeara the resected ileum showed the typical picture of ar gic response.

While the presence of varying numbers of eosin in the bowel wall is not abnormal,[1] they are not ap seen to the exclusion of all other types of cells ex hypersensitive states The ability of the ileum to a ıock organ" has been amply demonstrated by Gray, rten, and Walzer.[2]

---

[1] Ham, A. W.: Histology, Philadelphia, J. B. Lippincott Company, 1950, p. 440.

Although the ileum in this patient presented the gross ıearance of regional enteritis, it is unlikely that the rgic state is of importance in the etiology of regional ritis. Only a single reference was found in the literre[3] suggesting such a relationship. If such a correla- existed, regional enteritis could be expected to occur quently in allergic patients with other stigmas of a ersensitive state, patients in whom the cause-and- ct relationship could be demonstrated in a fair protion of cases. Furthermore, the histological picture in regional enteritis does not resemble that seen in er allergic states. It would seem, therefore, that the reported demonstrates the possibility of an error diagnosis between the two conditions on gross exination rather than any relationship between them n the standpoint of etiology.

SUMMARY

male, aged 26, who had had recurrent bouts of abninal distress was operated on during one such at- because of a presumptive diagnosis of recurrent te appendicitis. The terminal ileum was involved by ıt appeared to be reasonably typical regional enteritis. er resection, the histological picture of the ileum was nd to be typical of an allergic reaction.

The patient subsequently had three additional similar sodes of abdominal pain, each after the ingestion of food. He has remained asymptomatic on a seafood- diet since the third attack. This case therefore fulfils clinical, pathologic, and etiological requirements for diagnosis of gastrointestinal allergy.

IOLECYSTITIS IN CHILDHOOD

PORT OF A CASE WITH COMMON DUCT CALCULI

ex W. Ulin, M.D.

eph L. Nosal, M.D.

l

lliam L. Martin, M.D., Philadelphia

In 1949, we studied the literature on cholecystitis in ildhood.[1] This included a critical review of most cases scribed, as well as a survey by letter of 21 major clinics America and England. We found that many cases of patitis and peritonitis had been inaccurately reported cholecystitis. We judged that there were less than 400 thentic cases of cholecystitis since the first report in 22.[2] Although only 19 had common duct stone, we ırned that cholecystitis in childhood is often complited by jaundice, apparently obstructive. The signifince of this observation lies in the increased incidence hepatocellular types of jaundice. However, its clinical portance is tempered by the rare occurrence of cholestitis in young persons.

Our review included two fatal cases of cholecystitis with common duct obstruction, proved at autopsy. The patients' condition had been misdiagnosed as infectious hepatitis. We encountered the same diagnostic problem in a case of calculous cholecystitis and common duct stones in a 13-year-old girl.

REPORT OF CASE

M. G., a 13-year-old white girl, was admitted to the Sunbury (Pa.) Community Hospital on Aug. 16, 1948. She complained of pain in the right upper quadrant of the abdomen, of 24 hours' duration. She had been in excellent health prior to September, 1947, when she first noticed pain in the right upper quadrant. This pain was mild at first and periodic, occurring every two to three weeks, with no definite relation to food intake. During the first few months the pain did not radiate, but remained localized. Later it became more severe, was followed by nausea and sometimes vomiting, and radiated around the right subcostal margin to the inferior angle of the right scapula. In May, 1948, after a typical attack of abdominal pain, she noted jaundice of the skin and scleras, light clay-colored stools, and dark urine. The jaundice subsided after several days. In June the pain and jaundice recurred. She was observed at another hospital, where a diagnosis of infectious hepatitis was made. In July and August, 1948, attacks of pain in the right upper abdominal quadrant recurred, this time without jaundice. She was admitted to the Sunbury Community Hospital during a typical attack of biliary colic; there was no chill or jaundice, and stools and urine were normal in color.

The past medical history, family history, and social history contained no significant information except the fact that the mother had biliary tract disease and had never undergone surgery. Physical examination revealed an acutely ill and dehydrated child. The temperature, pulse rate, and respiratory rate were normal. Tenderness and muscle guarding were noted in the right upper quadrant of the abdomen. There was no evidence of icterus. The laboratory findings, including liver profile and red cell fragility studies, were negative. A cholecystogram revealed nonopaque calculi in the gallbladder; a phrygian cap was present. On Aug. 19, 1948, cholecystectomy and choledochostomy were done. The gallbladder was not acutely inflamed; the wall was blue-gray and slightly thickened. Within the lumen several small stones could be palpated. The hepatoduodenal ligament was acutely inflamed. The common duct was dilated and contained two small mulberry or bilirubin pigment stones. A T-tube was inserted into the common duct. The pathologic diagnosis was chronic cholecystitis with cholelithiasis. The T-tube was removed on the 13th postoperative day, and the patient was then discharged from the hospital. Follow-up visits for two years showed her to be in excellent health.

COMMENT

This case, with its proved pathologic findings, is a fair example of cholecystitis in childhood. It should be noted, however, that common duct stone is an unusual complication, occurring in only 6% of all cases reported. The patient gave a history of jaundice. As in many other cases, the condition was at first diagnosed as infectious hepatitis; the correct diagnosis was made preoperatively. Her symptoms began just after her menarche, when she was 12 years old. Twenty to 30% of the patients in the reported cases were in the 12 to 15 year age group.

In reviewing the literature we found that many cases reported as cholecystitis were not proved. We were able to accept 296 of the cases before 1937 as proved primary cholecystitis in childhood. In the available literature of the following decade we found 30 more cases. Of the

of the prone subject, who is placed with the face turned to one side and resting on the back of one hand. The other hand is extended above his head. The operator then places his hands over the floating ribs, with the fingers together and directed laterally. He exerts steady pressure downward and toward the subject's head for approximately two seconds, followed by a release and pause for three seconds. This pressure moves the viscera against the diaphragm and compresses the lower part of the back, resulting in active expiration. Inspiration is passive with release of pressure. The cycling rate is maintained at 12 to 15 times per minute.

Arm Lift-Chest Pressure (Silvester).—Proposed almost a century ago, this method [7] has more successfully weathered the adversities of time and testing than any other manual technique. The victim is placed in the supine position with the arms folded on the chest. The operator kneels at the head of the victim. He grasps the arms just above the wrists and draws them first upward and then above the head until they touch the ground. Stretching of the pectoral muscles and humerothoracic attachments produces active inspiration with this maneuver. The operator then replaces the arms on the chest and exerts pressure almost vertically downward to produce active expiration. Each complete cycle is carried out 12 times per minute. Great care must be exercised to prevent the tongue from occluding the oropharynx and preventing ventilation.

Arm Lift-Back Pressure (Nielsen).—The Danish Nielsen method [8] has been used successfully during the past 20 years in the Scandinavian countries. The victim is placed in the prone position with the arms folded and the hands placed on top of each other. The face is then placed on the hands. The operator kneels on either knee at the victim's head and places his hands under the arms just above the elbows. He lifts them upward at the same time that he rocks backward, drawing the arms toward himself until he meets firm resistance. They are then replaced on the floor, and the operator moves his hands to the midback (just below the scapulas) and rocks forward, exerting pressure almost vertically downward to cause active expiration (Fig. 6). The expiratory phase may be used to start the method, if desired. The complete maneuver is repeated 12 times per minute. When the arms are drawn upward, active inspiration results from several mechanisms: (*a*) The weight of the body is from the chest so that the thorax can expand. (*b*) pectoral musculature is stretched, tending to increase intercostal spaces and enlarge the thorax. (*c*) Wh shoulders are raised, the spine is placed in slight h extension, which further tends to increase inter spaces. With the exertion of pressure on the mid active expiration results.

Hip Lift.—This method [9] of producing active ins tion by rhythmical lifting of the hips was repropose promoted by Emerson in 1948, although it had previously investigated by Thompson.[10] The victi placed in the prone position as for the Schafer met The operator kneels on one knee at the level of the straddling the victim and placing the other foot the opposite hip. He places his hands under the hips the anterior superior iliac spines) and raises the p vertically upward 4 to 6 inches. The hips are then placed on the ground, and the cycle is repeated. In t tests the hip lift was performed at 12 times per min Lifting of the hips produces active inspiration a result of several mechanisms: (*a*) When the hips

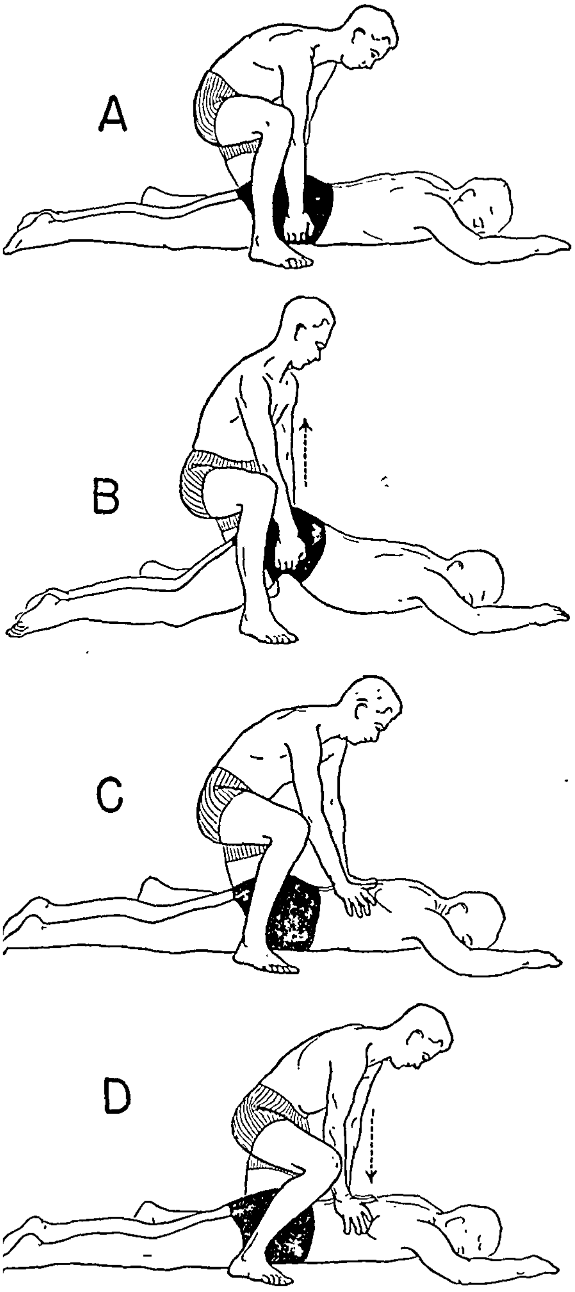
ated, the abdominal contents sag downward toward floor; this results in an intra-abdominal negativity tends to draw the diaphragm downward. (*b*) Be- e of the ligamentous attachments between the viscera diaphragm, the downward movement of the abdomi- organs is followed by a similar action of the dia- gm. (*c*) Elevating the hips hyperextends the spine d increases the intercostal spaces of the lower ribs. hittenberger, Affeldt, and Mead [11] have noted the reased intra-abdominal and intra-thoracic negativity placing recording balloons in the stomach and esopha- s. Gordon and associates confirmed these movements the diaphragm fluoroscopically.[1]



ig. 4.—Hip lift-back pressure method of manual artificial respiration. placing hands for hip lift, *B*, hip lift, *C*, placing hands for back pres- . *D*, back pressure.

Hip Lift-Back Pressure.—The hip lift-back pressure ethod [12] combines alternate lifting of the hips, as described above, with pressure on the midback (just below the scapulas) with the fingers spread and the thumbs about an inch from the spine (Fig. 6). As the operator lifts the hips he rocks backward, and as he exerts back pressure he rocks forward. In each phase he keeps the arms straight, so that the work of lifting and pressing is distributed over the shoulders and back, rather than being imposed primarily on the arms. Active inspiration results from lifting the hips and active expiration from pressure on the midback.

Hip Roll-Back Pressure.—This is a modification [12] of the hip lift-back pressure method in which a roll is substituted for the lift in order to increase the ease of performance. The operator kneels astride the prone subject as described for the hip lift method; instead of lifting both hips, he uses the knee on which he is kneeling as a fulcrum on which to roll the victim. The operator keeps his arms straight and rolls himself in the same direction in which he rolls the victim. Great care must be exercised to insure that the victim is rolled up onto the operator's knee or thigh so that both hips are raised from the ground.

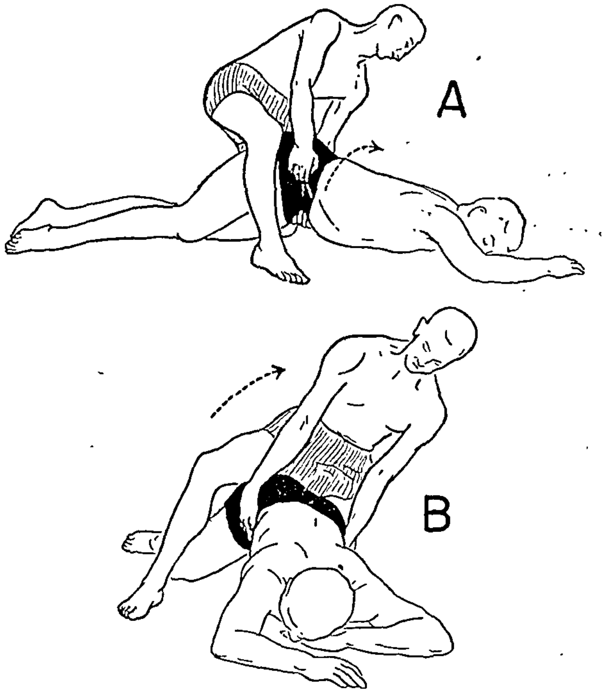


Fig. 5.—Hip roll-back pressure method of manual artificial respiration. *A*, side view of hip roll. *B*, front view of hip roll.

PULMONARY VENTILATION

The classical method of determining tidal ventilation is by the use of spirometric measurements. Although the distribution of ventilation in the lung and the effects of the methods on circulation are important considerations, the tidal volume still retains its value and is one of the simplest tests to make in comparative studies. In investigations of this nature, a number of methods must be applied to each subject since relative values between the methods are more important than absolute values.

[11] Whittenberger, J. L.; Affeldt, J., and Mead, J.: Dynamic Pulmonary Pressure Volume Relationship During Manual Artificial Respiration, to be published.

[12] Gordon, Fainer, and Ivy.[3] Gordon, Raymon, Sadove, and Ivy.[4]

Schafer prone pressure method in both sexes. Hip lift-back pressure was not performed, but, if calculated arbitrarily by adding the hip lift and the Schafer methods, it would have exceeded all others. The differences among the other four methods were not statistically significant, although the hip roll-back pressure method gave the greatest mean ventilation in both series. It was noted that pulmonary ventilation increased with an increase in the subject's body weight.

CIRCULATORY PHENOMENA AND GAS EXCHANGE

Whittenberger and Affeldt[18] have shown in dogs that with reduction in lung volume below normal there is relatively poor distribution of ventilation of the lung, resulting in a high degree of shunt of blood through underventilated areas. This would necessarily lead to faulty gas exchange and reduced arterial oxygen saturation. Distribution of ventilation is not improved by distending the lung above the normal range. It appears then that the most desirable range in which to ventilate a paralyzed chest is in the direction of increasing lung volume rather than diminishing lung volume—the latter being the case in the Schafer method.

TABLE 2.—*Mean Arterial Oxygen Saturation During Fifteen Minutes of Uninterrupted Manual Artificial Respiration on Fifteen Normal Healthy Adult Males Rendered Totally Apneic with Barbiturate-Curare Mixtures**

Method †	Mean Arterial Oxygen Saturation, %
Prone pressure (Schafer) ‡	67
Arm lift-back pressure (Nielsen)	93
Hip roll-back pressure	94
Hip lift-back pressure	89

* Arterial blood samples drawn during 7th and 15th minutes.

† Total of 15 cases used in which comparative data of several methods are available. Number of cases in which each method was used: Schafer, 9; arm lift-back pressure, 11; hip roll-back pressure, 4; and hip lift-back pressure, 9.

‡ In three out of nine cases in which the Schafer method was applied, it was so ineffectual that it was necessary to stop the method after several minutes in order to assure the patient's safety. In every case in which the Schafer method had to be discontinued, the push-pull method immediately preceding it and the one immediately following it were completely successful for the full 15-minute experimental period.

In addition, one may infer that those methods which produce active inspiration by increasing the intrathoracic negativity would have a beneficial effect on the circulatory system—especially a failing circulatory system—since they would probably promote cardiac refill. It might further be supposed that, since the pressure phase of the Schafer method occupies 40% of the total cycle (2 out of 5 seconds), it would tend to impede venous return as compared with the push-pull methods, in which the pressure phase occupies only 25% of the cycle.

Gordon[19] and associates[20] attempted to evaluate these considerations in studies on 15 normal healthy men curarized-anesthetized to total apnea. Three of the
four prone methods were applied for 15 minutes ea
all the subjects, always by the same operator. Expir
was collected in a Tissot spirometer from the 7th t
10th minute and from the 12th to the 15th minute.
ing these collection periods, arterial blood was d
from the femoral artery and mixed venous blood
a catheter previously inserted into the pulmonary a

The calculated cardiac outputs with all the m
covered a wide range, with the mean values ele
slightly above normal. The range and mean were ap
mately the same for all methods. This was appa
due to the fact that in these studies the cardiova
systems were normal and that the subjects wer
under the influence of heavy medication. Table 2 re
however, that the mean arterial oxygen saturatio
depressed from the normal in all methods. The ar
back pressure, hip lift-back pressure, and hip rol
pressure methods all maintained the arterial o
saturation at near normal levels, and there was no
cant difference among these methods. However, th
arterial oxygen saturation in nine cases in whi
Schafer method was applied was only 67%. In t
the nine cases in which Schafer back pressure wa
the method had to be stopped after several m
because of the profound cyanosis of the subjects.
of these subjects, from whom a blood specime
drawn before the method was discontinued, the
saturation was only 42%. An even more crucia
here is that, in every case in which Schafer back
was found to be inadequate and was stopped, th
pull method that immediately preceded it and t
that immediately followed it were able adequa
maintain the victim for the full 15-minute exp
period.

Pulmonary ventilation with the Schafer method
a normal level in these tests, averaging 6 and
per minute. Assuming that no alteration of the a
barrier existed during the application of the
method, and since the circulatory status of these p
had been shown not to be depressed, uneven a
ventilation appears to be the most probable caus
depressed arterial oxygen saturation. This is a
to the patient's breathing entirely within the
reserve volume with the Schafer method, and is i
plete agreement with Whittenberger's earlier w
dogs.

OPTIMAL TIMING OF THE CYCLES

ire approximately 1½ seconds for cessation of air . These active phases produce the end-inspiratory end-expiratory lung volumes and thus account for tidal volumes obtained. With release, air begins to in the opposite direction during the passive phases; since the next active phase is in the same direction his passive flow, it will accelerate the return of air. important consideration in timing, then, is that the t step, which is an active one, should be held long ugh for air flow to stop, but it does not matter in passive phases.

rom a purely practical point of view, the smooth ormance of the methods dictates approximately the e time requirement for completion of the release ıeuvers as for the hip lift, hip roll, arm lift, or back ssure manipulations. Accordingly, a 5 to 6 second le, executed 10 to 12 times per minute, with each of four phases occupying approximately 1½ seconds, ears physiologically and practically most ideal for the h-pull methods.

omroe[15] feels that these statements may be applic- to normal subjects with drug-induced apnea, but not necessarily apply to victims who actually require ficial respiration. A patient in need of artificial res- ıtion has usually been apneic for a few minutes, has h arterial carbon dioxide and low oxygen levels l is in need of hyperventilation, at least for a short e. Furthermore, if an error in ventilation is made, it ms advisable to him to err in the direction of hyper- tilation. Since the tidal volumes in his series of cases which there was actual pathology were much lower n the curarized normal subjects in the Illinois study, ıte even in excess of 10 to 12 times per minute would dly produce hyperventilation.

y the use of a rapid kymograph which allowed the ording of accurate measurements of the times re- red for each phase, he also noted that the last 3% 4% of the volume required an inordinately long time l that a more rapid cycling should eliminate periods low flow or no flow and so increase alveolar ventila- n. Accordingly, he believes that in actual apneic pa- nts a frequency of 15 or more per minute should be d.

ENERGY EXPENDITURE OF OPERATORS

The oxygen consumption per unit of time is probably most acceptable method for determining general ergy expenditure for a given task. It was used by rpovich and Hale at Springfield College.[17] In their ting, 10 males performed all the methods for three nutes on each of four conscious male subjects cover- a wide range of body weights. Ten female operators re studied while similarly performing on each of four nscious female victims. After each method the recov- y period varied from three to nine minutes, until the tabolic rate had returned to normal.

Their conclusions were the same for both male and male victims with few exceptions. During this three- nute performance period, Schafer prone pressure was und to require the least oxygen consumption; hip roll- ck pressure and hip lift (alone) required the most. ie Silvester and arm lift-back pressure methods occu- d an intermediary position, although less oxygen was nsumed in performance of the Silvester method.

Since conscious subjects may actively assist or resist manual resuscitative efforts, especially when these are extended over a prolonged period of time and become uncomfortable, the University of Illinois group[22] investigated fatigue while working on anesthetized subjects. In these tests, three subjects were anesthetized with ultrashort-acting barbiturates and kept asleep during the procedure by the use of a continuous intravenous infusion of the drugs. Curare was not used in this series, since measurements were not made on the subjects; only the expired air of the operators was collected. Each of nine operators (seven male and two female) of average size performed all the manual methods for an uninterrupted 10-minute period on one of the anesthetized subjects. The subjects were all of the same age, size, and weight, so that results among the various operators were comparable. Between each 10-minute performance period, and before beginning the next method, each operator rested 30 minutes. The methods were rotated in the order of their performance. Expired air was collected from the eighth through the tenth minute, so that the oxygen consumption during the last three minutes of the 10-minute performance period could be measured. A 10-minute period was arbitrarily selected, since this was considered to be a "reasonable" period for manual artificial respiration.

TABLE 3.—*Energy Expenditure of Operators as Measured by Oxygen Consumption During Uninterrupted Performance of Various Manual Methods of Artificial Respiration by Two Different Research Groups*

	Oxygen Consumption (Cc./Min.)		
	University of Illinois* Expired Air Collected During 8th to 10th Min.	Springfield College† Expired Air Collected During 1st 3 Min.	
Method	Mean of 7 Male and 2 Female Operators Working on 3 Anesthetized Subjects	Mean of 10 Male Operators Working on 4 Conscious Male Subjects	Mean of 10 Female Operators Working on 4 Conscious Female Subjects
Prone pressure (Schafer).....	873	547	445
Arm lift-chest pressure (Silvester)	1,162	706	480
Arm lift-back pressure (Nielsen)	1,165	948	657
Hip roll-back pressure........	1,377	1,047	746
Hip lift	.....	1,050	706
Hip lift-back pressure.........	1,625	.....	...

* Each operator performed all manual methods on one of the three anesthetized-subjects uninterruptedly for 10 minutes per method; 30 minutes rest period was observed between methods. All subjects were male, ages 21 to 30; height 68 to 70 in.; weight 148 to 158 lb. Male operators ranged in age from 20 to 34 years and in weight from 165 to 191 lb.; two females were 25 and 29 years and weighed 126 and 128 lb. Results from the individual operators paralleled group results. Oxygen consumption by two females was lower throughout, but relative values of the methods were the same as for the over-all group.

† Each method applied by 10 male operators on each of four conscious male victims and by 10 female operators on each of four conscious female victims. Methods applied for three minutes, allowing recovery period of from three to nine minutes, until the metabolism returned to normal. Male operators: ages 15 to 25; weight 110 to 230 lb.; female operators: ages 13 to 28 years; weight 105 to 168 lb.; male victims: 106 to 230 lb. and 65 to 73 in. tall; female victims: 90 to 165 lb. and 60 to 67 in. tall.

The data in Table 3 reveal that the energy cost of the methods fell roughly into three groups: Schafer was the least taxing, hip lift-back pressure required the greatest expenditure, and Silvester and arm lift-back pressure occupied an intermediary position. The hip roll-back pressure method occupied a position between the arm

22. Gordon, A. S.; Raymon, F.; Sadove, M. S.; Wedell, H., and Ivy, A. C.: Energy Expenditure of Operators During Manual Artificial Respiration, J. Appl. Physiol. 4:403-495 (Dec.) 1951.

lift-back pressure and the hip lift-back pressure methods. This trend was maintained by the individual operators, groups of operators, and the entire group. These results also correspond with the subjective feelings of fatigue of the operators. All the operators felt that the Schafer method was the easiest, and all except two considered the hip lift-back pressure most fatiguing. In all but these two, the arm lift-back pressure and the Silvester methods always occupied intermediary positions in their judgment of fatigue resulting from the 10-minute performances.

PEDAGOGICAL AND PERFORMANCE FACTORS

The practical application of new methods of resuscitation is dependent on factors other than those compiled in physiologic experiments. Assessments of the degree of difficulty in teaching, the accuracy of performance, and the discomforts experienced are essential. The groups at Illinois and at Springfield College investigated these factors.

The study by Karpovich[17] was carried out with 100 boys from Wilbraham Academy and 67 young men from Springfield College. The students were divided into small groups, and each group was given instruction separately in one session. During another session they were required to execute each method for 10 to 15 minutes. The order of performance of the methods was selected at random, with the exception of the hip lift, which was always given last.

The information furnished by these tests indicated that the methods considered easiest to learn were the arm lift-back pressure and arm lift-chest pressure methods. The hip lift was considered the most difficult. Exclusive of the Schafer method, these same two methods were considered least tiring and the hip lift most tiring. Most operators complained of discomfort in the knees in all methods and of discomfort in the back in the hip lift method.

With the cooperation of the National Opinion Research Center, who prepared and analyzed unbiased questionnaires, the University of Illinois[23] conducted tests on 1,000 naval recruits and 200 Waves at the Great Lakes Naval Training Center. Groups of naval personnel were given 10-minute lecture-demonstrations in the performance of the arm lift-back pressure, hip lift-back pressure, and hip roll-back pressure methods. After the lecture-demonstration of each method, selected at random in order to eliminate the factor of the learning of one method influencing the learning of a second method, recruits were called on to perform the method continuously for a 10-minute period. A random selection of operators and victims was utilized so that various sizes and weights would be paired. The victims were never used as operators, since their performance or judgment might have been influenced by having had the methods performed on them. Operators always performed the several methods on the same subjects. Trained monitors observed, corrected, and rated the operators on their performances; the operators rated the methods at the conclusion of each set of tests.

Observations and ratings of these performanc
vealed that the arm lift-back pressure, hip lift-back p
sure, and hip roll-back pressure methods can be succ
fully taught to naval recruits in relatively brief tra
sessions as used in these tests. Of these methods, th
lift-back pressure method surpassed all variations o
hip methods in accuracy of performance, ease of lea
—as measured by the need for an amount of correcti
and physical ease of performance. Among the hip m
ods, the hip lift-back pressure, especially when an adj
is used (such as a towel or belt under the hips to a
in lifting) in its performance, is most easily learned
accurately performed. It is, however, physically
difficult to do than the hip rolls. The hip roll-back
sure is not as accurately performed, especially in g
both hips clear of the ground, and with continued
formance is frequently done clumsily and with diffi
All operators were able to complete the 10-minute
formance period with each of the methods.

CONCLUSIONS

On the basis of all of the component parts of
studies, it may be said unequivocally that of the me
of artificial respiration investigated the Schafer
pressure method is the least effective for ventilatin
lungs. This in no way disputes the evidence tha
method has accounted for a large number of succ
resuscitations. It means, rather, that, on sound p
logic principles, there are manual methods availab
give greater ventilation and would most probably
resulted in an even greater number of successful re
The Schafer method is easy to teach and can b
formed for extended periods of time. Herein lie the
advantages that have promoted the method to its p
position of almost universal teaching in this count

Since it is apparent that prone pressure should
placed by one of the more efficient methods, the
immediate problem is selection of the push-pull m
that should be substituted for it. The various pus
methods have all proved their ability to resuscitat
sons actually requiring artificial respiration. Duri
past century, the Silvester method has had innum
successes attributed to it. The arm lift-back p
(used as the Holger Nielsen method) has been in p
for almost 20 years in the Scandinavian countri
has attained an excellent record there.

We know of six authenticated cases in which t
lift-back pressure method has been successfully ap
In each of these cases the Schafer method was orig
used and, when it appeared to be ineffectual, the h
back pressure method was tried. These cases were
lows: (*a*) the original case reported by Thomp
1932, in which the method was used to maintain a
myelitis victim for eight hours, until a mechanical re
tator became available; (*b*) three submersion case
ing the past year, all involving children—one in F
one in Chicago, and one in the Philippine Islands;
barbiturate intoxication patient in Boston who s
poor response with the Schafer method but wh
maintained with hip lift-back pressure; and (*d*) a
in Washington, D. C., who was successfully resusc
after being struck by lightning.

[23] Gordon, A. S.; Star, S.; Meier, F.; Hale, C., and Ivy, A. C.: Pedagogical and Performance Factors of Manual Artificial Respiration with Naval Personnel, J. Appl. Physiol. 4: 403-495 (Dec.) 1951.

Of the various candidate push-pull methods, the Sil- ter method retains its usefulness for particular in- nces but has one strong disadvantage which limits general applicability. When the victim is in the supine ition, the tongue frequently occludes the oropharynx d effectively limits or prevents ventilation. In the study warm corpses by Gordon and associates,[3] where the and tongue were allowed to fall freely into their nat- l position, in 50% of the cases in which the Silvester thods was applied there was no ventilation. By con- st, only 25% of the Schafer and hip lift subjects had ventilation and all of the arm lift-back pressure and lift-back pressure subjects were ventilated. When a ond rescuer is available and cognizant of this danger, airway can be kept clear by drawing out and securing tongue or elevating the jaw. This method is valuable cases in which the supine position is advisable (preg- ncy or burns or injuries to the anterior surface of the ly) or when a victim has been trapped in the supine ition.

The hip lift-back pressure method uniformly gives the atest ventilation in all the studies, and teaching which ures accurate performance is easy. However, it is icult, except for able-bodied men and women, to con- ue for long periods of time. In these tests young adults re able to complete 10-minute performance periods h the method. Children or small adults may find it possible to accomplish the hip-lifting technique. The roll-back pressure method requires less energy but is re complicated, and accurate performance requires ater indoctrination. With prolonged usage it is fre- ently performed clumsily.

The arm lift-back pressure method gives ventilatory umes that are double those of the Schafer method. has been shown to be easy to teach and is usually formed accurately after brief indoctrination periods. can be performed with relative ease by small adults d even children who are old enough to understand method and its application. The method can be ntinued for long periods of time without exhaustion, contrast to the various hip methods. In cases of injury the arm, or if a small operator becomes unduly fa- ued, back pressure alone may be used and gives greater ntilation than standard prone pressure over the floating s.

Although the arm lift-back pressure method is most plicable for general usage, medical personnel and other ined persons should be accomplished in the applica- n of other methods, including the hip lift-back pressure d arm lift-chest pressure methods. These provide ready ernatives when particular circumstances preclude the e of the arms or the legs, or when it is essential that the ctim be in either the prone or the supine position. When ssible, the hip lift-back pressure method should be ed, since its ventilatory efficiency, even in cases with thological processes, is of proved superiority.

A rate of 12 times per minute seems ideal for the appli- tion of the push-pull methods. Accurate determinations air-flow have shown that this timing most adequately ilizes the time allowed for each phase. Furthermore, sting of naval personnel indicated that the methods uld be continued at this rate for full 10-minute periods. It was easy for recruits to establish and maintain the rate of 12 times per minute. When errors in rate and rhythm were noted, they were in the direction of slowing the maneuvers (probably owing to fatigue) rather than accelerating them. The Shafer prone pressure method has also been taught at a rate of 12 per minute, and the use of this same rate will probably facilitate the teaching of new methods.

However, the observation of Comroe must be considered, namely, in his patients who had pathological processes actually requiring artificial respiration, lower tidal volumes were obtained than in normal subjects with drug-induced apnea. Because the victim requiring resuscitation has hypercapnia and hypoxia, any error in the amount of ventilation should be in the direction of hyperventilation. Accordingly, for this type of patient a rate of 15 times per minute may be more applicable.

The purpose of artificial respiration is to draw air into the lungs, rather than to force air out. It would seem most advantageous, therefore, to begin the push-pull methods with the active inspiratory phase. However, since resuscitation exigencies are often associated with obstruction of the airway, it may be more practical in the final analysis to begin artificial respiration with the pressure phase. The methods would then become: back pressure-hip lift, back pressure-hip roll, back pressure-arm lift, and chest pressure-arm lift. In actual practice the time lag between starting with active inspiration or active expiration is so small that it should not prove to be of significance.

RECOMMENDATIONS

1. As soon as is compatible with the pedagogical factors involved, the Schafer prone pressure method of manual artificial respiration should be replaced by one of the more efficient push-pull methods.
2. Of the push-pull methods, the arm lift-back pressure method (which, if begun with active expiration, may be more appropriately termed back pressure-arm lift), slightly modified from the original Holger Nielsen method, is preferable for general indoctrination.
3. Other push-pull methods that are acceptable, and are specifically applicable in special circumstances, include the hip lift-back pressure and the Silvester method (arm lift-chest pressure) methods.

Congenital Defects.—It has been emphasized by numerous workers that biological characteristics, including responses to experimental manipulation, are the result of an interaction between the genetic and the past environmental influences which make up the organism's constitution. Some characteristics are determined largely by genetic factors and others by environmental agents, while still others occupy an intermediate position. The fact that no one has been able to produce defects experimentally in 100% of the offspring of treated animals, even when using highly inbred material, shows that the production of such defects is influenced by environmental differences sufficiently subtle that they can occur within the maternal uterus. It is reasonable to suppose that this applies in human material as well. Clinically, therefore, the etiology of any given case of congenital defect (provided there is no obvious Mendelian pattern or environmental agent) must be attributed to a complicated interaction of genetic and environmental factors that can be defined *only in statistical terms.*—F. Clarke Fraser, M.D., and T. D. Fainstat, M.Sc., Causes of Congenital Defects, *A. M. A. American Journal of Diseases of Children*, November, 1951.

COUNCIL ON PHYSICAL MEDICINE AND REHABILITATION

The Council on Physical Medicine and Rehabilitation and The American National Red Cross have adopted the following statement. The Council and The American National Red Cross will welcome comments.

Ralph E. De Forest, M.D., *Secretary*,
Council on Physical Medicine and Rehabilitation.
Carl J. Potthoff, M.D.,
The American National Red Cross.

BACK PRESSURE-ARM LIFT METHOD FOR ADMINISTERING ARTIFICIAL RESPIRATION RECOMMENDED

The Council on Physical Medicine and Rehabilitation of the American Medical Association and The American National Red Cross and many other organizations, including the Armed Forces, the Federal Civil Defense Administration, the Public Health Service, the Bureau of Mines, the Boy Scouts and Girl Scouts of America, and the American Telephone and Telegraph Company, have endorsed the back pressure-arm lift method of artificial respiration for use by the general public when dealing with cases of asphyxia. The teaching and use of selected other methods may be indicated for special situations, but it is expected that the back pressure-arm lift method will supplant the prone pressure as the one most generally indicated. This endorsement follows a recommendation released December 3 by The American National Red Cross, National Research Council, Department of Defense, and Public Health Service.

TECHNIQUE OF THE BACK PRESSURE-ARM LIFT METHOD

The subject is placed prone, elbows bent, arms overhead with one hand upon the other. The cheek is placed on the hand, the face turned slightly to one side. The operator kneels on one knee the head of the subject and puts the foot of the opposite leg r the elbow. He places his hands on the subject's back, in h a way that the thumbs just touch, the heels of the hands eing just below a line running between the armpits. He rocks slowly forward, elbows straight, until his arms are approximately vertical, exerting steady pressure upon the chest. Then he commences to rock backward slowly and slides his hands to the subject's arms just above the elbows. He raises the arms until resistance and tension are felt at the subject's shoulders. Then he drops the arms. This completes a full cycle. The cycles are repeated 12 times per minute, the expansion and compression phases being of equal length, the release periods being of minimum duration. A standard technique for administering the method is being prepared by a committee representing many organizations.

EVIDENCE SUPPORTING THE ADOPTION OF THE BACK PRESSURE-ARM LIFT METHOD

During recent years a growing mass of evidence has indicated that several methods of approximately equal merit in meeting physiological needs are superior to the prone pressure method, and that among them the back pressure-arm lift method best meets the requirements for general public use.

A large share of the work definitely comparing methods has been recent. Studies of air exchange induced by artificial respiration have been made (1) on experimental animals, volunteers holding the breath, (3) on cadavers, (4) on sick jured persons who have stopped breathing, and (5) on who have been given barbiturates with curare, or other thetics, to stop breathing completely. Studies of other asp respiratory mechanics and physiology, blood and circulatio tissue changes have been made. Thus an extensive literatu been compiled since the prone pressure method was ad

It might be assumed that one method or another has a tage related to the circulation and thus indirectly upon t tissue, particularly nerve tissue such as the central nervou tem. Such evidence theoretically might occur because pres changes in the thorax aid the flow of blood or because the cedures mechanically stimulate the heart. The findings of vestigators, however, are that bringing oxygen quickly to alveoli is of overriding importance in maintaining and im ing cardiac action and circulation.

Accordingly, the relative effectiveness of different me appears to depend primarily upon the differences in the am of tidal air they induce. If the victim has been deprived o only briefly, a fairly small amount of air will revive him other factors such as cardiac fibrillation enter. But if his a no longer have oxygen, if his blood oxygen level is low, carbon dioxide level is simultaneously very high, if he the brink of heart failure and/or irrecoverable brain injur to oxygen lack, a large air exchange through artificial re tion is urgently needed. The deeper the asphyxia, the g the need for use of a method of artificial respiration gi large air exchange.

The evidence indicates that the prone pressure method least ventilation when needed most, that is, in the deeply as ated. Comroe[1] writes: "The Schafer method depends to extent on the elastic recoil of the lungs and tonicity in t piratory muscles; since these are absent in the deeply as ated patient, Schafer's method becomes of least value needed most." Further, Drinker[2] has pointed out that and atelectasis of the lungs develop, the degree becoming as time goes on. These conditions occur in the electroc carbon monoxide poisoned as well as in the drowned wh blood pressure falls. At such time, the more effectively tioning parts of the lung should be supplied with good levels and the ventilation should be good enough to keep carbon dioxide levels below undesirably high levels. The pressure method appears to have still another disadvantage ing recoil of the chest with this method, only a slight n pressure develops, particularly in the deeply asphyxiated. A ingly, when the respiratory passageways are partly obs by edema, mucus, vomitus, or drowning fluid, the air will be slower than if a greater negative intrathoracic p develops.

Swann[3] has shown that the failing myocardium (heart recovers quickly when provided with oxygen, if fibrilla not present. On the basis of his extensive studies he has "The desideratum of artificial respiration is a big tidal vol the biggest possible since this will bring more oxygen quickly to the myocardium."

Various studies have indicated that with volunteers their breath the air exchange when using the prone p method significantly exceeds the respiratory dead space space is represented by the passageways of the nose, p and larger respiratory tubes, and amounts in the adult to 150 cc. (about ⅓ pint). Obviously if the exchange is o that amount or less, the fresh air is not brought directl the deeper respiratory tract where it is needed. But eve volunteers holding the breath, the air exchange *is far* using the back pressure-arm lift method than the prone pr The prone pressure method is a one-phase maneuver part of the operator; he actively compresses the chest, b not actively expand it. Two-phase methods—including a where the operator actively expands the chest and one he compresses it—give much more ventilation.

The fresh cadaver perhaps resembles most closely the asphyxiated victim near death. Many workers such as

2. Drinker, C. K.: Pulmonary Edema and Inflammation, Cambridge, Mass., Harvard University Press, 1945.
3. Swann, H. G.: Studies in Resuscitation, Armed Forces Technical Report No. 6006 (Oct.) 1950.

Cordier[5] found that the prone pressure method gave ex- nges grossly less than the physiological dead space. Motley[6] ined figures of 78 cc., 50 cc., 140 cc., and 0 cc. in studies 4 cadavers, these volumes being attained only when the sub- s were in optimum positions; with slight variations in position, volumes were even less. Gordon[7] obtained far smaller air ange upon fresh cavaders, using the prone pressure method, he did using the pack pressure-arm lift, the hip lift-back sure, and other two-phase methods.

omroe and Dripps[1] obtained a ventilation of only 71 to 117 n two apneic clinical patients, using the prone pressure.

hittenberger[8] also found that the prone pressure method not give nearly as much ventilation on clinical patients at vard as did the back pressure-arm lift and the hip lift-back sure. Comroe's studies on 13 clinical apneic patients gave lar findings.

ordon and his associates[9] administered barbiturate-curare tures to 26 volunteers, rendering them completely apneic. n various methods of artificial respiration were administered. prone pressure method gave an air exchange average of cc., the back pressure-arm lift 1,056 cc., the hip lift-back sure 1,140, and the Silvester 1,069.

ordon and his associates also measured blood oxygen levels r administering artificial respiration for 15 minutes to these rized subjects. He found that the oxygen level in the blood markedly when the prone pressure method was administered 15 minutes, but that with two-phase methods, the back sure-arm lift method being one of those studied, the oxygen ls remained at about 90% saturation. In several cases when prone pressure was used, cyanosis became so alarming that method had to be discontinued. On substitution with a two- se method, there was recovery from the cyanosis. Comroe, pps, and Whittenberger had similar experiences with regard yanosis in clinically ill, apneic patients. Gordon also found cardiac output was lower when the prone pressure method used than with the two-phase methods studied. The studies mentioned are only a few of those done.

DIFFICULTY OF EXECUTING, AND PRACTICAL EDUCATION FEATURES

seems evident that anyone can satisfy himself concerning ease of doing the back pressure-arm lift method and of ning it. The method probably is not quite as easy to do and each as the prone pressure, but yet is an easy one. A child frail person can administer the method to a heavy person. as been taught and used in Europe, especially in Denmark Norway, for many years. In answer to specific inquiry, the l Cross Societies of those nations state that there have been injuries during administration of the method, either in teach- sessions or in actual resuscitation efforts.

owever, special studies were made in this country by Karpo- [10] and by Gordon[11] and his associates; in addition, informal lies have been made in Red Cross classes, utilizing in some s the services of professional educators and safety engineers. Y. M. C. A. has also included this method among those it hes.

hese studies, in general, show that the prone pressure is easy lo and to learn, and that the back pressure-arm lift is almost easy, can be continued long, and can be done by a child or t person upon a heavy subject. The hip lift-back pressure l the hip roll-back pressure are harder to do, cannot be done at by some upon heavy subjects, and induce fatigue quicker than back pressure-arm lift method.

he back pressure-arm lift method is essentially the Holger- lsen Method.

n the basis of the scientific evidence that the back pressure- lift method satisfies the physiological requirements essen- ly as well as any other studied and has advantages over the ne pressure method, and that it is a feasible one for use under d conditions of asphyxia and for a broad educational pro- m, its adoption for general public use is recommended.

COUNCIL ON FOODS AND NUTRITION

The following products have been accepted as conforming to the rules of the Council.

JAMES R. WILSON, M.D., *Secretary.*

Beech-Nut Packing Company, Canajoharie, N. Y.

BEECH-NUT STRAINED APRICOT DESSERT WITH TAPIOCA. Ingredients: apricot puree, sugar, tapioca, salt and water sufficient for preparation.

Analysis (submitted by manufacturer).—Total solids 21.74%, moisture 78.26%, ash 0.51%, fat (ether extract) 0.29%, protein (N × 6.25) 0.38%, crude fiber 0.46%, carbohydrate other than crude fiber (by difference) 20.10%.

Vitamins and Minerals	Mg./100 Gm.
Crude carotene	1.5
Thiamine	0.013
Riboflavin	0.023
Nicotinic acid	0.38
Ascorbic acid	0.25
Calcium	21
Phosphorus	16
Iron (total)	0.46
Iron (available)	0.26
Copper	0.40

Calories.—0.85 per gram; 24.1 per ounce.

Use.—For use in the feeding of infants and young children.

H. J. Heinz Company, Pittsburgh.

HEINZ STRAINED ORANGE JUICE FOR BABIES is prepared from Florida oranges. It is processed according to standards adopted by the H. J. Heinz Company. These have been examined and accepted by the Council. The following information was submitted by the company: The juice is finely strained; the peel oil content is maintained at a point below 0.020%; dextrose in small amounts is added for the maintenance of a sugar-acid ratio within specified limits; the product is vacuum packed in 4½ ounce metal containers. The average ascorbic acid (vitamin C) content for the 1951 pack was 51.8 mg. per 100 ml. at the time of packing. The average caloric value is 14 calories per ounce.

M & R Laboratories, Columbus, Ohio.

SIMILAC (LIQUID) comprises partially defatted milk (concentrated by evaporation) with lactose, olive oil, cocoanut oil, corn oil, cocoa butter, fish liver oil concentrate, ascorbic acid, and thiamine.

Analysis (submitted by manufacturer).—Total solids 24.10%, moisture 75.90%, minerals 0.75%, fat 6.80%, protein 3.45%, carbohydrate 13.10%.

Vitamins and Minerals	*Per 100 Gm.*	
Vitamin A	494	U.S.P. Units
Thiamine	0.032	mg.
Riboflavin	0.19	mg.
Ascorbic Acid	9.88	mg.
Vitamin D	79	U.S.P. Units
Calcium	130.00	mg.
Phosphorus	100.00	mg.

Calories.—1.40 per gram; 40 per fluid ounce.

Use.—For use in infant feeding.

STANDARD NOMENCLATURE OF DISEASES AND OPERATIONS, FOURTH EDITION

On Jan. 2, 1952, the American Medical Association will make available to hospitals the new fourth edition of Standard Nomenclature of Diseases and Operations.[1] Revision of this useful book has been under way intensively for the past three years. It began with the decision to revise made at the Fifth National Conference on Medical Nomenclature, held at the Association Headquarters office in June, 1948. Revision of the book was carried out by the editors under the general supervision of an Editorial Advisory Board and in collaboration with 24 committees representing each of the individual or specialty sections of the book.

Since its inception under the auspices of the New York Academy of Medicine, and the First National Conference on Medical Nomenclature, in 1928, and the subsequent transferral of responsibility for its periodic revision to the American Medical Association in 1937, the "Stand-d Nomenclature" has grown rapidly to become the dard, and thereby the most acceptable, system for diagnostic coding of hospital records for more than per cent of U. S. hospitals. Although the dual topographic-etiologic coding system is not uncomplicated, it has demonstrated many times its flexibility both through ease of simplification for the small hospital and in ready expansibility for the large teaching and research hospital.

Because of the wide acceptance of this coding system and the fact that hospital record systems using "Standard Nomenclature" must make the changes provided for in each revision, the editors of the fourth edition have made every effort to avoid changes that were not strictly required. Nevertheless, the rapidly expanding scientific knowledge in many fields in recent years has required a considerable number of changes in several sections of the book. These include a complete revision of the psychobiologic section to bring it into accord with accepted diagnostic terminology of the American Psychiatric Association, a complete revision of the diseases of the hemic and lymphatic section to accord with newer thought in this field, and a complete revision of the section on tumor etiology. Changes in the nomenclature and coding of tumors were preceded by deliberations of the "Standard" committee on oncology with similar committees of the American Cancer Society, the National Research Co cil, the U. S. National Committee on Health and V Statistics, the American Society of Clinical Patholo the Armed Forces Institute of Pathology, the U. S. P Health Service, and others, all of whom have adopted new nomenclature.

For purposes of a closer identification of two sys the fourth edition has included an appendix cross r ence of "Standard" code numbers to code numbe the "International Statistical Classification of Dise Injuries and Causes of Death." The "International" numbers have also been included parenthetically i nomenclature section of the book. The main purpo this has been to simplify the work of hospitals that ticipate in or contribute toward large-scale state, nat or world statistical studies of disease incidence. It be emphasized, however, that for purposes of ho recording the systems are by no means interchang The "Standard" system, as a clinical system, is nec for the proper separation of individual differences i eases for recording and research purposes, where "International" system applies mainly to much br disease groupings for statistical purposes. Thus, on number in the International list may be used to rep 20 or more conditions classified and coded separa the "Standard Nomenclature."

In view of the fact that the International list is n cepted on a world basis for statistical analyses countries participating in the World Health Organi and the fact that the cross coding to "Standard" ha a tremendously detailed and time-consuming w seems pertinent now to suggest that the combin tems, clinical and statistical, would be an appr consideration for the World Medical Associati sponsorship or adoption in either the present or t edition.

Unquestionably, the adoption of "Standard" hospitals of this country not now using it is necessa can be an effective move toward the unity inhe calling the same things by the same names.

LABORATORY-ACQUIRED INFECTIONS

Sulkin and Pike [1] report data collected on labo acquired infections by means of a questionnair mitted to 5,000 laboratories, including those ass with state and local health departments, accredite pitals, private clinics, schools of medicine and vete science, undergraduate teaching institutions, ma turers of biologicals, and various governmental ag The report includes cases reported in the literature. were 1,342 infections presumably acquired as a of laboratory work. Among these there were 39 fat a rate of 3.0%.

The laboratory-acquired infections included 77 terial, 265 viral, 200 rickettsial, 39 parasitic, and to fungi. Brucellosis, tuberculosis, tularemia, typhoi streptococcic infections accounted for 72% of th terial infections and 31% of all infections. Coccid outnumbered all other fungi as a cause of labo infection, apparently because of the highly infe nature of the chlamydospores.

---

[1] Published by the Blakiston Company, Philadelphia.

[1] Sulkin, S. E., and Pike, R. M.: Survey of Laboratory-Acquired Infections, Am. J. Pub. Health 41: 769 (July) 1951.

[he handling of clinical specimens and infected ani-ls or ectoparasites accounted for 175 and 139 cases, pectively. Contamination of air and "work with the ınt" were other frequently recognized sources of lab-tory infection. There were 98 infections acquired in autopsy room. The hypodermic needle and the syringe ounted for the largest number of infections due to ident. Seventy-five per cent of all infections occurred ong trained, scientific personnel, this being the group t is exposed to the greatest risk. Thirteen of the 95 es of hepatitis occurred in dishwashers. Of consider-: importance, the authors emphasize, is the develop-ıt of bacterial hypersensitivity in laboratory workers. : sensitivity may become so pronounced that the ker can no longer engage in this type of work.

Among the prophylactic measures against laboratory ctions, the realization of the dangers and attempts at per techniques play an important part.

ong[2] emphasizes that more attention should be paid, he prophylaxis against tuberculosis, to measures pre-ting contamination of the air. Experimentation has ved that ultraviolet rays have a markedly favorable ct. There does not seem to be a definite attitude with ard to BCG vaccination. Many investigators believe xerts a protective influence; a few think it is harmful. wever, studies on the effect of BCG vaccination in venting infection of medical and nursing personnel e firmly established it as a valuable procedure in tuberculin-negative population of hospitals and tuber-osis sanatoriums. It is urged that, if BCG vaccination ot practiced, tuberculin-negative personnel should be ed with tuberculin periodically. Roentgen examina-ı of all personnel must be carried out at intervals not xceed six months.

The employment of vaccination against some of the ettsiae and passive immunization with hyperimmune ım are mentioned by Smadel[3] as some of the measures e employed. The precautions to be taken naturally y with the type of organism under study.

RCOMA "VACCINE"

According to Lewis and Aptekman[1] of the Wistar titute, Philadelphia, atrophying sarcoma tissue may antigenic and serve to protect the host against growth subsequently implanted viable homologous sarcoma ue. Their experiments were made on young adult rats a strictly inbred strain and a 100% transplantable coma originating in that strain.

Material for their "vaccination" tests was obtained m 10 to 11-day-old sarcoma transplants between the ulders on the backs of rats. These tumors had attained ze of about 50 × 20 × 18 mm. The large blood ves-s that supplied the tumors were located by means of a ght light directed through the skin, and then ligated. e tumors were then drawn into a fold of skin and ured by a clamp; the fold was then sewed off to form ermanent pocket.

Material removed from these pockets two to four days er was of a cherry red color and semisolid consistency. When 0.5 ml. of this atrophying (partially autolyzed) tissue was injected into susceptible rats, a considerable local reaction took place, resulting in the formation of a cyst containing thick turbid material, which was absorbed after 8 to 14 days. This transplanted atrophying sarcoma tissue failed to grow in any of 60 rats thus treated.

Twenty-one to 60 days later the treated rats were challenged by subcutaneous implantations of viable homologous sarcoma tissue. The tumor failed to grow in all 40 rats that had previously received injections of material which had atrophied for three to four days. Serological studies have thus far failed to demonstrate antibodies in the serum of these rats that would account for this acquired sarcoma-immunity.

Experiments in progress suggest that the presence of the infiltrated bloody edema fluid in the atrophying sarcoma tissue may be related to its apparent antigenicity.

POSTGRADUATE CONTINUATION COURSES FOR PHYSICIANS

The semiannual listing of postgraduate continuation courses for physicians, covering the period Jan. 1 to July 15, 1952, appears elsewhere in this issue. These data, prepared as a regular service by the Council on Medical Education and Hospitals, list 836 courses varying in length from a few days to several months. Some are concentrated full-time courses and others are part time. There are opportunities for the physician in general practice as well as for the specialist. Opportunities for this form of study during the period cited are available in 33 states and the District of Columbia. The subjects embrace 45 major areas in the field of clinical medicine and the basic sciences. The increasing number of courses available for continuation study for the general practitioner is of particular interest. A series of courses for military personnel at medical installations is also included.

Medical schools, state medical societies, hospitals, state and city boards of health, and special societies continue to be active in developing this type of continuation training.

Eighty-eight agencies are participating in sponsoring the courses in this listing, including 30 medical schools, 13 hospitals, 10 graduate schools of medicine, 12 special societies, 7 state chapters of the American Academy of General Practice, 4 state medical societies, 4 county medical societies, 4 governmental agencies, 2 health departments, and 2 schools of public health.

The Council endeavors to make this listing as complete as possible. Institutions and organizations whose courses are not included in the present list are invited to furnish the Council with details pertaining to the opportunities that they have developed for continuation study by physicians.

MEDICAL NEWS

CALIFORNIA

Tuberculosis in San Francisco School Children.—A steady decline has occurred in the number of San Francisco children of school age with tuberculosis since intensive case finding was begun in October, 1932. Correspondingly there has been a great decrease in the number exposed as evidenced by the tuberculin test. In 1932 there were 43% positive reactors in the school age group; in 1950 this had decreased to 10%. The decrease in actual cases reached an all time low of 67 in 1950. The Chinese continue to have the highest rate of the nonwhite group, 20.9%. The white population is about seven or eight times that of the nonwhite, but only 49% of the cases were among white children. About 47%, nearly one-half of the cases, occur in the 15 to 19 age group. Every child with a positive tuberculin test has an x-ray and chest examination, a complete history, and a classification by a physician which determines the amount of physical activity advisable. All positive reactors have serial x-ray and physical examinations throughout their entire school life.

FLORIDA

Personal.—Dr. DeWitt C. Daughtry, Miami, has recently been elected president of the Florida Chapter of the American Trudeau Society.

Seminar on Cytology.—The Cancer Cytology Center of the Dade County Cancer Institute in Miami, an affiliate of the Medical Research Foundation of Dade County, has announced its first one-week seminar for physicians to be held at the institute, January 14-19. Instruction will be under the supervision of Dr. J. Ernest Ayre, director of the institute, and its research staff, with more than 20 physicians and scientists on the faculty. The course of instruction will include lectures, demonstrations, and symposiums covering the various branches of medicine as related to cancer, including clinical, cytological, surgical, and histopathological fields. Interested physicians should direct inquiries regarding qualifications, registration, fees, and other etails to the Director of the Dade County Cancer Institute, 155 North West 14th St., Miami. Applications for registration, imited to 35 physicians, will be accepted through January 12.

ILLINOIS

Northwest Territory Centennial Awards.—Northwestern University presented "Centennial Awards for the Northwest Territory" to 100 persons at its Centennial Convocation in Evanston December 2. Nominees for Centennial Awards were selected on the basis that they were living, had achieved prominence in one of the states mentioned, and had made "a substantial contribution to society." They came from Northwest Territory states, Illinois, Indiana, Michigan, Ohio, Wisconsin, and Minnesota. Physicians and medical scientists receiving awards included: Dr. Herman N. Bundesen, president of the Chicago Board of Health; Anton J. Carlson, Ph.D., physiologist, formerly chairman, department of physiology, University of Chicago; Dr. Vernon C. David, formerly chairman, department of surgery, and presently consulting surgeon, Presbyterian Hospital, Chicago; Dr. James B. Herrick, Presbyterian Hospital, Chicago; Roger Adams, Ph.D., head of the chemistry department, University of Illinois, Urbana; Dr. Howard T. Karsner, formerly professor of pathology, Western Reserve University, presently medical research adviser to Bureau of Medicine and Surgery U. S. Navy, Washington, D. C.; Dr. Donald C. Balfour, Mayo Clinic, Rochester, Minn.; Dr. Philip S. Hench, head of the department of rheumatic diseases, Mayo Clinic; Edward C. Kendall, Ph.D., chemist, Mayo Clinic; Dr. William S. Middleton, dean of the Medical School, University of Wisconsin, Madison, Dr. Ralph M. Waters, professor emeritus of anesthesia, University of Wisconsin, Dr. Walter H. Judd, U. S. Representative, Minneapolis.

INDIANA

Personal.—Dr. Harris B. Shumacker Jr. has gone to J
Korea as a consultant to the armed services on the trea
frostbite, a subject on which he has been doing rese
will spend about three weeks with field hospital units i

New Indiana Secretary.—James A. Waggener is the ne
tive secretary of the Indiana State Medical Associat
ceeding the late Ray E. Smith. Mr. Waggener, a form
paperman, had been serving as a field secretary for th
association since May, 1949.

KANSAS

First Color TV Installed in Medical School.—The f
television system to be permanently installed for dai
graduate and postgraduate medical instruction in any
school was demonstrated November 29 at the Univ
Kansas Medical Center. The pioneer black-and-white
stallation two years ago was made possible by sta
conversion to a color television system was made po
private funds. The equipment installed at the medical
the result of two years' cooperation between the Uni
Kansas, Remington-Rand, Inc., the Columbia Bro
System, Inc., and the Wilmot-Castle Light Compan
been under test in the CBS laboratories for several m
the auditoriums and conference room teaching areas
sole-type color TV direct-view receivers, each enabling
students to view the operative field closely in all it
colors. The receiver also reproduces the voice of the
surgeon. The audience can ask questions of the surgeo
the program sound is two-way. An additional installati
the teachers at the transmitting and receiving ends of t
to communicate privately without their remarks bein
to the student audience. Thus, the doctor-instructor a
ceiving end can guide the operating surgeon-lecturer to
choicest field of view from the standpoint of the aud
further extension of this installation to the surgical of
an additional monitor receiver there will allow the p
of surgery to supervise closely the TV teaching whe
instructors are operating and lecturing.

The entire surgical curriculum has been revised so
new color TV can be used to best advantage. At pre
junior medical students studying surgery will be req
attend an hour and one-half session of color TV teach
morning for 5 days a week for the 11 weeks they study
that year. An elective program will continue on the
noon each day for those students free to attend. Color
also been scheduled for use in the next surgical post
course in January. Whenever a case of unusual interest
operating room containing the color camera, a code signa
sent out over the medical center loudspeaker system ca
surgeons' and students' attention to the desirability of
ing to the TV receiver.

Physicians are invited to send to this department items of news of general interest, for example, those relating to society activities, new hospitals, education and public health. Programs should be received at least three weeks before the date of meeting.

NTUCKY

e Medical Election.—At the recent centennial meeting of Kentucky State Medical Association in Louisville, Dr. W. rk Bailey, Harlan, was installed as president. Officers elected e Dr. R. Haynes Barr, Owensboro, president-elect, and Dr. th P. Smith, Corbin, Dr. Thomas Van Zandt Gudex, Louis- , and Dr. R. Ward Bushart, Fulton, vice-presidents. Dr. ce Underwood, Louisville, secretary and general manager he association, was named delegate to the American Medical ociation for a two-year term. Dr. Gaithel L. Simpson, Green- , and Dr. Joe M. Bush, Mount Sterling, were chosen Orator urgery and Orator in Medicine, respectively, and will de- r the annual orations at the 1952 meeting of the association.

RYLAND

lical Book Publishers.—The Williams & Wilkins Company, imore, publishers of medical books and periodicals, have chased the medical book publishing business of Thomas son & Sons, New York. About November 15 all stock was ed to Baltimore, and all orders for Nelson medical books be filled from Baltimore.

ge Health Bureaus.—To improve its services for Baltimore's dren, the city health department has merged the Bureau of ool Hygiene with the Bureau of Child Hygiene under the ction of Dr. Janet Hardy. The Division of School Health has aced the former bureau and is under the direction of Dr. n M. Foord. He began his work on a part-time basis ober 1.

SSACHUSETTS

t Alumni Scholarship Awarded.—The first student to re- e a scholarship award from a $5,000 fund of the Alumni ociation of the Boston University School of Medicine is ight Akers, third year medical student of Los Atlos, Calif. scholarships vary from $200 to $400. The alumni associa- has made available scholarships for students of the Boston versity School of Medicine who have good records, who v good promise, and who can make good use of the fund.

ly of Adrenal Gland in Multiple Sclerosis.—The function he adrenal gland in multiple sclerosis will be investigated at Peter Bent Brigham Hospital, Boston, as a result of a grant 15,000 from the National Multiple Sclerosis Society, New k. The investigation will be under the direction of Dr. rge W. Thorn, physician-in-chief at the hospital. Studies will nade over a one-year period to determine whether a deficient tioning of the adrenal gland is one of the causal factors in tiple sclerosis.

CHIGAN

sonal.—Dr. Frank H. Purcell, Detroit, has been appointed lical director of the Sister Kenny Polio Center at Oakland nty Contagious Hospital, Pontiac. The local center, affiliated the United Health and Welfare Fund of Michigan, gave 0 treatments to patients throughout the state during 1950.

nklin Lecture Series.—Dr. John R. Rees, director of the rld Federation for Mental Health, London, England, was sen as the opening speaker in the annual Leo M. Franklin tures in Human Relations at Wayne University, Detroit. He ured on "Mental Health for the Next Generation" at 8 m. December 1 in the Rackham Memorial Building. The ure series and a memorial professorship were established at yne University in 1949 by the trustees of Temple Beth El in ıor of Leo M. Franklin, who was rabbi of the temple for years before his death. Fritz Redl, Ph.D., professor in the iversity's School of Social Work, is this year's occupant of Franklin Memorial Chair, and under the memorial plan, will be one of the speakers in the series. Other speakers are:

anuary 17, Benjamin M. Spock, University of Pittsburgh.
ebruary 28, Otto Klineberg, Columbia University, New York.
pril 17, Bruno Bettelheim and Allison Davis, University of Chicago.
ay 15, Fritz Redl, Wayne University.

MISSOURI

Diphtheria.—Dr. Buford G. Hamilton, Missouri director of health, has reported to the United States Public Health Service that 30 cases of diphtheria occurred in Kansas City in the 2 weeks ended November 17. All of the cases except 1 were reported from a limited area of the city, and 12 of the patients live in a residential hotel.

NEBRASKA

State Association Postgraduate Program.—The Nebraska State Medical Association conducted six one-day postgraduate courses in different parts of the state December 3-8. Courses which dealt primarily with the heart, cancer, and corticotropin (ACTH) therapy were held in Beatrice, Norfolk, Grand Island, McCook, North Platte, and Scottsbluff. Guest members of the faculty were Drs. Max Cutler, director, Chicago Tumor Institute, and Richard J. Meyer, Armour Laboratories, Chicago; Stuart Abel, Northwestern University, Chicago, and Joseph B. Vander Veer, University of Pennsylvania, Philadelphia. It was the medical association's first venture into this type of postgraduate training. The one-day courses in various parts of the state are aimed at "taking medical education to the doctors," thereby eliminating a good deal of lost time for a physician away from his practice.

NEW YORK

Appoint Pathologist at Brookhaven.—Dr. John Thomas Godwin of New Orleans assumed his post as head of the division of pathology and pathologist at Brookhaven National Laboratory Hospital, Upton, Long Island, succeeding Dr. Sidney C. Madden, who accepted the professorship of pathology at the University of California at Los Angeles. For the past year Dr. Godwin has been pathologist for the Ochsner Clinic and Foundation Hospital in New Orleans, and lecturer in pathology, Tulane University of Louisiana School of Medicine.

Postgraduate Lectures.—Dr. Claude E. Heaton, associate professor of obstetrics and gynecology at New York University College of Medicine, will speak on "Management of Breech Presentation" before the Unity Hospital staff in Brooklyn at 10:30 a. m. December 20 at the hospital. This is part of the instruction provided by the Medical Society of the State of New York in cooperation with the New York State Department of Health.

New York City

School-Hospital for Young Narcotic Addicts.—Riverside Hospital, on North Brother Island in the East River, is being organized as a school-hospital for teen-age narcotics users and addicts. Major alterations are expected to get under way by the end of the year and admission of patients is scheduled to begin April 1. Dr. Jerome L. Leon, deputy medical superintendent of Queens General Hospital, has been appointed medical superintendent of the hospital. During four years in military service, he was assigned psychiatric duties with a general hospital unit which saw two years' duty in the South Pacific. All the resources of the community concerned with the teen-age addiction problem will be centered in the 150-bed facility. The resident professional staff is planned to include a senior psychiatrist, four junior psychiatrists, four psychologists, nine psychiatric social workers, seven recreation leaders, four occupational therapists, and a physical education instructor, in addition to the customary nursing staff. Three chaplains will be assigned to the hospital. Working with the resident staff will be a visiting staff being set up under the department of psychiatry of New York Medical College, Flower and Fifth Avenue Hospitals. The school unit will be staffed and operated by the Board of Education. Office space and facilities will be made available to the several public and voluntary agencies who will assume responsibility for the follow-up work on the young patients. To make sure that the above coordination of community effort is effective, patients will be intensively screened on admission and those who are psychotic or otherwise deemed to be hopeless will be sent to appropriate institutions.

SOUTH CAROLINA

Assembly Studies Mental Health Facilities.—The State General Assembly has created a state committee to study mental health facilities and legislation in South Carolina. The group is inspecting both public and private institutions in the state and will make its report to the General Assembly next year.

UTAH

Personal.—Urs P. Hoessley has been named assistant research professor in the department af anatomy at the University of Utah College of Medicine, Salt Lake City.

New State Health Commissioner.—Dr. George A. Spendlove, who for the last year has been acting director of the state department of health, was named state health commissioner Sept. 7. Dr. Spendlove formerly was with the United States Public Health Service for four years.

VIRGINIA

Appoint Executive Secretary.—Mr. Robert I. Howard has been appointed executive secretary-treasurer and director of public relations for the Medical Society of Virginia. He assumed office October 5. Mr. Howard formerly was assistant to the late Henry S. Johnson, whom he succeeds.

Symposium on Traumatic Injuries.—"Common Traumatic Injuries in General Practice" will be the subject of a conference for general physicians of the state at the University of Virginia Department of Medicine, Charlottesville, January 11. This will be the second in a series of postgraduate symposiums scheduled for the academic year and will be followed by a conference on infectious diseases April 4.

Dr. Meredith Heads Department.—Dr. John M. Meredith has been named professor and head of the department of neurological surgery at the Medical College of Virginia, Richmond, succeeding Dr. Claude C. Coleman, who had resigned (The Journal, July 21, p. 1141). Dr. Meredith was on the teaching staff of the University of Virginia at Charlottesville, from 1937 until he became associated with Dr. Coleman in 1941.

'ASHINGTON

Allen Leaves University for Federal Post.—The Associated Press reported on November 22 that Dr. Raymond B. Allen has resigned as president of the University of Washington to accept an appointment by President Truman as director of the Psychological Strategy Board early in January. Dr. Allen was executive dean of the Chicago colleges of the University of Illinois and dean of the college of medicine before he went to Seattle in 1946. The Psychological Strategy Board directs the government's cold war against Russia and her satellites. It is now headed by Gordon Gray, president of the University of North Carolina, who is understood to be anxious to return to his university post. Dr. Allen has held three national positions during his presidency at the university. He was a member of the Eberstadt Committee of the Hoover Commission, was first director of medical services for the National Military Establishment, and last summer acted as chairman of the Salary Stabilization Board of the Economic Stabilization Agency.

WEST VIRGINIA

Personals.—Dr. Robert T. Stenberg of Richmond, Ind., has been named superintendent of Spencer State Hospital, succeeding Dr. Thomas S. Knapp, who resigned to engage in private practice in South Charleston. Dr. Stenberg has recently been with the Veterans Administration hospitals in Fort Custer, Mich., and at Fort Benjamin Harrison, Ind.——Dr. James A. Haney of Steubenville, Ohio, who has served as health commissioner for Jefferson County for four years, has accepted appointment as assistant superintendent at Hopemont Sanitarium and assumed his duties there December 1. He succeeds Dr. Edwin J. Kroeker, who resigned.——Drs. Grover C. Corder of Jane Lew and William M. Echols of Richwood, members of the Central West Virginia Medical Society, were recently elected to honorary lifetime membership in the West Virginia State Medical A
ation.——Dr. Walter E. Vest, Huntington, who has serv
several years as editor of the *West Virginia Medical Journ*
been reelected a member of the publication committee f
five-year term ending December 31, 1956.

State Society to Distribute Press Code.—The council
West Virginia State Medical Association at the regul
meeting in Parkersburg October 28 directed that the D
Press-Radio Code of Ethics be printed in a form suital
framing and distributed to all members of the state m
association, newspapers, trade and professional journal
broadcasting stations in West Virginia. The code was pr
by a committee headed by Dr. Everett L. Gage, Bluefiel
has been approved by the council, the Journalism Conf
composed of members of the newspaper profession in
Virginia, and by the West Virginia Broadcasters' Asso
The code will be printed and mailed out early in Decem

GENERAL

Society Elections.—The American Public Health Associa
its meeting in San Francisco in October chose the fo
officers for the coming year: Dr. Gaylord W. Anderson,

president-elect; Charles Glen King, Ph.D., New York, tr
and Dr. Reginald M. Atwater, New York, executive se

Meeting on Nervous and Mental Diseases.—The Ass
for Research in Nervous and Mental Diseases will hold
nual meeting December 14-15 at the Hotel Roosevel
York, under the presidency of Dr. S. Bernard Wortis, Ne
The subject of this year's meeting is "Treatment in Psyc
A total of 33 papers to be presented will divide the su
treatment into individual and group psychotherapy;
electrical, and pharmacological treatments, and neur
treatments.

Dearholt Medalist.—Dr. John H. Skavlem, medical dir
Dunham Hospital, Cincinnati, has been named recipien
1951 Dearholt Medal by the Mississippi Valley Confer
Tuberculosis. The medal is given annually by the confer
outstanding contributions to tuberculosis control. Dr. S
who received the award during the recent meeting of t
ference in Chicago, is president of the American
Society, medical section of the National Tuberculosis
tion, and a member of the National Tuberculosis Ass
board of directors. He is also a past president of the
Valley Trudeau Society. Dr. Skavlem served for sever
as a member of the ATS council and advisory board, as
on numerous committees of the society.

Awards in Plastic Surgery.—The Foundation of the A
Society of Plastic and Reconstructive Surgery has ann
its prizes for 1951. The first scholarship was not award
second was given to Dr. Richard B. Stark, New York,
essay on "The Cross-Leg Flap Procedure." Honorable r
was awarded Dr. Kathryn Lyle Stephenson, Santa B
Calif., for her essay on "The Production of Ectopic Car
to Dr. Michael Tempest, Leeds, Yorkshire, England, for a
on "Cross-Finger Flaps in the Treatment of Injuries
Finger Tip," and to Dr. Allyn J. McDowell, North Holl
Calif., for an essay on "Mass Treatment of Burns in
Warfare."

Pamphlet on Glaucoma.—The National Society for the
tion of Blindness, 1790 Broadway, New York, has pu
an eight-page pamphlet on glaucoma and copies are av
without charge. The pamphlet points out that the best
against glaucoma is a thorough eye examination at leas
every two years after the 40th birthday. The three main
to remember about glaucoma are said to be (1) it strike
40 in most cases; (2) it is difficult to detect in early stages
a result many have the disease and do not know it, and (3)
usually be checked if caught early. According to the s
800,000 men and women over 40 years of age are slowly
sight from glaucoma because of ignorance and neglect.
tunately, most of them do not realize that they face blin

iation Research Society.—The formation of this group was
ɔunced November 13 by Gioacchino Failla, D.Sc., professor
adiology and director of the radiology laboratory at the
ımbia University College of Physicians and Surgeons, New
k, at a dinner of the Alumni of the Oak Ridge (Tenn.) In-
te Isotope Training Course. Its objects are to promote
ırch *in the sciences relating to radiation;* to facilitate inte-
on of different disciplines in the study of radiation effects,
to promote the diffusion of knowledge in these fields. Mem-
hip will be limited to those who "have made meritorious
ributions to the advancement of radiation physics, chem-
or biology by independent or original research, or have
ered some other special service to the cause of the natural
life sciences."

\S Meeting in Philadelphia.—The American Association
he Advancement of Science will hold its annual meeting in
adelphia, *December 26-31. The program includes a session*
ıedicinal chemistry December 28. A four-session symposium
\bnormalities of Lipid Metabolism, with special reference
teriosclerosis, will be held December 29-30. There will also
medical scientists' dinner on December 29, at which Mal-
ı *Soule, D.Sc., Ann Arbor, Mich., will deliver* a vice-presi-
ial address. The Oak Ridge Institute of Nuclear Studies will
ɛnt a two-day symposium on Radioisotopes in Medicine on
ɛmber 28, and the program of the Society for Research in
d Development *includes a symposium on Biochemistry of*
ition in Human Growth on December 27. Registration fees
$2 for members of the association and $3 for nonmembers.

arch on Adolescent Problems.—The Austin Riggs Founda-
will make an investigation of the problems of adolescence
tudying children at the Riggs Clinic in Pittsfield, Mass., and
s headquarters in Stockbridge, Mass. Juvenile delinquents
young narcotic addicts who come to the attention of the
ts in Pittsfield will also be included in the study. The Field
ıdation has given $19,800 to carry the project through two
; of its five-year plan. Erik H. Erikson of the foundation
will direct the project. He will also study children at the
hiatric Institute in Pittsburgh. Dr. Robert P. Knight, medical
itor of the foundation, Dr. Joseph O. Chassell, psychiatrist,
garet Brenman, Ph.D., and David Rappaport, Ph.D., Stock-
ge, Mass., all of the foundation staff, will be consultants. The
stigations will cover a study of juvenile delinquency, nar-
s addiction, and all the confusing aspirations and emulations
are found during adolescence.

ntory of Health Research.—The Health Information Foun-
ın is taking a census of health research activities in the
ed States. *Questionnaires have been sent to about a thousand*
iduals and groups connected with universities and colleges,
to government agencies, nurses' organizations, and others.
foundation wants to find out what social science research
ealth has been conducted since 1945, and any major work
: since 1940, especially as related to levels of community
th facilities and services and community participation in
th programs and in health social action programs. Some
he facts sought are the areas covered by these research
ects, research methods used, and plans for publication of cur-
studies. Over a hundred projects have already been reported.
inventory will serve to reduce duplication and to speed up
ıncement of health research. Findings from this census will
ıublished early in 1952 for distribution to health and com-
ıity leaders across the nation. The foundation plans to keep
census current with a new report issued each year.

D. Osborne Fellowship in Dermal Pathology.—This fel-
ship, sponsored by the American Academy of Dermatology
Syphilology, is to provide annually the opportunity for study
training in dermal pathology for one year to a graduate
ent who has completed at least two years of training in
natology or one of its allied branches in accordance with
requirements of the American Board of Dermatology and
hilology. A stipend of $2,000 will be given to the candidate
cted. The period of training will be spent at the Armed Forces
itute of Pathology, Washington, D. C., the appointment be-
subject to approval by the director of the institute. As the
erican Board of Dermatology and Syphilology has approved
the institute for one year of training, the time spent will be accredited by the board. Dermatologists in training who are interested may obtain application blanks for the Earl D. Osborne Fellowship from Dr. Hamilton Montgomery, 102-110 Second Ave., Southwest, Rochester, Minn., Chairman of the Committee on Pathology of the American Academy of Dermatology and Syphilology. The next appointment available begins July 1, 1952.

Pan American Congress.—The third Pan American Congress of Oto-Rhino-Laryngology and Broncho-Esophagology will be held in Havana, Cuba, January 20-24 under the presidency of Dr. Jose C. Gros. Dr. Chevalier L. Jackson, Philadelphia, has been appointed guest of honor of the Cuban Society of Oto-Laryngology. The tentative program lists the following speakers:

Evaluation of Surgery and Irradiation in Treatment of Laryngeal Cancer, Drs. Leborgne, Uruguay, or Baclesse, France; Alonso, Uruguay, and Martin, United States.
Evaluation of Antibodies, Desensitization and Surgery in the Treatment of Sinusitis, *Drs. Hansel, United States; De Lima, Brazil; Schall, United States, and Tato, Argentina.*
Nonmalignant Stenosis of the Esophagus, Drs. Mattos Barretto, Brazil; Barani, Uruguay, and Holinger, United States.

A series of instruction courses will also be given. The official languages of the congress are Spanish, French, English, and Portuguese. There will be a system of simultaneous translation of these languages to English and Spanish. Reservations must be made before December 15 with the general secretary, Dr. Pedro Hernandez Gonzalo, 8 No. 358, Vedado, Havana, Cuba. The inscription fee is $10.

Cerebral Palsy Research Award.—Dr. Samuel P. Hicks, Boston, was recently named the first winner of United Cerebral Palsy's Max Weinstein Research Award for the "outstanding scientific achievement" of the year in the field of cerebral palsy. Dr. Hicks, who is associated with Harvard Medical School and New England Deaconess Hospital, Boston, and with the Pondville Hospital, a state cancer hospital in Walpole, Mass., was selected by a four-man committee 24 hours after he had read a noteworthy paper at United Cerebral Palsy's convention in Philadelphia November 3. He reported findings that, in experimental animals, x-rays and certain chemicals given to mothers could produce damage to the brain such as is seen in cerebral palsy. The Weinstein Award, a plaque and $1,000 in cash, was established with a fund of $10,000 left by the late Max Weinstein, chairman of the Board of Russeks Fifth Ave., New York. The award committee included Dr. Sidney Farber, Children's Medical Center, Boston; Dr. Houston Merritt, director of Neurological Institute, New York, and vice-chairman of the association's medical advisory committee; Dr. Seymour S. Kety, National Institute of Neurological Diseases and Blindness, Bethesda, Md., *and Dr. James L. Wilson, professor of pediatrics,* University of Michigan, Ann Arbor.

Papers for Venereal Disease Symposium.—Investigators with suitable material are urged to submit papers for consideration for the program of the annual venereal disease symposium on "Recent Advances in the Study of Venereal Diseases," which will be held May 1-2, in the Federal Security Building, Washington, D. C. This symposium will again be conducted under the joint auspices of the Experimental Therapeutics Study Section of the National Institutes of Health and the American *Venereal Disease Association and will be held in conjunction* with the annual meeting of the association. Titles of papers proposed along with the list of authors in proper sequence and brief abstracts should be sent in duplicate to Dr. J. E. Moore, 804 Medical Arts Building, Baltimore 1, and Dr. William L. Fleming, 750 Harrison Ave., Boston 18. The deadline for receipt of titles and abstracts will be January 15. Authors will be notified of the action of the joint program committee within a month after the deadline. Information about the symposium may be obtained from Frederick W. Appel, Ph.D., Executive Secretary, Experimental Therapeutics Study Section, National Institutes of Health, Bethesda 14, Md., or from Dr. Fleming, Secretary of the American Venereal Disease Association, at the above address.

Tropical Medicine and Malaria Societies Merge.—A new scien*tific body, the American Society of Tropical Medicine and* Hygiene, has been formed by the amalgamation of the 47-year-old American Society of Tropical Medicine and the 34-year-old

National Malaria Society. The dissolution of the long-established scientific groups was a recognition of the virtual eradication of endemic malaria from this country, officials said. The new American Society of Tropical Medicine and Hygiene was created to succeed them for "the advancement of tropical medicine and hygiene, including medicine, nursing, engineering, entomology, parasitology and allied specialties in this field." Martin D. Young, Sc.D., Columbia, S. C., of U. S. Public Health Service, was elected president of the new society. Dr. William A. Sodeman of New Orleans and the Tulane University of Louisiana School of Medicine, was named president-elect, and H. W. Van Hovenberg of Mount Pleasant, Texas, was elected vice-president. Galveston, Texas, was chosen as the place of the first meeting sometime in 1952. The American Society of Tropical Medicine and the National Malaria Society met jointly in Chicago in November with the American Academy of Tropical Medicine and the American Society of Parasitologists, two organizations which are not affected by the merger.

Symposium on Premedical Education.—Alpha Epsilon Delta, national premedical honor society, in cooperation with the American Association for the Advancement of Science (Section K, Subsection Nm-Medicine), the American Society of Zoologists, and Beta Beta Beta biological fraternity, will conduct a symposium at the Benjamin Franklin Hotel, Philadelphia, December 28, on "Premedical Education and Social Health." The program will include the following speakers: Hugh E. Setterfield, Ph.D., professor of anatomy, School of Medicine, Ohio State University, "Introductory Remarks"; Dr. John McK. Mitchell, dean of the School of Medicine, University of Pennsylvania, "Social Problems in Medicine"; Dr. Maurice H. Greenhill, associate professor of psychiatry, The Duke University School of Medicine, Durham, N. C., "Health Problems of Social Origin," and Luther E. Woodward, Ph.D., coordinator, New York State Department of Mental Hygiene, "Emotional Factors in Social Health." Attention will be focused on medical problems which emphasize the importance of social sciences in the premedical educational program. Persons interested in premedical education and student guidance are invited. Reservations for the luncheon (price $3) may be made in advance by writing to Maurice L. Moore, Ph.D., 37 Whitemarsh Road, Ardmore, Pa.

Report of Commonwealth Fund.—According to its annual report made public November 19, the first goal of the Commonwealth Fund at present is the better teaching of doctors. Gifts for this purpose accounted for $1,008,242.50 out of the year's total appropriations of $2,879,383.99. The fund made grants during the year to seven institutions. The largest, $344,725, went to Cornell University Medical College for three years' support of a clinic for comprehensive medical care in the outpatient department of New York Hospital, to which medical students will be assigned for half their senior year. The grant also continues partial support of a special clinic which is training teachers and conducting research in psychosomatic medicine. The aim of this plan is to give the student time to see the same patient repeatedly and so to get a better idea of health and sickness as a continuing experience rather than a succession of unrelated episodes. A grant of $264,912 went to the University of Colorado School of Medicine for the first three years of an experiment intended "to demonstrate the practice of good general medicine." At the Denver General Hospital students will have consecutive experience in the care of patients for at least two years. Grants to the department of rehabilitation and physical medicine of the New York University College of Medicine and to the University of Cincinnati College of Medicine were designed to strengthen medical care by skilful attention to the patient's emotional needs. Renewed support was given to a regional postgraduate educational service of the Medical College of Virginia and the University of Virginia. The fund will contribute to the cost of training scientists for medical research at the Massachusetts Institute of Technology for the next five years, and is helping in the development of field training at the Harvard School of Public Health.

Appropriations for experimental health services, including public health and hospital activities, amounted to $679,471.84. The largest new grant in this field was for a study of family experience with medical care under the Health Insura
of Greater New York and in a comparable sample of N
families outside that plan. Studies of schizophrenia a
University of Louisiana School of Medicine headed th
13 grants for medical research amounting to $454,768
vanced fellowships in medicine, offered primarily to
in medical schools, were awarded to 19 Americans. Th
of the fund has been increased to $81,000,000 through
mination of a trust established by Edward S. Harkness
bequest from Mrs. Harkness, who also left the fund
at 1 East 75th St., New York. This is being altered to
headquarters for the fund's operations.

PAN AMERICAN CONGRESS OF OTORHINOLARYNGOLOGY AND BRONCHOESOPHAGOLOGY, Havana, Cuba, Jan. 20-24.

DEATHS

Acuff, Herbert ⊕ Knoxville, Tenn.; born in Washburn, Tenn., Aug. 22, 1886; University of Louisville (Ky.) Medical Department, 1911; also a graduate in pharmacy; president since 1950 and treasurer from 1946 to 1948 of the International College of Surgeons, since 1947 founder fellow of its qualification board, and president of the United States Chapter from 1946 to 1948; life fellow of the American College of Surgeons and the Southeastern Surgical Congress, of which he was president in 1947-1948; in 1945-1946 member of the board of directors of the American Cancer Society and since 1945 member of the board of directors and service director of the Tennessee Division; member of the American Association of Railway Surgeons, the American Goiter Association and the United States Committee, Inc., of the World Medical Association, the Civitan Club (international president, 1926-1927), and past president of the Knoxville Academy of Medicine; associate member of the American College of Chest Physicians; honorary fellow of the Surgical Society of Rome, Italy, Piedmontese Society of Torino, Italy, Medical and Surgical Society of São Paulo, Brazil, Societa Tosco-Umbra de Chirurgia, and Sociedad Mexicana de Estudios Anatomicos y de Tecnica Operatoria; received degree of honoris causa from University of Buenos Aires; served as a major in the medical corps of the United States Army during World War I; since 1945 secretary of the International Board of Cancerology; member of the Tennessee Hospital Board and the Tennessee Hospital Licensing Board; visiting surgeon, Fort Sanders, East Tennessee Baptist, and Knoxville General hospitals; consulting surgeon and chairman of the operating committee of the Beverly Hills Sanatorium; chief-of-staff, St. Mary's Memorial Hospital; president and surgical director of the Acuff Clinic; surgeon, Southern Railway System; chief consulting surgeon since 1915 of the Pruden Coal and Coke Company; active in starting the University of Tennessee Atomic Energy Research Center and Hospital; contributed many papers to medical literature on various surgical subjects; died November 2, aged 65, of coronary disease.

gers, Edward James, Pittsford, Vt.; born in Ninety Six, S. C., 1877; Medical College of the State of South Carolina, Charleson, 1908; Columbia University College of Physicians and Surgeons, New York, 1912; assistant professor emeritus of clinical medicine at the University of Vermont College of Medicine in Burlington; member of the American Trudeau Society, American Medical Association, International Union Against Tuberculosis, and the National Tuberculosis Association; past president of the Vermont State Medical Society and the Eastern Division of the American Sanatorium Association; for many years a member of the state board of health, serving as chairman from 1925 to 1931; advisor to the state department of public welfare from 1923 to 1938; at one time represented Pittsford in the state legislature; for many years medical director of the Washington County Sanatorium in Barre and of the Caverly Preventorium and superintendent and medical director of the Vermont Sanatorium; received the honorary degree of doctor of science from Middlebury College in Middlebury; died in Rutland (Vt.) Hospital October 22, aged 74.

Bonynge, Charles William ⊕ Los Angeles; University of Southern California College of Medicine, Los Angeles, 1903; clinical professor of medicine (public health and preventive) at his alma mater; specialist certified by the American Board of Pathology; director of the laboratory of the Certified Milk Commission; president of the American Association of Medical Milk Commissions from June, 1944, to June, 1945; consulting pathologist at Children's Hospital, Los Angeles General Hospital and St. Vincent's Hospital, where he died October 7, aged 71, of ruptured abdominal aneurysm.

Ashbaugh, Roy Asquith, Riverton, Wyo.; Chicago College of Medicine and Surgery, 1914; member of the American Medical Association; died September 19, aged 64.

Blankfeld, Nathan ⊕ Brooklyn; University of Bellev pital Medical College, New York, 1927; member of the A can Academy of Opthalmology and Otolaryngology; fe the American College of Surgeons; specialist certified b American Board of Otolaryngology; served during Worl II; on the staffs of Kings County Hospital, St. Peter's Ho Samaritan Hospital, and Midwood Hospital, where h November 1, aged 50.

Blashill, James Bernard ⊕ Grosse Pointe Park, Mich.; U sity of Michigan Medical School, Ann Arbor, 1930; during World War II; on the staffs of East Side Genera pital and Alexander Blain Hospital in Detroit; died Octo aged 47, of amyotrophic lateral sclerosis.

Bowen, Emmett William, Watertown, Wis.; Marquette U sity School of Medicine, Milwaukee, 1915; member American Medical Association; served during World Wa filiated with St. Mary's Hospital; died September 3, a of coronary occlusion.

Boynton, Ray D., Wisconsin Dells, Wis.; Marquette Un School of Medicine, Milwaukee, 1913; served as health affiliated with Reedsburg (Wis.) Municipal Hospital Mary's Ringling Hospital in Baraboo; died August 28, a of injuries received in an automobile accident.

Butman, William Charles, Hebron, Ind.; Southwestern pathic Medical College and Hospital, Louisville, Ky. member of the American Medical Association; served dent of the Porter County Medical Society; died Septem aged 71, of heart disease.

Hill, Elmer ⊕ Walla Walla, Wash.; Kansas Medical Medical Department of Washburn College, Topeka, 1 low of the American College of Surgeons; for many yea cian at the state penitentiary; on the staffs of the Wall General Hospital and St. Mary's Hospital, where he d tember 3, aged 69, of coronary occlusion.

Hughes, William H., Mitchellville, Md.; Leonard School, Raleigh, N. C., 1897; died in Freedmen's Hospita ington, D. C., September 29, aged 81.

Hupe, Charles, Lafayette, Ind.; Ernst-Moritz-Arndt U tät Greifswald Medizinische Fakultät, Greifswald, Germany, 1882; member of the American Medical Ass for 46 years treasurer of the Tippecanoe County Med sociation; for many years on the staff of St. Elizabeth where he died September 18, aged 94, of pneumonia f a fractured hip received in a fall.

Kavanagh, Thomas Stephen, New Orleans; Medical Dep of Tulane University of Louisiana, New Orleans, 1901; of the American Medical Association; died October 7, of bronchopneumonia, pyelonephritis, and prostatic carcinoma.

Keating, John Joseph, New Milford, Conn.; Univers Bellevue Hospital Medical College, New York, 1934; of the American Medical Association; served during Wo II; died October 8, aged 42.

Kerrigan, George Peter, St. Petersburg, Fla.; College o cians and Surgeons of Chicago, School of Medicine of t versity of Illinois, 1901; died in Little Company of Ma pital November 1, aged 82.

Kirschner, William Lee, New York; University and Hospital Medical College, New York, 1919; member American Medical Association and the American Soc Anesthesiologists; associated with St. Francis Hospit September 18, aged 57, of heart disease.

Lane, Warner Durelle, Romeo, Mich.; Detroit College o cine and Surgery, 1919; member of the American Medi sociation; died in Detroit August 1, aged 57, of bronc carcinoma.

⊕ Indicates Fellow of the American Medical Association.

terbach, William Frederick, Dayton, Ohio; College of sicians and Surgeons of Chicago, School of Medicine of the iversity of Illinois, 1905; served during World War I; died ober 2, aged 70, of coronary thrombosis.

r, Graham MacAllister, Elgin, Ill.; Barnes Medical College, Louis, 1911; member of the American Medical Association; iated with St. Joseph Hospital and Sherman Hospital, where died August 30, aged 63, of cardiac decompensation.

e, John Franklin, Lancing, Tenn.; Lincoln Memorial Unisity Medical Department, Knoxville, 1910; died in Fort San- Hospital, Knoxville, October 3, aged 71.

Lemore, William Thomas, Courtland, Va.; University Col- of Medicine, Richmond, 1899; member of the American dical Association; died September 29, aged 77, of a heart ck.

y, Robert John ⊕ Cleveland; University of Wooster Medical artment, Cleveland, 1906; specialist certified by the Ameri- Board of Radiology; member of the American Roentgen Society, Radiological Society of North America, of which vas past president, secretary, and for several years one of the ctors, and the American College of Radiology; head of the artment of Radiology, St. Luke's Hospital, from 1914 to 6; died October 17, aged 72, of coronary thrombosis.

ore, Marshall Abner ⊕ Montgomery, W. Va.; Medical Col- of Virginia, Richmond, 1915; member of the Industrial dical Association; past president of the Fayette County dical Society; served during World War I; died October 29, d 62, of coronary occlusion.

fey, Herbert William ⊕ New Brunswick, N. J.; University Pennsylvania School of Medicine, Philadelphia, 1914; fellow the American College of Surgeons; past president of the iety of Surgeons of New Jersey; for many years trustee of Medical Society of New Jersey; served overseas during rld War I; on the staff of the Middlesex General Hospital, re he died October 26, aged 64.

lis, William Henry, St. Augustine, Fla.; Long Island College spital, Brooklyn, 1895; served during World War I; formerly cticed in Brooklyn, where he was on the staff of Kings County spital; died in Flagler Hospital October 4, aged 79, of coro- y thrombosis.

vnam, John Russel ⊕ Cheyenne, Wyo.; Indiana University ool of Medicine, Indianapolis, 1919; served during World r II; died August 24, aged 57, of coronary thrombosis.

rden, Benjamin L., Portland, Ore.; University of Oregon dical School, Portland, 1907; served during World War I; mber of the staff of St. Vincent's Hospital; died October 19, d 72, of acute coronary thrombosis.

tter, Roscoe James ⊕ Clarksburg, W. Va.; Medical College Virginia, Richmond, 1910; served during World War I; affil- d with St. Mary's Hospital; died in the Medical College of ginia Hospital Division, Richmond, October 27, aged 65, coronary thrombosis.

k, Samuel Nelson ⊕ West Grove, Pa.; University of Penn- vania School of Medicine, Philadelphia, 1921; died October aged 55, of coronary thrombosis.

rson, Herbert Seymour ⊕ New York; University and Belle- Hospital Medical College, New York, 1920; died in morial Hospital October 6, aged 56, of coronary occlusion.

st, Woodruff Law ⊕ New York; Trinity Medical College, ronto, Canada, 1897; served with the Canadian Army Medical rps during World War I; died in Roosevelt Hospital October aged 77.

rvis, Otis H., Cheraw, S. C.; Medical College of the State South Carolina, Charleston, 1911; member of the American edical Association; died September 20, aged 62, of myocardial ufficiency.

mes, John R., Mount Vernon, Ind.; Indiana University School Medicine, Indianapolis, 1908; member of the American Medi- Association; died in the Albert Merritt Billings Hospital, icago, October 25, aged 70, of carcinoma of the prostate.

Reynolds, Stephen Dowell, Plattsburg, Mo.; Ensworth Medical College, St. Joseph, 1890; member of the American Medical Association; formerly county coroner; served during World War I; died in St. Joseph's Hospital, in St. Joseph September 25, aged 82, of cerebral hemorrhage.

Rhodes, Joseph Winfield, Hayti, Mo.; University of Louisville (Ky.) Medical Department, 1910; died September 22, aged 69, of pneumonia.

Robicsek, Hans, New York; Medizinische Fakultät der Universität, Wien, Austria, 1920; member of the American Medical Association; on the staff of the New York Polyclinic Medical School and Hospital; died in Mount Sinai Hospital October 24, aged 58, of coronary thrombosis.

Russell, Clyde, Fork Ridge, Tenn.; University of Louisville (Ky.) Medical Department, 1910; member of the Kentucky State Medical Association and the American Medical Association; served during World War I; died September 2, aged 64.

Schoolar, Thornley Edward, Randolph, Ala.; University of Nashville (Tenn.) Medical Department, 1892; Vanderbilt University School of Medicine, Nashville, Tenn., 1892; member of the American Medical Association; died in Selma August 30, aged 82, of coronary occlusion and generalized arteriosclerosis.

Shenfeld, Isaac ⊕ Atlantic City, N. J.; University of Odessa Faculty of Medicine, Russia, 1922; died September 24, aged 59, of acute coronary occlusion.

Shoales, Walter Addison, Norwich, N. Y.; Cornell University Medical College, New York, 1899; member of the American Medical Association; died September 14, aged 78, of cardiac failure.

Staads, Soeren Wilhelm, Los Angeles; German Medical College, Chicago, 1892; died September 20, aged 82.

Steele, Howard Russell, Ashland, Ky.; Cincinnati College of Medicine and Surgery, 1898; died September 1, aged 78, of myocardial failure.

Tauber, Kurt Stephan, Milbank, S. D.; Medizinische Fakultät der Universität, Wien, Austria, 1925; member of the American Medical Association; died in St. Bernard's Providence Hospital August 2, aged 50, of carcinoma of the colon.

Thexton, Louis, Highland Park, Fla.; Rush Medical College, Chicago, 1891; died in Lakes Wales, August 1, aged 85, of coronary occlusion.

Whichard, Murray Parmer ⊕ Edenton, N. C.; University of Maryland School of Medicine, Baltimore, 1910; served as Chowan and Craven counties health officer; died August 28, aged 63, of arteriosclerotic heart disease.

DIED WHILE IN MILITARY SERVICE

Brown, Omar Jesse ⊕ Captain, U. S. Navy, Norfolk, Va.; born in Bombay, N. C., July 30, 1902; George Washington University School of Medicine, Washington, D. C., 1929; commissioned a lieutenant (jg) in the medical corps of the Navy in 1929; served his internship at the Naval Hospital in Washington, D. C.; following various assignments, ashore and afloat, was assigned to malaria control work at Marine Corps installations in North Carolina during 1941-1943 and for outstanding performance of duty during this period was commended by Secretary of the Navy; from 1943 to 1945 was in charge of the Navy's epidemic disease control board at the Bureau of Medicine and Surgery; engaged in similar work in the Pacific during World War II; in addition to the Commendation Ribbon, was awarded the American Defense Service Medal, American Area Medal, Asiatic-Pacific Area Medal, Philippine Liberation Medal, and the World War II Victory Medal; specialist certified by the American Board of Pathology; fellow of the American College of Physicians; staff medical officer of the Fleet Marine Force, Atlantic; died in Georgetown University Hospital, Washington, D. C., July 7, aged 48, of acute renal insufficiency following an injury due to a fall.

GOVERNMENT SERVICES

AIR FORCE

Officers Complete Preventive Medicine Course at Tulane.—The first class of medical officers to complete a course in preventive medicine in an Air Force-sponsored curriculum at a civilian public health school has graduated at Tulane University Medical School, New Orleans. The three-month course covered basic principles of preventive medicine, epidemiology, biostatistics, and sanitation. Among the graduating officers were a number who had recently completed their intern training under Air Force auspices in approved hospitals throughout the United States. The balance of the class were assigned from duty stations.

Dr. Waldo Treuting, professor of public health administration, was director of the course. Among the speakers at the graduation ceremony, were Dr. R. L. Pullen, vice-dean of Tulane University School of Medicine; Brig. Gen. Earl Maxwell, director of professional services for the Air Force Surgeon General; Col. F. L. Duff, chief of preventive medicine, Col. R. B. Jones, chief of medical education division, and Lt. Col. John Rizzolo, chief, preventable diseases branch, office of the Surgeon General.

Aviation Medical Examiner Class.—An aviation medical examiner class, including British and Egyptian medical officers, a Belgian, and 76 U. S. Air Force Medical officers, received diplomas November 24 at graduation exercises at the Air Force School of Aviation Medicine, Randolph Field, Texas. It was the largest aviation medical examiner class since World War II.

The graduation address was delivered by Dr. Chauncey D. Leake, vice-president of the University of Texas and dean of its medical branch at Galveston.

Although the U. S. Air Force officers are not eligible for the rating of flight surgeon until they have completed additional ervice and requirements, the four foreign officers were awarded ight surgeon wings on graduation. This is a customary courtesy extended to foreign officers. The U. S. officers will obtain their Aviation Medical Examiner ratings after they complete a three month supervised preceptorship in the field, conduct 50 physical examinations for flying, and log 25 hours of flying time in military aircraft. As aviation medical examiners their primary duty will be to conduct physical examinations for flying.

Personal.—Col. Oscar S. Reeder has been appointed Chief of the Medical Consultants Division for the Office of Air Force Surgeon General, replacing Col. John F. Dominick, who has been assigned to headquarters of the U. S. Air Force in Europe as Chief of the Professional Services Division.

NAVY

Tulane and Navy Air School Affiliate.—Articles of affiliation between Tulane University of Louisiana and the U. S. Naval School of Aviation Medicine at Pensacola, Fla., were signed on Nov. 16. Tulane graduate students will continue their research activities at the naval school, and naval flight surgeons and other faculty members may earn academic credit from the graduate school of Tulane University for research work. This mutually desirable relationship culminates a number of years of less formal association.

This joining of professional efforts was a highlight of a two-day conference at Pensacola attended by a number of important figures in naval aviation medical research. The panel discussed problems in aviation medical research, selection and training of naval aviators, unusual physiological stresses in flight, and the general problems of aging. The conference was concluded with a cocktail party and banquet at Mustin Beach at Pensacola.

PUBLIC HEALTH SERVICE

Medical Examination Stations in Europe.—Four Public Health Service officers have received overseas assignments recently to medical examination stations of the Division of Foreign Quarantine. Dr. Maurice A. Sislen was sent to Frankfurt, Germany, as Tuberculosis Consultant for the European program and displaced persons and regular immigration program. Drs. R[illegible] M. Farrier and Patrick J. Sullivan have been assigned as medical officers in charge of examination stations in Salzburg, Austria, and Stuttgart, Germany. Dr. Harry F. Colfer is now medical officer in charge of the London station. A total of 15 Public Health Service officers are at these foreign quarantine [illegible] throughout Europe, maintained to examine immigrants and displaced persons applying for visas to enter the United States. These examination stations are located in the American embassies in Paris, London, and Athens, and in the consulates in Liverpool, Naples, Rotterdam, Frankfurt, Munich, Stuttgart, Berlin, Bremen, Hamburg, Salzburg, and Vienna. Examinations of displaced persons are also conducted in nine Resettlement Centers in Bagnoli, Italy; Funk Kaserne, Ludwigsburg, R[illegible] and Wentorf, Germany; Innsbruck, Kapfenburg, Linz, and Villach, Austria; and one ethnic German center in Hanau, Germany. All but one of these centers are staffed by local physicians who have been selected for their experience in psychiatry and the reading of tuberculosis films. They are supervised by Public Health Service officers from the consulates.

Arctic Research Center.—Dr. Edward T. Blomquist has been appointed Medical Officer in Charge of the Arctic Health Research Center of the Public Health Service, at Anchorage, Alaska. He succeeds Dr. Jack C. Haldeman, who has been appointed Chief of the Division of State Grants of the Public Health Service in Washington.

This research center is engaged in basic and applied research on public health problems peculiar to low temperature areas. At present, tuberculosis is the principal disease problem in the territory. Results of studies conducted by the center are made available to agencies and organizations engaged in the improvement of public health in the territory. The center has been in operation for three years.

MISCELLANEOUS

Greek Medical Technicians to Be Trained in United States.—Assistance to improve the public health service of Greece has been extended to bring 11 specialists to this country for advanced study. The United States has been assisting in Greece's efforts to make up the loss of medical research and training suffered during the war. The current project is the third effort in the field on behalf of Greece.

Under the first part of the American aid program, sponsored by the Economic Cooperation Administration's technical assistance program and the United States Public Health Service, 15 experts in public health, tuberculosis control, nursing, sanitary engineering, laboratory research, and hospital construction were sent to Greece. This project is not completed. In the second part of this ECA program, 21 Greek physicians and other public health specialists came to the United States last year for advanced training in the same fields, and also in nutrition and orthopedics. Eighteen of this group have completed their studies and returned to Greece. Three of the 11 additional Greek specialists to be given training in the United States under the extension of the program have begun their studies. The eight other Greek trainees under this project are expected to arrive for their studies after the first of the year.

FOREIGN LETTERS

ALY

ernational Medicosurgical Meetings.—A conference on umatism was held in association with the international medisurgical meetings of Turin, in Acqui, a center of studies of umatology for many years. Numerous Italian and foreign cialists attended the meetings (chairman, Prof. Robecchi).

Nonarticular Rheumatism and Syndrome Due to Fluid Retion.—The report on this subject was presented by Prof. S. C. Copeman of London. This obscure painful syndrome generally called nonarticular rheumatism. Recently some thors have preferred to use the word fibrositis, but this term being abandoned since it suggests that the condition is always rotic in nature, whereas spasm of the muscle fibers and psychoic rheumatism have also been considered as causes of the ndition. Thus, recent electromyographic studies indicate that tain soft, palpable nodules represent the objective manifestan of spasm of muscle fibers. Presumably this condition results m the irritation of the posterior nerve roots by small lesions alized within or around the spinal cord, such as arthritis of intervertebral articulations or a lesion of the disks. These ft and palpable nodules sometimes disappear with heat, masge, or local injections of procaine hydrochloride. With regard the hypothesis of fibrositis, Stockman, in biopsies of painful eumatic nodules, found inflammatory hyperplasia of the fibroaline tissue. These nodules may be the result of infection or auma and the term fibrositis may correctly be given to this rm of nonarticular rheumatism. Professor Copeman observed at, during the course of various febrile diseases, well localized d tender areas may appear. These become painless when the tient's temperature is restored to normal.

With regard to psychogenic rheumatism, it should be pointed t that the appearance of a varying pain is frequent in psychourotics. Generally the pain is not attributable to nodules but pears in the tendinous insertions of certain muscle groups. is possible that, in addition to the aforementioned causes of in, toxemia elicited by a focal infection may cause chronic in. According to the speaker, even the adipose tissues may cit a painful syndrome classifiable as nonarticular rheumatism. considerable importance is the tension syndrome, a painful ndition due to the periodic swelling of the deep adipose tissue certain locations where the fat lobules are confined by indissible fibrous tissue. Because the pain is secondary to fluid tention in the deep adipose tissue, Prof. Copeman tried treat the syndrome by a reducing diet and by stimulation of uresis. Results were poor. He was unable to aggravate the nsion syndrome in previously affected patients by administran of desoxycorticosterone, the hormone that elicits retention sodium and water.

Acroparesthesias.—Prof. F. Françon of Aix-le-Bains reported acroparesthesias, a clinical syndrome characterized by resthesias of the fingers. They appear almost exclusively in omen, during the night, and disappear if special measures are ken. In moderate cases of total acroparesthesia there is a nctional syndrome associated with less important physical anifestations. In the case of the functional syndrome, the atient is awakened almost every night, at about 3 a. m., by an normal sensation localized in one or both upper extremities nd accentuated at their ends (acro).

At first there is paresthesia with numbness, formication, and eedles and pins" at the tip of the fingers and in the palms. he hands are numb and torpid and almost always seem swollen. he movements are hindered. Often pain and sense of constricon are present. The syndrome is in general of short duration. he physical manifestations are rare, because generally there is o vasomotor disturbance; sometimes there is infiltration in the ngers and dilatation of the veins of the hand and of the sublavicular region. Sometimes Raynaud's syndrome, acrocyanosis, leberden's nodes, or Bouchard's nodes are associated. The general condition is completely unimpaired. Laboratory signs and roentgenologic findings are infrequent. Accurate examination of the cervical region is important. The chronic form of the condition if untreated, may last 10 or more years. When treated, response is generally good, because there is a natural tendency to recovery.

Total acroparesthesia and radicular acroparesthesia have long been differentiated clinically. The former attacks the entire hand and all the fingers and is often associated with manifestations involving the supraclavicular region. The radicular forms resemble cervicobrachial neuralgias. In addition to disturbances of the tendon and the periosteal reflexes, there may be motor disturbances: these manifestations reveal that a nerve root has been injured in some part of its pathway. Sometimes there is the so-called scalenus anterior syndrome, and sometimes, a particular syndrome that Bonduelle has called postural syndrome of the supraclavicular fossa. With regard to pathogenesis, the cause of total acroparesthesia is attributed to autonomic imbalance, while radicular acroparesthesia is believed due to prolonged nervous irritation.

Endocrine Osteoses.—Prof. E. Martin from Geneva drew attention to the incidence of the osteopathies and the complexity of the pathogenetic factors of many of them, including deficient secretion of an endocrine gland—thyroid, hypophysis, gonads, or the adrenals. In skeletal diseases of endocrine origin there are often generalized bone lesions. These osteopathies are not easily detected by macroscopic examination of the bone in autopsy, but only by histological examination.

It is important that the endocrine factor be recognized in a generalized osteopathy.

FINLAND

No Bovine Tuberculosis in Finland.—The immunity to bovine tuberculosis enjoyed by Finland at present is the outcome of much laborious research and administrative enterprise. It is probable that this disease was first introduced into the country a century ago with the import of diseased cattle from abroad. In 1891 tuberculin testing of cattle was started, and in 1894 it was found that 25% of 2,219 cattle gave a positive reaction. By 1897 more than 10,000 cattle had been tested, of which 18.6% had given a positive reaction. Bang's system of isolating positive reactors was adopted, at great cost to the owners. In 1904 compulsory measures were introduced for stamping out bovine tuberculosis, and Bang's system was adhered to on the assumption that it would soon prove completely effective. However, between 1916 and 1928 the decline in percentage of positive reactors was disappointingly slow; it ranged between 4% and 7%. The adoption in 1923 of compulsory control of slaughtered cattle led to a disquieting and at first inexplicable discovery. In this year only 0.15% of the cattle examined post mortem showed signs of tuberculosis, whereas 8.5% of the tuberculin-tested cattle gave a positive reaction. Many positive reactors were found at autopsy to show no other sign of tuberculosis, and both veterinary surgeons and owners came to distrust the tuberculin test as an effective aid to the eradication of bovine tuberculosis.

At this stage a veterinary expert, R. Stenius, was called on by the Finnish Ministry of Health to investigate this curious disproportion between tuberculin and postmortem findings, and in 1928 he set to work on his task. In one herd he found only three positive reactors. They were calves, one of which he was allowed to slaughter. The postmortem findings were almost negative, only a few lymph nodes being swollen. Inoculation tests of experimental animals ultimately yielded tubercle bacilli of the human type. This observation led to the discovery that the calf had been in the care of a person who had subsequently died of pulmonary tuberculosis. This clue has led to a whole series of observations associating positive tuberculin reactions in cattle with open tuberculosis in human beings tending them. It was found that, when a tuberculous person had been in contact for

---

ho items in these letters are contributed by regular correspondents in e various foreign countries.

some time with a hitherto tuberculin-negative herd, some of its members, calves in particular, began after a few months or years to give positive reactions, usually slight. Such positive reactors showed no macroscopic evidence of tuberculosis, and they tended to become tuberculin-negative some time after contact with a tuberculous person had ceased.

The avian type of tubercle bacillus can also render cattle tuberculin-positive. In such cattle there develops either an inactive and latent tuberculosis or an active form of the disease with the development of definite foci. Veterinary surgeons are now applying tuberculin tests designed to distinguish among the bovine, human, and avian types of infection. A test indicative of a bovine infection calls for radical measures, whereas the demonstration of a human type infection requires only the removal of the infecting person, the cow in question being allowed to eliminate the infection in her own good time. The demonstration of the avian type should lead to the discovery and slaughter of tuberculous fowls.

Although infection of cattle with the bovine type has now been stamped out in Finland, cattle are still being tested with tuberculin, partly on the chance that infection with the bovine type may crop up again sporadically in cattle, partly because tuberculin testing of cattle has proved to be an effective means for discovering hitherto undetected cases of infection of human beings with the human type of bacillus.

Domiciliary Treatment of Scarlet Fever.—An outbreak of scarlet fever in Aabo in the autumn of 1950 gave Dr. Leena Leisti and Dr. Wickström an opportunity to test the efficacy of treatment of the disease in the patients' homes. Their observations are recorded in the journal of the Finnish Medical Association, a publication incorporated with other Scandinavian medical journals in *Nordisk Medicin*. This test was promoted by a threatened shortage of hospital beds and by the comparative mildness of the scarlet fever which was epidemic in Finland at the time. When a new case was reported to the polyclinic of the municipal fever hospital of Aabo, a nurse was sent to the home to take swabs of all its occupants, to give instructions with regard to isolation and disinfection, and to administer penicillin (procaine-penicillin by intramuscular injection). At first four injections were given on different days; later, only three injections. When the number of injections was reduced to two, the results were less satisfactory. Later in the epidemic the administration of penicillin was revised to simplify matters, a single injection being followed by the administration of penicillin by mouth on successive days. This single injection consisted of 150,000 units for children up to 5 years of age and 200,000 for children aged 6 to 10 years. The dosage by mouth was 75,000 units for children up to 5 years of age.

Between the middle of October and the end of December, 1950, there were 203 cases of scarlet fever and 121 cases of streptococcic sore throat treated at home, while at the same time 228 cases of scarlet fever and 65 cases of streptococcic sore throat were treated in hospital. Both the home-treated and hospital-treated cases were kept under bacteriologic control with results indicating no differences of statistical significance between the two. Another statistical comparison was made between the home-treated cases in which penicillin was given by injection alone and the home-treated cases in which combined treatment (penicillin administered by a single injection followed by its oral administration) was given. Here again there was no statistically significant difference. The combined treatment would therefore seem to be the better of the two, because of its greater simplicity. The authors of this report stress the complexity of the problem concerned with Streptococcus carriers, and they hope in the near future to issue a new report on the subject.

The New Medical Faculty at Aabo.—As far back as 1642 there was a medical faculty at Aabo, which at that time was the capital of Finland. The town fell on evil days in 1827, when it was devastated by fire and robbed of its rank as the capital of Finland in favor of Helsingfors, which was henceforth to be the metropolis. On regaining her independence in 1917, the country experienced a revival, which in Aabo took the form of great academic activity. Finland is bilingual, with two widely different languages, Swedish and Finnish. In 1918 a Swedish-speaking university was founded in Aabo, with theological and other faculties, including a natural science faculty and a chemical-technical faculty. Two years later a rival university was founded for the benefit of Finnish-speaking students, who for the first time in the history of the country were enabled to pursue high school studies in their native tongue. The plan to create a medical faculty at the university was held in abeyance for several years for want of adequate financial support. In September, 1940, a government committee set to work to study the creation of a medical faculty centering about the new city hospital, which had been completed in 1938 and which now has more than 500 hospital beds.

On June 8, 1943, the new medical faculty of Aabo University came formally into being. As pointed out by Prof. O. [illegible] enjoys to a certain extent the status, privileges, and independence of a university, but it must in the main be regarded as an institution under the state, which supports the whole of the faculty's budget with the exception of administrative expenses. In addition to the hospital already referred to, the faculty of medicine can draw on the town's fever hospital, maternity hospital, tuberculosis hospital, and mental hospital (which alone has 290 beds) for clinical and teaching material. The faculty has already its own pathology, bacteriology, and serology departments, and accommodation is being provided for the study of pharmacology, public health, and forensic medicine. The preliminary studies in biochemistry, physiology and anatomy must be pursued at the University of Helsingfors until Aabo can deal with these subjects also.

BRAZIL

Accidents in Children.—Drs. Orlano V. Orlandi and [illegible] Almeida, of the Pediatrics Department of the Rio de Janeiro Policlinica Geral, prepared a report on the problem of accidents in children from 5 to 14 years in Rio de Janeiro. In the first part of the report the authors analyze the mortality from accidents, comparing the figures for the years 1931, 1941, and 1950; in the first two years, deaths from accidents occupied third place among the five most important causes of death in the age group 5 to 14 years, while in 1950 they reached first place among the causes of death in the same group. This fact, however, does not express the real situation, because the mortality rate from accidents in that age group remained approximately the same (5.2 per hundred thousand in 1931, 5.8 in 1941, and 5.5 in 1950), while the rate for all other important causes of death declined during the period of time examined. Tuberculosis of the respiratory organs, which ranked first in 1931 with the rate of 6.4 per hundred thousand, declined to 3.8 in 1950; pneumonia and bronchopneumonia, which were the second cause in 1931, with 6.0, declined to 2.7 in 1950; and nephritis declined from 3.0 in 1931 to less than 1.0 in 1950.

The second part of the report is devoted to an analysis of the total 5,643 cases of accidents in children below 15 years of age attended in 1949 at the Carlos Chagas General Hospital, which serves the northwest peripheral district of the city, inhabited by people belonging to the middle and low economic segments of the population. The percentual age distribution of the patients between 0 and 14 years shows a rapid rise from 1.5% for children of less than 1 year, to 5.3% for those of 1 year, 7.0% for those of 2 years, and 8.0% for those of 3 years, and then a slow and regular decline to about 6.0% for those of 14 years. The distribution of the accidents according to the hour of the day shows that about 95% of them occur between 9 a. m. and 8 p. m., the peak of the distribution being between 3 and 7 p. m. The worst day of the week is Saturday, which shows an average of about 17 cases per day (daily average for the year 15.5 cases) as against a minimum of 14.3 for both Thursday and Friday; Sunday is more or less an average day. As for the kind of accident, fall is the most important one (37.5% of the cases), followed by accidents caused by cutting, bruising, and perforating objects (27.4%), biting by animals (16.3%), burns (5.2%), vehicle accidents (5.2%), foreign bodies (3.7%), and poisoning (0.9%). The distribution of the cases according to the kind of surgical lesions presented by the patients shows that sections, contusions, and bruises occupy first place (70.5%), followed by fractures (14.3%), burns (5.2%), dislocations and sprains (1.9%) and crushing and traumatic amputations (0.3%). The 3,064 cases of sections, contusions, and perforations were divided as follows: abdominal limbs 1,520 (677 of the sole of the foot), head and

1,013, thoracic limbs 426, and trunk 105. The animal bites as follows: dog, 870; cat, 27; monkey, 14; and other als, 11. According to the age of the children, the 51 cases isoning were divided as follows: 0-4 years, 45; 5-9 years, d 10-14 years, 4. The ingested substances that caused the cases of poisoning were kerosene and gasoline (21 cases), non medicines (16 cases), chlorine domestic solutions (6), and furniture polishing preparations (2 cases).

rimental South American Leishmaniasis.—All forms of hu- leishmaniasis are found in South America—the generalized sceral infection (kala-azar), the localized form affecting the alone, and the localized form affecting concomitantly the nd mucosa. The etiological agent of the first form, which is ease with capricious geographic distribution, was named mania chagasi by Da Cunha and Chagas, in 1937. The local- forms are considered the same disease, caused by L. brasili- which some authorities believe to be identical with L. ca (Wright, 1903). F. Nery Guimarães, of the Oswaldo Cruz ute, in 1947, reported the visceral infection produced by L. liensis in hamsters. In a new paper, the author reports the ion of five more strains from different sections of Brazil, of them from patients with mucocutaneous lesions ndia), and all of them causing also generalized lesions in ters. In his latest experiments, Guimarães inoculated 61 ters with the six strains taken directly from the patients: ere inoculated intraperitoneally, of which 38 showed vis- ization (92.7%), and 20 subcutaneously, of which 19 showed ralization (95%). The visceralization in hamsters is prin- ly found in the reticuloendothelial system, i. e., in spleen, bone marrow, lymph nodes, but other organs were also itized: skin, testis (vaginal), intestines, lung, brain, striated les. With four of the above referred strains, the author pro- d visceral infections in white mice, although the lesions were o extensive and severe as those provoked in hamsters by ame organism. No lesions were observed in the site of in- tion. The lesions obtained were indistinguishable from those uted to L. donovani. Similarly, both black and agouti mice ed susceptibility to L. brasiliensis. Cotton rats showed only visceral infection. Dr. Guimarães believes that the evidence sceralization of a strain of Leishmania taken directly from cutaneous lesions, although in experimental conditions, rms the opinion of Hoare in the concept of the species of rotozoa of the genus Leishmania which, up to the present, been differentiated on clinicoepidemiological bases.

uction of Schistosoma Cercariae by Soaps and Dyes.—The uction of cercariae in water is one of the prophylactic meas- to control schistosomiasis, since infestation is brought about e contact of the skin with water containing larvae in their swimming stage. Drs. Genesio Pacheco and Geth Jansen, e Oswaldo Cruz Institute, experimented with several sub- es to find the best means of achieving such destruction. report that infested snails (Planorbis olivaceus) in the stage liminating Schistosoma mansoni cercariae were placed in vater and exposed to sunlight in order to stimulate elimina- When there was a sufficient number of larvae to permit easy tion under the microscope, the substance to be tested was d and the alterations observed, the larvae being considered only when completely immobilized. The experiments were e under diffused daylight. In the first series of experiments, uthors tested sodium oleate and sodium ricinoleate in 10% ion, which caused complete immobilization after a period me inversely proportional to the concentration (about 24 s with a 1:1,000 solution and only 10 minutes with 1:50). dine orange and brilliant green were tested in the second s of experiments, the former dye immobilizing the larvae minutes with 1:50,000, and the latter after six minutes with 00. The third series of experiments was carried out with association of a soap and a staining material, in order to rtain whether this could increase the larvicidal action. In fact, mixture of sodium oleate (10% solution) with acridine 000) increased the larvicidal activity enormously—the im- ilization of the cercariae was obtained with the concentration :500,000 after 10 minutes, and with the concentration of 00,000 after 17 minutes. The mixture is effective even if during 24 hours at the laboratory temperature, but the lar- lal properties are slightly reduced in the presence of organic ter as was verified by the addition of 20% of horse serum.

Murine Encephalomyelitis.—Many workers in several countries are studying virus diseases of animals as a means of advancing our knowledge about virus diseases of man. In Rio de Janeiro, Drs. A. Borges Fortes and Herminio Linhares, of the National Service of Mental Diseases, reported on a new series of studies on natural and experimental cases of murine encephalomyelitis and described some important pathologic features. They observed an extensive acute and subacute inflammatory process, chiefly of the leptomeninges, the choroid plexuses, and the encephalic axis, characterized by infiltration of round cells, with a diffuse perivasculitis and some granulomas. Considerable exudation in the lateral ventricles in the inoculated animals was also noticed. Evident inflammatory phenomena followed by degeneration and atrophy of substantia grisea of the spinal cord were also observed, more noticeable on the anterior cornu. The encephalic lesions found in mice, principally those of the experimental form of Theiler's encephalomyelitis, are similar to those of acute lymphocytic choriomeningitis in man. The observed lesions of the spinal cord in this murine disease are similar to those which have been described in acute anterior poliomyelitis in man.

ARGENTINA

Congress on Cancer.—The first Argentine Congress on Cancer was held in Buenos Aires, September 24-27, under the presidency of Dr. Abel Canonico and sponsored by the Ministry of Public Health. It was attended by specialists from the United States, Chile, Uruguay, Paraguay, Bolivia, and Spain, who had been invited by the Argentine government. Several communications were presented, and there were surgical demonstrations.

From September 26 to 29 the first National Conference on Cancer was held, organized by the Ministry of Public Health, which established a unified and coordinated plan against cancer in the Argentine republic. A commission of pathologists was also appointed for the task of establishing uniformity in nomenclature of tumors and the diseases associated with this development. Improvement of present knowledge on cancer through postgraduate courses was recommended to stimulate investigations and organize an extensive sanitary campaign all over the country.

Pulmonary Tuberculosis Mortality Rate.—In 1918 there were in Argentina 15,149 deaths due to pulmonary tuberculosis. This was the highest rate reported; the rate remained high until 1938 and then decreased progressively to 1948. During 1948 there were only 9,470 deaths due to this disease.

In 1918 there were 174 deaths per 100,000 persons. In 1948 there were only 57 deaths per 100,000 persons. The general mortality rate reached its maximum in 1919 (17.5 deaths per 100,000 persons). In 1948 the death rate was 9.9. In Buenos Aires this reduction was greater. The death rate in 1918 was 245 per 100,000 persons.

Spiritualism.—Spiritualism has never been officially approved and has not been allowed as a therapeutic measure. Recently physicians were surprised by an announcement of the Ministry of Public Health in which it was established that the Division of Social Psychopathology must register the member societies of the Argentine Association of Spiritualists and accept them. A monthly report of members, mediums, associates, and meetings must be forwarded. Persons acting as mediums should have a certificate of technical ability granted by the Division of Social Psychopathology of the Ministry of Public Health after a psychologic, metapsychologic, and psychiatric examination.

Malaria Control.—After the employment of 102 tons of DDT and 2,000 tons of kerosene (as solvent) malaria practically disappeared in the zones of the country in which this disease was endemic. Up to 1947, there were about 300,000 cases of malaria per year, according to the report by Dr. Carlos A. Alvarado in the first Argentine Epidemiological Meetings. After three years of prophylaxis, only 653 cases were observed in 1950, with no cases of first infection. Eighty-four teams (500 persons) carried out the task of spraying DDT and kerosene in 170,000 buildings. Dr. Alvarado claimed that malaria was now neither a social nor a sanitary problem in the northern Argentina.

CORRESPONDENCE

MEDICAL-LEGAL ASPECTS OF ARTIFICIAL INSEMINATION

To the Editor:—I was greatly interested in your extensive review of the medicolegal aspects of artificial insemination. However, I was disappointed to see no reference made to the fact that the Medical Jurisprudence Society of New York City had discussed the medicolegal aspects of this subject on March 13, 1944, and again on Feb. 9, 1948. The latter was published in *Human Fertility* (**13:**37 [June] 1948). The former presentation is appearing in the proceedings of the Medical Jurisprudence Society shortly to be published by Charles C Thomas, Publisher. By invitation, I presented the subject on both occasions.

I must disagree with certain provisions of the consent form of L. J. Regan in THE JOURNAL (**147:**253 [Sept. 15] 1951), namely: "Nor any other information concerning said donor's race, nationality, characteristics, qualities, or any other information whatsoever concerning said donor." I believe that a couple have the right to know the nationality, race, characteristics, education, and religion of the donor if they request such information.

I believe that it would be very impractical for a physician to destroy confidential records regarding a donor and the patient treated, and I cannot agree with the paragraph: "We further agree that following the said insemination the said Dr. . . . shall destroy all information and records which he may have as to the identity of said donor it being the intention of all parties that the identity of said donor shall be and forever remain anonymous." My reason for insisting that it is advisable to keep such records is to assure whenever possible the same donor for second or third requests for artificial insemination. In my series of 200 patients treated by donor artificial insemination, 36% requested a second pregnancy and 5% requested a third pregnancy. The patients have always requested the same donor if possible. The reason is self-evident. Furthermore, as mentioned in your article, the Sanitary Code of New York City demands that records of the donor be kept.

I should like to plead for physicians to avoid the use of so-called semen donor services from laboratories which furnish semen on demand from sources unknown to the physician. This practice should be declared illegal, as the hereditary background, physical appearance, nationality, religion, education, and complexion cannot be satisfactorily matched by such a method. Finally, many physicians are unaware of the Rh factor of the donor and may make use of an Rh positive donor's semen to impregnate an Rh negative woman.

MARIE PICHEL WARNER, M.D.
20 West 86th St., New York 24.

The above letter was referred to the author of the article, who has written as follows:

To the Editor:—The difficulty inherent in the production of the suggested form, or of any form purporting to authorize artificial insemination, is obvious, since there is a total lack of statutory law and, practically, of case law. The terms of any such form are evidently subject to criticism, since, at best, they rest on opinion.

With its present unestablished legal status, even if not specifically contrary to law, the practice of artificial insemination with a donor other than the husband is hazardous to the physician who performs it—hazardous because of the possibility of involvement in litigation.

Inherent in the problem, there are at this time many undetermined factors, among them questions of inheritance, support, right of control, adultery, rights of the donor's spouse, and standards of care respecting selection and fitness of donor. The provision of the Sanitary Code of the City of New York referred to is essentially a public health regulation requiring that certain examinations be made of donors.

The suggested form might, although it is not claimed it will, afford some protection to a physician who makes it. A portion of its protective potential would, in my opinion, be lost if it is modified as suggested by Dr. Warner.

LOUIS J. REGAN, M.D.
1925 Wilshire Blvd., Los Angeles

N.P.C. GIFT TO EDUCATION FOUNDATION

Elmer L. Henderson, M.D.
Office of the President
American Medical Education Foundation
535 North Dearborn Street
Chicago, Illinois

Dear Dr. Henderson:

The members of the Board of Trustees of N.P.C., met in Atlantic City on June 10th—all members present, voted to place at the disposal of the American Medical Education Foundation the residue of funds in the treasury of the National Physicians Committee. This residue was to result from the payment of all obligations and certain other commitments made by the Board. After all payments were made there was a balance of $11,222.94. A check in this amount is attached.

During the later years of the operation of N.P.C. you were thoroughly familiar with its aims, purposes and its operations. Without detracting in any way from subsequent actions we it can be safely said that the continuous aggressive and unremitting efforts of the N.P.C., over a period of nearly ten years made possible preserving the independence of the profession during a period of stress. These activities made acceptable subsequent assessment on the entire membership which, in turn, led to more comprehensive efforts and more determined resistance.

You personally are thoroughly familiar with the incidents and circumstances that led the Board of Trustees of the N.P.C. to the decision to remove itself from the field of operations and liquidate its assets. We, speaking for the Board of Trustees of the N.P.C., are pleased that we were able, in a time of emergency, to render valuable aid and that its operations were so conducted as to make possible placing at your disposal the contribution enclosed herewith. Legal requirements involved in the final dissolution of the National Physicians Committee precluded the possibility of earlier presentation of this contribution.

NATIONAL PHYSICIANS COMMITTEE FOR E.M.S.
EDWARD H. CARY, Dallas, Chairman
WILLIAM F. BRAASCH, Secretary
Rochester, Minn.

ECTOPIC URETER

To the Editor:—In answer to a plea in THE JOURNAL (130:1 [April 20] 1946) for awareness of the possibility of ectopic ureter in cases of urinary incontinence, I am reporting the first case of this condition diagnosed in Brazil. The patient, a 20-year-old woman, had a supernumerary left ureter opening into the vestibule. Heminephrectomy resulted in a cure. Details of the case were described in *The Journal of the International College of Surgeons* (**15:**715 [June] 1951).
